COAL INDUSTRY COMMISSION.

VOL. II.

REPORTS

AND

MINUTES OF EVIDENCE

[and appendices, charts, and index.]

ON THE

SECOND STAGE

OF THE INQUIRY.

Presented to Parliament by Command of His Majesty.

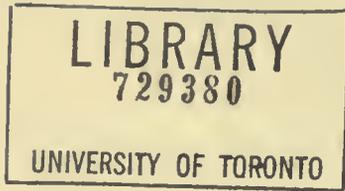

LONDON:
PRINTED AND PUBLISHED BY
HIS MAJESTY'S STATIONERY OFFICE.

To be purchased through any Bookseller or directly from
H.M. STATIONERY OFFICE at the following addresses:
IMPERIAL HOUSE, KINGSWAY, LONDON, W.C.2. and 28, ABINGDON STREET, LONDON, S.W.1;
37, PETER STREET, MANCHESTER; 1, ST. ANDREW'S CRESCENT, CARDIFF;
23, FORTH STREET, EDINBURGH;
or from E. PONSONBY, LTD., 116, GRAFTON STREET, DUBLIN.

TABLE OF CONTENTS.

	Page
1. List of Commissioners	iii
2. Reports, dated 20th June, 1919, on the Second Stage of the Inquiry	
(1) by the Honourable Mr. Justice Sankey, G.B.E. (<i>Chairman</i>)... ..	iv
(2) by Mr. Frank Hodges, Sir Leo Chiozza Money, Messrs. Robert Smillie, Herbert Smith, R. H. Tawney, and Sidney Webb	xiii
(3) by Messrs. Arthur Balfour, R. W. Cooper, Sir Adam Nimmo, K.B.E., Sir Allan M. Smith, K.B.E., and Mr. Evan Williams	xiv
(4) by Sir Arthur Duckham, K.C.B., M.I.C.E.	xxii
3. List of Witnesses who gave Evidence before the Commissioners on the Second Stage of the Inquiry.	xxix
4. Minutes of Evidence (Second Stage)	415

The Reports of the Commissioners are also obtainable under the following Command Numbers :—

First Interim Report, dated 20th March, 1919, by THE HONOURABLE Mr. JUSTICE SANKEY, G.B.E. (*Chairman*), Mr. ARTHUR BALFOUR, SIR ARTHUR DUCKHAM, K.C.B., M.I.C.E., and SIR THOMAS ROYDEN, BART., M.P. [Cmd. 84.]

” ” ” Messrs. R. SMILLIE, FRANK HODGES, HERBERT SMITH, SIR LEO CHIOZZA MONEY, Messrs. R. H. TAWNEY and SIDNEY WEBB. [Cmd. 85.]

” ” ” Messrs. R. W. COOPER, J. T. FORGIE, and EVAN WILLIAMS. [Cmd. 86.]

Second Stage Reports, dated 20th June, 1919. [Cmd. 210.]

The Minutes of Evidence on the First Stage of the Inquiry are obtainable under Cmd. 359.

The Appendices to the Evidence (both stages) are obtainable under Cmd. 361.

1. LIST OF COMMISSIONERS.

THE HONOURABLE MR. JUSTICE SANKEY, G.B.E. (*Chairman*).

ARTHUR BALFOUR, ESQ.

R. W. COOPER, ESQ.

SIR ARTHUR DUCKHAM, K.C.B., M.I.C.E.

FRANK HODGES, ESQ.

SIR LEO CHIOZZA MONEY.

SIR ADAM NIMMO, K.B.E., (in place of J. T. FORGIE, ESQ., resigned).

ROBERT SMILLIE, ESQ.

SIR ALLAN M. SMITH, K.B.E.

HERBERT SMITH, ESQ.

R. H. TAWNEY, ESQ.

SIDNEY WEBB, ESQ.

EVAN WILLIAMS, ESQ.

ASSESSORS TO THE COMMISSION.

S. J. CHAPMAN, ESQ., C.B., C.B.E.

SIR ARTHUR LOWES DICKINSON.

SIR RICHARD A. S. REDMAYNE, K.C.B., M.I.C.E.

H. J. WILSON, ESQ., C.B.E.

Secretary : MR. ARNOLD D. MCNAIR, C.B.E.

Assistant Secretary : MR. GILBERT STONE.

(1) Report by The Honourable Mr. Justice Sankey, G.B.E. (*Chairman*).

Dated 20th June, 1919.

TO THE KING'S MOST EXCELLENT MAJESTY.

MAY IT PLEASE YOUR MAJESTY.

I HAVE the honour to present a further Report in pursuance of the Coal Industry Commission Act, 1919.

1. RECOMMENDATIONS.

I.

I recommend that Parliament be invited immediately to pass legislation acquiring the Coal Royalties for the State and paying fair and just compensation to the owners.

II.

I recommend on the evidence before me that the principle of State ownership of the coal mines be accepted.

III.

I recommend that the scheme for local administration hereinafter set out, or any modification of it adopted by Parliament, be immediately set up with the aid of the Coal Controller's Department, and that Parliament be invited to pass legislation acquiring the coal mines for the State, after the scheme has been worked for three years from the date of this Report, paying fair and just compensation to the owners.

IV.

The success of the industry, whether under private or State ownership, depends upon productivity and upon everyone doing his best. The alarming fall in output has convinced me that at present everyone is not doing his best. I am not able to say whether this is the fault of the management or of the workers or of both. Each blames the other. The cause must be investigated, but, whatever it may be, it is hopeless to expect an improvement in the present atmosphere of distrust and recrimination. My prescription is the old proverb, "Plenty of work and a heart to do it."

V.

I make this Report because I believe that the workers at present employed can and will maintain an output of 250,000,000 tons a year at least, which was the

figure adopted in the Interim Report of March 20th last, presented by me and my three colleagues. I rely upon the honour of the men's leaders and of the men and of all others concerned to achieve this result. In my opinion it can and ought to be done. If the output per man continues to go down the supremacy of this country is in danger.

VI.

I recommend the continuance of the Coal Control for three years from the date of this Report.

VII.

I repeat paragraph XIX of the Interim Report of March 20th above referred to. The question of State ownership is one of policy to be determined by Parliament in which all classes, interests, and industries are represented.

2. REASONS FOR STATE OWNERSHIP OF COAL ROYALTIES.

VIII.

Coal is our principal national asset, and as it is a wasting asset it is in the interest of the State that it should be won and used to the best advantage.

IX.

The seams of coal are now vested in the hands of nearly 4,000 owners, most of whom are reasonable, but some of whom are a real hindrance to the development of the national asset.

X.

In certain areas the ownership of the seams of coal is in the hands of many small owners some of whom cannot be found, and this causes great delay and expense in acquiring the right to work the mineral.

XI.

Barriers of coal are left unworked between the properties of various owners to an extent which, in many cases, is not necessary for safe and proper working of the individual concern, and millions of tons of the national asset are thereby wasted.

XII.

Drainage and pumping are carried on in individual pits at heavy unnecessary expense instead of under a centralised plan covering a whole area. Further, lack of co-operation in drainage has in the past been, and is at the present time, conducive to the abandonment of coal and collieries.

XIII.

Boundaries of undertakings are arbitrary and irregular and make coal in certain places difficult to work or not worth working.

XIV.

Plots of land are let for building and the law allows this to be done without the right of underground support, so that the coal is worked from underneath, houses are damaged, and no compensation is payable; this is not consistent with the public well-being.

XV.

Under State ownership there will be one owner instead of nearly 4,000 owners of the National asset, and the difficulties caused under the present system in regard to barriers, drainage, pumping, boundaries and support will largely disappear.

XVI.

The State ownership should be exercised through a Minister of Mines.

XVII.

The Interim Report of the Acquisition and Valuation of Land Committee has pointed out at least 14 defects arising from the present system of ownership of the seams of coal and proposes to create a new sanctioning authority vested with power to issue compulsory orders from time to time to remedy these defects as and when they are in different cases found to exist.

XVIII.

I regard as preferable to this expensive piece-meal machinery that the seams of coal should be acquired by the State once and for all in one final settlement,

together with all usual or necessary easements and rights incidental thereto, together with power to procure all such easements and rights in the future. If the State only acquires the seams from time to time it means many arbitrations, many intermediate settlements, enhanced delay, and increased cost of administration.

3. METHOD OF PURCHASE OF COAL ROYALTIES.

XIX.

The value of each individual royalty owner's interest should be assessed by Government valuers with an appeal to a specially constituted tribunal.

XX.

Such valuers should take into consideration—

- (a) the properties where coal has been developed;
- (b) potential properties where coal is known to exist and is awaiting development;
- (c) surface wayleaves and shaft rent in certain cases which destroy the amenities of the neighbouring property;
- (d) the usual royalty charged in the district for the class of coal in question;

but not—

- (e) properties in which the existence of coal is uncertain but suspected; and
- (f) underground wayleaves.

XXI.

I also suggest that Parliament in laying down the principles of valuation should consider whether it is not possible to fix a total maximum sum which would form a pool to be allocated between the various individual royalty owners in accordance with the foregoing or any other principles which Parliament may adopt. The advantage of this plan would be that the State would at once know its total maximum liability.

4. REASONS FOR STATE OWNERSHIP OF COAL MINES.

XXII.

Coal mining is our national key industry upon which nearly all other industries depend. A cheap and adequate supply of coal is essential to the comfort of individuals and to the maintenance of the trade of the country. In this respect, and in the peculiar conditions of its working, the coal mining industry occupies a unique and exceptional place in our national life, and there is no other industry with which it can be compared.

XXIII.

The other industries and consumers generally are entitled to have a voice in deciding the amount of coal to be produced and the price at which it is to be sold, which they have not had in the past.

XXIV.

The export trade in coal has greatly increased, and the system of competition between many private colliery owners and exporters to obtain orders frequently prevents the industry getting the full value for the article.

XXV.

The inland trade in coal has greatly increased, and the system of distribution through the hands of many private individuals prevents the consumer getting the article as cheaply as he should do. It has been estimated that there are 28,000 retail distributors of coal in the United Kingdom.

XXVI.

In other words, there is underselling in the export trade and overlapping in the inland trade.

XXVII.

Passing to another phase of the difficulty, the lack of capital in some mines and the lack of proper management in others prevent the development of coalfields and the extraction of coal to the best advantage for the benefit of the Nation.

XXVIII.

There are in the United Kingdom about 3,000 pits owned by about 1,500 companies or individuals. Unification under State ownership makes it possible to apply the principles of standardization of materials and appliances and thereby to effect economies to an extent which is impossible under a system where there are so many individual owners.

XXIX.

It may be argued that the foregoing defects in the present system could be removed by changes in the direction of Unification falling short of State ownership.

XXX.

But a great change in outlook has come over the workers in the coalfields, and it is becoming increasingly difficult to carry on the industry on the old accustomed lines. The relationship between the masters and workers in most of the coalfields in the United Kingdom is, unfortunately, of such a character that it seems impossible to better it under the present system of ownership. Many of the workers think they are working for the capitalist and a strike becomes a contest between labour and capital. This is much less likely to apply with the State as owner, and there is fair reason to expect that the relationship between labour and the community will be an improvement upon the relationship between labour and capital in the coalfields.

XXXI.

Half a century of education has produced in the workers in the coalfields far more than a desire for the material advantages of higher wages and shorter hours. They have now, in many cases and to an ever increasing extent, a higher ambition of taking their due share and interest in the direction of the industry to the success of which they, too, are contributing.

XXXII.

The attitude of the colliery owners is well expressed by Lord Gainford, who speaking on their behalf as a witness before the Commission, stated:—"I am authorised to say on behalf of the Mining Association that if owners are not to be left complete executive control they will decline to accept the responsibility of carrying on the industry, and, though they regard nationalisation as disastrous to the country, they feel they would in such event be driven to the only alternative—nationalisation on fair terms."

XXXIII.

It is true that in the minds of many men there is a fear that State ownerships may stifle incentive, but to-day we are faced in the coalfields with increasing industrial unrest and a constant strife between modern labour and modern capital.

I think that the danger to be apprehended from the certainty of the continuance of this strife in the coal mining industry outweighs the danger arising from the problematical fear of the risk of the loss of incentive.

XXXIV.

The object to be aimed at under State ownership is national co-ordination of effort in respect of the production of the national asset and of its export and inland supply.

5. METHOD OF PURCHASE AND CARRYING ON OF THE COAL MINES.

XXXV.

It is suggested that the State should purchase all the collieries, including colliery buildings, plant, machinery, stores and other effects in and about the colliery at a fair value subject to the next paragraph.

XXXVI.

In addition, expenditure on development of the collieries (including the provision of houses) incurred after a date to be fixed and with the consent of the Controller of Coal Mines should be repaid with interest at the rate of 6 per cent. per annum from the date of the expenditure provided that if such expenditure has become remunerative before the date of the purchase, the amount of the sum payable by way of interest should be reduced by the amount of the profits earned thereon.

XXXVII.

In further addition the State should take power to purchase real and movable property directly associated with the working of the colliery not comprised in paragraph XXXV., other than the assets at the colliery, at a fair value.

XXXVIII.

In the case of composite undertakings the owners should have a right to compel the State to purchase, and the State should have the right to compel, the owner to sell the whole undertaking if, in the opinion of an arbitrator, the severance of the undertaking cannot be economically or commercially effected. By composite undertaking is meant an undertaking where a company or firm is carrying on a colliery in addition to and in conjunction with another works, *e.g.*, a colliery and a steel works.

XXXIX.

Without prejudice to the powers recommended by the last paragraph, it is a matter for careful consideration whether the coke and by-produce industry, which is at present only in its infancy, should not be allowed to remain in private ownership.

XL.

It is suggested that the bulk of the present officials engaged in the coal mining industry, including the managing directors of companies, should be offered an opportunity of remaining on at their present salaries on a 5 years' agreement together with any increases awarded from time to time.

XLI.

The Civil Servant has not been trained to run an industry, but the war has demonstrated the potentiality of the existence of a new class of men (whether already in the service of the State or not) who are just as keen to serve the State as they are to serve a private employer and who have been shown to possess the qualities of courage in taking initiative necessary for the running of an industry.

XLII.

Hitherto, State management of industries has on balance failed to prove itself free from serious shortcomings, but these shortcomings are largely due to the neglect of the State to train those who are to be called on for knowledge and ability in management.

XLIII.

The experience of the last few years has, however, shown that it is not really difficult for the British nation to provide a class of administrative officers who combine the strongest sense of public duty with the greatest energy and capacity for initiative. Those who have this kind of training appear to be capable in a high degree of assuming responsibility and also of getting on with the men whom they have to direct.

XLIV.

Finally, under State ownership it is always possible to lease a mine to particular persons on terms agreeable to those who are engaged in the production of coal thereat, and this principle can be applied not only to a mine or a group of mines contained in a particular district, but to a composite undertaking.

N.B.—If and when the coal mines are acquired by the State any just claims of pioneer boring companies should be recognised, and the State should take power to carry out exploratory borings.

6. THE SCHEME FOR LOCAL ADMINISTRATION.

N.B.—The propositions put forward in this scheme must not be regarded as recommendations, nor does the scheme aim at being comprehensive. The time at my disposal only allows me to make suggestions which it is hoped will be useful to Parliament.

Index to Scheme.

(i) Local Mining Council	XLV-LIII.
(ii) District Mining Council	LIV-LXIV.
(iii) National Mining Council	LXV-LXXII.
(iv) Finance and Publicity	LXXIII-LXXVIII.
(v) Safety, Health and Research	LXXIX-LXXXV.
(vi) Admiralty Coal	LXXXVI.
(vii) Export Trade	LXXXVII-LXXXIX.

(i) THE LOCAL MINING COUNCIL.

N.B.—The object of this part of the scheme is to take advantage of the knowledge of the workers by allowing them to sit on the Councils for the purpose of advising the manager and to give them an effective voice in all questions where their own safety and health are concerned.

XLV.

Every mine shall be under one duly certificated manager who shall be responsible for the control, management, direction and safety of the mine and the extent and method of working, provided always that such manager shall not be personally liable for conforming to any lawful order for safety made by the District Mining Council.

XLVI.

There shall be established at each mine a Local Mining Council who shall meet fortnightly, or oftener if need be, to advise the manager on all questions concerning the direction and safety of the mine.

XLVII.

The Council shall consist of 10 members of whom the manager, under-manager and the commercial manager shall be *ex officio*. Four members shall be elected by ballot by the workers in or about the mine and the remaining 3 members shall be appointed by the District Mining Council. The members shall hold office for 2 years.

XLVIII.

It shall be the duty of the Council to report fortnightly to the Minister of Mines and to the District Mining Council any fall in output and the cause thereof.

XLIX.

If the manager refuses to take the advice of the Local Mining Council on any question concerning the safety and health of the mine such question shall be referred to the District Mining Council.

L.

The contracts of employment of workmen shall embody an undertaking to be framed by the District Mining Council to the effect that no workman will, in consequence of any dispute, join in giving any notice to determine his contract, nor will he combine to cease work, unless and until the question in dispute has been before the Local Mining Council and the District Mining Council and those Councils have failed to settle the dispute.

LI.

There shall be a commercial manager of the mine or group of mines (which office, if the District Mining Council think fit, shall be vested in the mine manager) whose duty it shall be, subject to the control of the manager, to arrange for the purchase and supply of stores in the mines and to take steps subject to the control of the district commercial manager for the disposal of its output.

N.B.—It is thought that some of the present managing directors of companies might be appointed the commercial managers.

LII.

Each mine shall send in a costing account in the approved form to the District Mining Council.

LIII.

The workers at each mine shall be entitled to an output allowance to be ascertained in an approved manner and divided among them half-yearly.

(ii.) THE DISTRICT MINING COUNCIL.

N.B.—The object of this part of the scheme is to prevent the bureaucratic running of the industry by causing it to be controlled locally by a Council of fourteen, upon which there is equal representation for the miners, for the consumers, and for the persons acquainted with the commercial and technical side of the industry.

LIV.

There shall be established in each mining district a District Mining Council upon whom shall rest the main executive responsibility of taking measures to secure the health and safety of the workmen and the production of coal in the district.

N.B.—It is suggested that the mining districts be:—

1. Scotland, East.
2. Scotland, West.
3. Northumberland.
4. Durham
5. Cumberland.
6. Yorkshire.
7. Lancashire and Cheshire.
8. North Wales.
9. Nottinghamshire, Derbyshire and Leicestershire.
10. Staffordshire, Worcestershire and Shropshire.
11. Warwickshire.
12. South Wales and Monmouthshire.
13. Gloucestershire, Somersetshire.
14. Kent.

LV.

The District Mining Council shall conform to any order for safety made by the Chief Inspector of Mines, or by a Divisional Mines Inspector, and shall not make an order in respect of safety which is contrary to any Act of Parliament or regulations thereunder.

LVI.

Subject to the direction of the Minister of Mines the District Mining Council shall manage in its district the entire coal extraction, the regulation of output, the discontinuance of or the opening out of mines, trial sinkings, the control of prices and the basis of wage assessment, and the distribution of coal.

LVII.

In fixing the pit-head price under State ownership the following items shall be provided for:—

- (a) a fair and just wage for all workers in the industry.
- (b) the cost of materials, &c.
- (c) upkeep and management, and development work.
- (d) interest on the Bonds to be issued as the purchase price of the coal royalties and coal mines.
- (e) the contribution towards a sinking fund to redeem the Bonds.
- (f) a profit for national purposes.

LVIII.

The District Mining Council shall be entitled to make arrangements with local authorities or with private persons (including in such term co-operative societies, companies, firms and individuals) and in country districts, if permissible, with the local railway station-master, for the sale and distribution of inland coal, and with private persons, firms and companies for the sale and distribution of export coal, and shall have power to fix from time to time the price above which coal may not be sold for household and industrial purposes.

LIX.

The District Mining Council shall consist of a Chairman and Vice-Chairman, appointed by the Minister of Mines, and twelve other members. Four members shall be elected by ballot by the workers, and the remaining eight members shall be appointed by the National Mining Council as follows:—

Four to represent consumers (of whom in iron and steel districts two at least shall represent the iron and steel trades, and in shipping districts two at least shall represent recognised coal exporters).

Two to represent the technical side of the industry, *e.g.*, mining engineering, and

Two to represent the commercial side of the industry—purchase of material and sale of output.

LX.

All members shall hold office for three years, and shall be paid a salary.

LXI.

The District Mining Council shall meet at least monthly, and oftener if need be.

LXII.

The District Mining Council shall appoint all mine managers and all commercial mine managers within its own district.

LXIII.

The District Mining Council shall appoint a commercial committee, and a commercial manager whose duty shall be, subject to the control of the commercial committee, to arrange for the purchase and supply of stores for any mine and to take steps for the disposal of the output of coal from his district.

LXIV.

The contracts of employment of workmen shall embody an undertaking to be framed by the District Mining Council to the effect that no workman will, in consequence of any dispute affecting a district, join in giving any notice to determine his contract, nor will he combine to cease work, unless and until the question in dispute has been before the District Mining Council and the National Mining Council and those Councils have failed to settle the dispute.

(iii) THE NATIONAL MINING COUNCIL.

N.B.—The object of this part of the scheme is to get a body composed of members of the District Mining Councils who shall meet at stated intervals to discuss and advise the Minister of Mines on all questions connected with the Industry. The Minister of Mines will be assisted by a Standing Committee of 18 members elected from and by the National Mining Council, who will meet regularly for the purpose of superintending the operations of District Mining Councils. The Minister of Mines will sit in and be responsible to Parliament.

LXV.

There shall be established a National Mining Council, which shall meet from time to time to discuss with and advise the Minister of Mines upon all questions connected with the operation and management of the industry.

LXVI.

The Minister of Mines shall be appointed by the Government, and shall sit in and be responsible to Parliament. Such Minister shall superintend the operation of the District Mining Councils and shall preside over the National Mining Council.

LXVII.

The National Mining Council shall be formed as follows:—Each District Mining Council shall elect one member for every 5,000,000 tons of output, provided that every district shall elect at least one member.

LXVIII.

The members shall be elected for three years and shall meet once a year in London, once a year in Edinburgh, and once a year in Cardiff and at such other times as summoned by the Minister of Mines. Members shall be entitled to their travelling expenses.

LXIX.

There shall be elected from and by the members of the National Mining Council a Standing Committee of 18, six of whom shall retire each year and shall not be eligible for re-election for the next year. Six shall represent the workers, six shall represent consumers, and six the technical and commercial side of the industry.

LXX.

The Minister of Mines shall be entitled, after consulting the Standing Committee to veto any resolution come to either by a Local Mining Council or a District Mining Council, and in the event of his doing so he shall state publicly his grounds for so acting.

LXXI.

No national alteration of wages shall be made without the consent both of the Minister of Mines and the Standing Committee.

LXXII.

The contracts of employment of workmen shall embody an undertaking to be framed by the District Mining Council to the effect that no workman will, in consequence of any national dispute, join in giving any notice to determine his contract, nor will he combine to cease work, unless and until the question in dispute has been before the National Mining Council and that Council has failed to settle the dispute; provided that on the written request of 15 members of the National Mining Council the Minister of Mines shall convene a meeting of the Council within one month.

(iv) FINANCE AND PUBLICITY.

LXXIII.

The finances of each district shall be kept entirely separate, and a return in the approved form shall be sent to the Minister of Mines once a quarter.

LXXIV.

An approved system of auditing shall be established for all accounts.

LXXV.

The Treasury shall not be entitled to interfere with or to have any control over the appropriation of moneys derived from the industry. The said moneys shall be kept entirely separate and apart from other national moneys, until the profit accruing from the industry is periodically ascertained and paid into the Exchequer.

LXXVI.

It being of vital importance that the Mines Department should be managed with the freedom of a private business, the present Civil Service system of selection and promotion by length of service, of grades of servants, of minuting opinions and reports from one servant to another, and of salaries and pensions, shall not apply to the servants attached to the Mines Department.

LXXVII.

The Minister of Mines shall cause the following statistics to be made public:—

- (a) the quarterly financial return from each district;
- (b) the output from each district;
- (c) the number of persons employed above and below ground;

- (d) the cost per ton of getting and distributing coal, showing proportion due to wages, material, management, interest, and profit;
- (e) the amount of coal produced per man per shift;
- (f) the amount of absenteeism.

LXXVIII.

Pending the acquisition of the coal mines by the State, the colliery owners shall continue to have and be subject to the rights and liabilities conferred and imposed upon them by the Coal Mines Control Agreement (Confirmation) Act, 1918, or any statutory provision that may be substituted therefor as suggested in the Interim Report of the 20th March presented by me and my three colleagues, or otherwise.

(v) SAFETY, HEALTH AND RESEARCH.

LXXIX.

For providing for safety, health and research there shall be a corps of officers, as set out in the following paragraphs.

LXXX.

For safety, the present system of Chief Inspector and Divisional Inspectors shall be continued, and such inspectors shall continue to perform the same duties as their predecessors, but the number of inspectors shall be increased and shall be in proportion either—

- (i) to the area, or
- (ii) to the number of men employed, as for example, one inspector to, say, 5,000 men.

LXXXI.

The appointment of such safety inspectors shall be made by the Minister of Mines, to whom the inspectors shall report and be responsible.

LXXXII.

For health, there shall be appointed central and local inspectors of health as distinguished from safety, who shall be charged with the superintendence of the health and convalescence of colliery workers.

LXXXIII.

The appointment of such health inspectors shall be made by the Minister of Mines, to whom the inspectors shall report and be responsible.

LXXXIV.

For research, there shall be attached to the Ministry of Mines a Research Section for the purpose of carrying out departmental research work in safety, health and economies in mining.

LXXXV.

The appointment of such research staff shall be by the Minister of Mines.

(vi) ADMIRALTY COAL.

LXXXVI.

The Admiralty and the War Office shall be entitled to requisition coal at any mine at a pit-head price equal to the lowest price charged to any consumer.

(vii) THE EXPORT TRADE.

LXXXVII.

Any person shall be entitled to purchase coal for export from any mine in the same way as he would have been entitled had such mine remained in private ownership.

LXXXVIII.

The State shall not make or give any undue or unreasonable preference or advantage to, or in favour of, any particular persons desirous of purchasing coal for export, nor shall the State subject any particular person desirous of purchasing coal for export to any undue or unreasonable prejudice or disadvantage whatsoever.

LXXXIX.

Any exporter to whom coal is sold for export shall divide all profits over 1s. per ton equally with the District Mining Council.

MISCELLANEOUS.

The Interim Report of the 20th March last presented by me and my three colleagues (paragraph 15) outlined certain units of economy and of improvement which it was suggested should receive the attention of the Commission in the near future. Having regard to the magnitude and complexity of the question of nationalisation, it has been barely possible to touch upon these other matters, but I desire very briefly to report upon these other matters, but I desire very briefly to report upon them as follows:—

- (1) *Housing*.—The matter is in the hands of the Local Government Board and (for Scotland) the Scottish Office, with whom we have conferred and who are fully alive to the peculiar urgency of the problem in certain mining districts. I associate myself with the remarks of my friend Sir Arthur Duckham in paragraphs xi and xii of his Report.
- (2) *Baths and Drying of Clothes*.—I recommend that the Home Secretary should promote the necessary amendment in Section 77 of the Coal Mines Act, 1911, to make these facilities universal at collieries, and I have reason to believe that the Miners' Federation of Great Britain would exert very strong pressure to make their use almost as universal.
- (3) *Continuity of Transport from the Colliery, and Pooling of Wagons*.—I recommend that these matters should receive the earliest possible attention from the Minister-Designate of Ways and Communications (Sir Eric Geddes) as soon as his Department is fully constituted.
- (4) *Clearance*.
- (5) *Reduction of Voluntary Absenteeism*.
- (6) *Use of Machinery in Mines*.
Coal-cutting.
Coal-conveying,
Underground transit.
- (7) *Elimination of unnecessary Distribution Costs*.—I recommend that these matters should receive the early attention of an authority having the necessary technical and commercial qualifications such as the Advisory Board of the Controller of Coal Mines and his Department.

This Report does not apply to Ireland.

The evidence will be published separately.

The learned counsel who watched the proceedings on behalf of the Royalty Owners and of the Mining Association of Great Britain on page 6 of his printed speech formulated the question awaiting our decision as follows:—

“What changes should in the national interest be made, and when, by legislation or otherwise, in the organisation of the coal-mining industry”?

I agree that the question is a proper one and have endeavoured to answer it.

I desire to express my personal thanks, and the obligation I am under, to Sir Richard Redmayne and Sir Arthur Lowes Dickinson, two of our Assessors, and to Mr. Arnold McNair, our Secretary, and Mr. Gilbert Stone, our Assistant Secretary, for the great help I have received from them in the preparation of this Report and throughout the enquiry. They are Government officials and the Report does not necessarily express their views.

All of which I humbly report for Your Majesty's gracious consideration.

JOHN SANKEY.

ARNOLD D. McNAIR,
Secretary.

GILBERT STONE,
Assistant Secretary.

20th June, 1919.

- (2) Report by Mr. Frank Hodges, Sir Leo Chiozza Money, Mr. Robert Smillie, Mr. Herbert Smith, Mr. R. H. Tawney, and Mr. Sidney Webb.

Dated 20th June, 1919.

TO THE KING'S MOST EXCELLENT MAJESTY.

MAY IT PLEASE YOUR MAJESTY.

WE have the honour to present a further Report in pursuance of the Coal Industry Commission Act, 1919.

As we are in substantial agreement with the Chairman's Report, we think it unnecessary to set forth any separate statement of our views. But in assenting to that Report we wish to emphasise the following points, namely:—

- (1) We suggest that, with a view to securing the cordial co-operation of the workers in the success of the industry, it is necessary to provide for a fuller representation of the workers on the District and National Councils, on the lines indicated in the scheme submitted by Mr. W. Straker.

- (2) Whilst fully recognising the necessity of working rules, and the importance of preventing unnecessary stoppages, we feel that the provisions of Paragraphs L., LXIV., and LXXII. may be used to impose upon the workers by law a particular form of contract, without their consent—an innovation to which we think it will be difficult to gain agreement, and which we believe to be not the best calculated to attain the object.
- (3) We are of opinion that all coke and by-product plant attached to collieries should be treated as part of the coal mines and should be acquired by the State with the coal mines.
- (4) We think it important that whatever payment is made to the owners pending the general acquisition of the mines should not be computed upon the tonnage gotten.
- (5) Whilst recognising, with regret, that the output from the mines has not yet satisfactorily recovered from the adverse circumstances which have depressed it during the war, we wish to emphasise the fact that no evidence has been produced to show that the men are refraining from doing their best. We believe that this is not the case, and that other causes are at work. The miners demand an immediate inquiry, and we support this demand. During the period that must necessarily elapse before the institution of the machinery for the administration of the mines proposed by the Chairman, we think that it is of the utmost public importance that there should be no deficiency of tubs, no lack of wagons, no shortage of materials and no obstacle to prompt clearance from pithead, all of which are reported now to exist.
- (6) Three among us (F. Hodges, R. Smillie, and Herbert Smith) do not agree that any compensation whatever should be paid to the present mineral owners for the mineral rights to be acquired by the State. But this must not be taken to imply that there would be objection to the grant of compassionate allowances in cases in which small royalty owners are expropriated in such a way as to deprive them of their means of livelihood.

We cordially associate ourselves with the Chairman in his tribute of thanks to the Assessors and Secretaries for the invaluable help they have given the Commission in conducting the enquiry.

All of which we humbly report for Your Majesty's gracious consideration.

ROBT. SMILLIE.
FRANK HODGES;
HERBERT SMITH.
LEO CHIOZZA MONEY.
R. H. TAWNEY.
SIDNEY WEBB.

20th June, 1919.

- (3) Report by Messrs. Arthur Balfour, R. W. Cooper, Sir Adam Nimmo, K.B.E., Sir Allan M. Smith, K.B.E., and Mr. Evan Williams.

Dated 20th June, 1919.

TO THE KING'S MOST EXCELLENT MAJESTY.

MAY IT PLEASE YOUR MAJESTY.

We have the honour to present our Report in pursuance of the Coal Industry Commission Act, 1919.

The second stage of the inquiry which began on the 23rd April last involved the examination of 116 witnesses.

2. The main questions with which we have to deal are those set forth in paragraphs (f), (g) and (h) of Section 1 of the Act by which we are required to enquire into:—

- (1) Any scheme that may be submitted to or formulated by the Commissioners for the future organisation of the coal industry, whether on the present basis, or on the basis of joint control, nationalisation or any other basis;
- (2) The effect of the present incidence of and practice with regard to mining royalties and wayleaves upon the coal industry and the cost of coal and whether any and what changes in these respects are desirable;
- (3) The effect of proposals under the above heads upon the development of the coal industry and the economic life of the country.

The Future Organisation of the Coal Industry.

3. The schemes which have been submitted involve the fundamental question of whether the coal industry is to be organised on the basis of private ownership or on the basis of nationalisation.

Three definite schemes have been submitted in evidence. The first scheme is in substance the same as that contained in a pamphlet put in evidence before us entitled "The Nationalisa-

tion of the Coal Supply," which originally constituted a chapter of a book called "How to pay for the war," published in July, 1916. One of the authors of this book is Mr. Sidney Webb, one of the Commissioners, who gave evidence before us, repeating in substance the proposals contained in the pamphlet.

4. The second scheme is contained in a draft of a proposed parliamentary Bill prepared on behalf of the Miners' Federation of Great Britain.

5. The third scheme was submitted by Lord Gainford in his evidence on behalf of the Mining Association of Great Britain.

The Scheme of Mr. Sidney Webb.

6. By this scheme it is proposed to put an end to the private ownership and working of coal by vesting the coal and the collieries in the State and paying compensation to the owners by means of an issue of Government Stock.

7. The scheme proposes that the State should buy out all persons interested, whether as lessees or workers of coal or as lessors or royalty owners, and this was practically repeated in the evidence given by Mr. Sidney Webb, who treats the fair selling value based on pre-war income of the properties as the price to be paid by the State to the expropriated owners.

The Bill of the Miners' Federation.

8. This Bill, like the scheme of Mr. Sidney Webb, proposes to put an end to private ownership and working of coal, but there are essential differences between the two schemes, which may shortly be described as follows:—

The Bill proposes:—

- (a) To expropriate the owner not only of the coal mines but also of other mines.
- (b) To confiscate without compensation all mining royalties and wayleaves and only to pay to lessees or owners of collieries a limited amount of compensation.
- (c) Instead of vesting the mines in the State, to vest them in a special body to be created and to be called the Mining Council, consisting of a President appointed by Your Majesty and 20 members, of whom one half are to be appointed by Your Majesty and the other half by the Miners' Federation.
- (d) To transfer to the Mining Council all powers of the Secretary of State under the Acts for the regulation of Coal Mines.
- (e) To give the Mining Council at its option power to take over and carry on iron, steel and other works carried on in connection with coal mining,
- (f) To postpone indefinitely the exercise of this last mentioned option, and, meanwhile, either to prevent the carrying on of these works absolutely or to permit them to be carried on upon such terms as may be prescribed by the Council, and ultimately, at the discretion of the Council, to take over the works at their then value.
- (g) To authorise the Mining Council to carry on the business of shipowners and to prevent any increase in the rates now charged for the conveyance of coal by railway.

The Mining Association Scheme.

9. This scheme is based upon the principle that private enterprise must be maintained and that nationalisation of the coal industry would be prejudicial to the economic welfare of the country.

10. The authors contend that want of knowledge with respect to prices, costs and profits and the absence of machinery conferring upon the workers opportunities for obtaining information and influencing the conditions under which they work have been to a great extent the cause of the existing discontent.

11. The authors propose that, in future, fluctuations of the wages of the workers in each mining district, over and above the minimum rates, should, instead of being regulated solely as in the past by selling prices, be regulated by reference also to costs and profits in that district.

12. The authors propose that by means of joint committees of employers and workers full opportunity should be given to the workers in each district and at each colliery to make suggestions with respect to the methods and conditions of their work, without impairing the authority of the owner, agent or manager of the mine, upon whom the law imposes responsibility for the control, management and direction of the mine.

THE COAL INDUSTRY.

13. Neither past experience of State enterprise nor any evidence submitted to the Commission gives any reasonable ground for belief that the coal industry could or would be as efficiently conducted by the State in the future as by private enterprise in the past.

14. It is of the essence of success in industry that those who conduct it should not hesitate to take responsibility and incur commercial risks. When this is done in the coal industry, what is placed at risk is the capital—or profits of capital—made available for the very purpose of being used in a risky undertaking. On the other hand, the only justification for a Government official taking risks is grave national emergency.

15. It is an inseparable feature of departmental Government that each man instead of taking responsibility for any proposed action should pass it on to his superior; and the

final responsibility of the Department must always be Parliament. Its actions are thus inevitably governed by political considerations and the interests of political parties. We have the greatest admiration for the work which individual outsiders who joined the Government Departments during the war have performed for the country, but the system in a Government Department has the effect of depressing rather than exciting imagination, initiative and activity. Should the State engage in industry, particularly in the mining industry, which is so vitally connected with the destiny of the nation, the result would be nothing short of disaster.

16. No evidence which has been submitted to the Commission would justify us in coming to the conclusion that the benefits claimed by those who advocate nationalisation would result from any form of State ownership of the mines.

17. The danger due to political influence has been frankly admitted, but it is claimed that adequate safeguards can be provided against political interference in industry or commerce. However feasible this may appear in theory the democratic system of Government makes safeguards impossible when the exigencies of a political situation dominate a question. We have therefore come to the conclusion that the provision of safeguards against political interference is not within the region of practical politics.

18. The evidence submitted to the Commission affords no ground for belief that nationalisation would have the effect of reducing the price of coal.

19. With regard to the question of increased output and the question of avoidance of strikes, it appears to us that the attitude freely expressed on behalf of the Miners' Federation against co-operation with other Trade Unions, with the employers and with the State with respect to the proposals made by the recent National Industrial Conference creates a regrettable impression.

Without co-operation, nationalisation, even if otherwise advisable, would in no way secure increase of output or continuity of production. The evidence has clearly shown that strikes are not prevented by State ownership and management.

20. It is regrettable that during the whole of the proceedings emphasis has been laid on a state of antagonism which is alleged to exist between the employers and the workpeople in the coal industry. To such an extent is this feeling alleged to exist that it is stated that the only means of overcoming it is to nationalise the industry and to substitute the State for private enterprise.

From the evidence submitted, which is confirmed by our own knowledge, no foundation exists for such an exertion. In certain cases owing to the action of individuals, few in number but active in agitation, local unrest has been created, but we are convinced that the relations between the employers and the vast majority of the workpeople in the coal mining industry do not call for the drastic proposals that have been advanced.

21. The personal and human element which exists under present conditions would be almost entirely eliminated should the State take over the industry.

22. From the evidence submitted it is clear that the mine owners are prepared to increase the facilities for enabling the workpeople to acquire a greater knowledge of and interest in the industry.

23. We think it is only right that the community should realise the extent to which success has attended the efforts of private enterprise in the coal industry, and we would specially refer to the following extract from Lord Gainford's evidence before the Commission:—

“Coal owners have not been slow to risk their capital in the development of coal, and have taken risks which the State never could have undertaken, wherever there appeared to be any possible expectation of success. The development in output during the past 30 years prior to the war, from 128,000,000 tons to 288,000,000, and an increase in the men employed from 492,422 to 1,118,452 is eloquent testimony to the enterprise, initiative and skill which coal owners and their managers have brought to bear upon the industry. So far from necessary development having been retarded in the hands of the present owners, all available evidence shows that the full quantity of coal required from time to time by the nation has always been forthcoming, and an export trade has been steadily built up. (N.B.—16 million tons in 1873 to 82 million tons in 1913.)”

24. The advantages and disadvantages of nationalisation have been discussed at great length in the course of the evidence. Widely different and often wholly unconnected reasons have been put forward. Some of the more advanced socialists object to industry being conducted for private profit and favour the nationalisation of all industry. Nationalisation of the coal mines is openly advocated as a step towards nationalisation of all industry.

25. The support given in the evidence to the claim for nationalisation comes mainly from socialists and theorists who seem profoundly convinced that it is their prerogative to lead the nation in the direction of thought considered by them to be good for the nation.

It is noteworthy, however, that not all the theorists are of one mind on this subject.

26. The better housing of the miners, the increase of provisions for safety, and the lowering of the present high rate of infantile mortality are matters which everyone will agree should receive immediate attention: but each and all of these matters can be dealt with without resort to nationalisation of the mines, and call for careful and organised investigation and scientific and practical consideration.

27. The continued efforts to obscure the real issues involved in nationalisation by a special reference to these matters, which, while most important in themselves, are not necessarily bound up with nationalisation, coupled with the fact that nationalisation is not so much a request in

the interest of the nation, as a demand under threat of a strike, by a relatively small section of the community, give the impression that nationalisation of the mines is more of the nature of a political move and not a policy based on altruistic motives on the part of those who direct the policy of the Miners' Federation.

28. Nationalisation in terms of the proposals of the Miners' Federation would amount, on State purchase, to such an amount of control by the Miners' Federation as would remove the industry from the control of the community on whose behalf presumably nationalisation is claimed.

29. The credit of the nation from an international point of view has rested to a great extent on the nation's sound and consistent policy in maintaining the stability and security of private rights. If these private rights are assailed and subverted in accordance with certain of the extreme views expressed during the proceedings of the Commission, it is not unreasonable to suppose that the national credit will be seriously affected and that this will be reflected in the industries of the country by very serious consequences.

30. We have carefully weighed the whole of the evidence and have come to the conclusion that the nationalisation of the coal industry in any form would be detrimental to the development of the industry and to the economic life of the country.

31. It is clear that the present economic position of the coal industry cannot continue.

Wages in any industry can only continue to be paid to the extent that the industry can bear.

It is economically unsound to pay wages either:—

(a) By repayment, in the form of a wage subsidy, of taxes previously collected from an industry, or

(b) By subsidies from moneys collected from the taxpayer.

If the coal industry is to be resumed on an economic basis it is inevitable that one of two things must happen:—

(a) There must be a large increase in the output of coal and a decrease in the cost of production, or

(b) The price of coal to the consumer must be increased and the consequences of this increase upon other industries and on the community generally must be faced.

Without expressing any opinion on the subject, we feel very strongly that in view of the statements made before the Commission the causes which have contributed to the fall in output should be the subject of immediate and complete investigation.

32. We also feel strongly that no action which will vitally affect the Nation as a whole or will result in granting preferential treatment to any section of the community should be taken without first referring the question to the community.

33. Having expressed our judgment upon the issue between nationalisation and private ownership, we now beg to offer the following suggestions with respect to matters affecting the coal industry under private ownership, including the safety and well-being of the miners.

Safety.

34. There is no justification whatever for any suggestion that the mineowners have been slow to take precautions for the safety of the workers, or that considerations of profit have restricted the adoption of measures to ensure the safety of those working in the mines. Statistics furnished by the Home Office prove that the rate of accident in the coal mines in this country is lower than the rate in the coal mines of any of the other principal coal producing countries.

35. The State has prescribed the duties of the owners in these respects, and the owners have conformed to the State's requirements.

36. The initiative in invention and adoption of safety precautions has come in the past from individual collieries. The State has followed the practice of the most progressive collieries and has adopted their standard of safety and their improvements and prescribed them for the remainder of the collieries.

37. We suggest that Mines Inspection should be strengthened by an increase in the number of inspectors and that greater attention than has hitherto been given should be paid by the Government to research, investigation and provision of safety appliances.

38. We are strongly of opinion that the existing system of reporting and tabulating information as to injuries in the mines is not sufficient. Complete statistics should be procured by the Government showing the numbers and causes of accidents and the nature and extent of injuries. These statistics should be regularly and frequently published.

Housing.

39. The general question of the housing of the working classes has been for some years past engaging the serious attention of the community as a whole. This has now materialised on a national basis in the Housing and Town Planning Bill presented by the Government. It is urgently necessary that the housing of the working classes should be brought into accordance with modern ideas. The older classes of houses should be improved; new houses should be built and a greater number of houses should be provided. Particular attention should be paid

to sanitary conditions and considerations affecting the amenities of life. This, however, is a national question and includes all working-class houses, whether in colliery villages or not. We think it is regrettable that the coal trade should, in a matter of a national character and demanding national attention, have been singled out for particular reproach. We are satisfied that as a special industry the colliery proprietors have done much and would, but for the war and the consequent difficulties, have done more with regard to the housing of the workpeople employed.

Baths at Pithead and Accommodation for Clothes Drying.

40. We are of opinion that baths and accommodation for drying clothes should be provided and maintained at or near the pithead, so far as this may be possible, having regard to the practicability of obtaining a suitable supply of water.

41. We recommend the repeal of the proviso to Section 77 (1) of the Coal Mines Act, 1911, which has the effect of relieving the mine owner from the obligation to provide this accommodation if the estimated total cost of maintenance exceeds 3*d.* per week per person employed.

Research and Investigation.

42. In view of the setting up by the Government of a Council of Scientific and Industrial Research and the possibility that the activities of this Council may justify the setting up of a Department of State to deal with this matter, a branch of such Department should be set up for the purpose of arranging for and co-ordinating the research and investigation so far as affecting the working and use of coal.

It is essential that there should be the closest co-operation between the mining authority as such and the research authority as such.

It should be borne in mind that there exist at the moment many institutions and organisations set up by private enterprise which have done exceedingly useful work. It is essential that the Mining Department and the Research Department should utilise and co-ordinate the facilities afforded by these institutions and organisations.

Mines Department.

43. We recommend that a Mines Department should be set up having at its head a responsible official thoroughly acquainted with the mining industry.

44. This Department should exercise the functions of State so far as regards the ownership of coal, with which subject we deal hereinafter.

It should also have administrative functions including the functions which are at present exercised by a Mines Department at the Home Office, and it should have jurisdiction over all questions relating to the coal mines except the adjustment of labour disputes and wages, which are appropriate subjects for the jurisdiction of the Minister of Labour. For example, it should deal with questions of safety and technique; should collect and publish statistics relative to accidents, output, export and consumption; it should be a record office for data relating to the coal industry and should deal with questions affecting new coal fields and the development of existing ones.

45. In the exercise of its duty the Mines Department should be assisted by a National Advisory Council consisting of representatives of (a) the Department, (b) the colliery owners, (c) the mine workers, (d) mining engineers, and (e) other scientific experts.

Co-operation in the Coal Industry.

46. While it is essential, even in the interests of the mine workers themselves, that the Executive Authority of the Management should not be impaired, we recommend that full and regular opportunity should be given to each party to bring forward for discussion any question of mutual interest.

47. We, therefore, recommend that the following procedure should be established:—

(1) *Pit Committees.*

There should be established at each colliery a Pit Committee, consisting of equal numbers of representatives of the management and of mine workers. The numbers will probably vary in the different mines, but in no case should they exceed seven on each side. Each side should have its own Chairman. The representatives of the mine workers should be appointed by and from all the workers employed at the colliery.

The Committee should meet as occasion demands, but not less frequently than once a month, for the consideration of questions of which previous notice has, if possible, been given.

The purpose of the Pit Committee is to afford an opportunity of discussion of any question relating to the working of the mine, or the conditions under which the miners work, and any other questions in the settlement of which both parties are directly concerned.

It is hoped that through personal touch at the mine and free and friendly interchange of views, harmonious relations will be promoted and maintained.

(2) *District Councils.*

District Councils, consisting of representatives of the coal owners and representatives of the Trade Unions in the district, should be established for the purpose of dealing with

any questions of a district character which, in the opinion of the Council, it is in the mutual interest of the parties to discuss. The District Council should also deal with questions of which a settlement has not been arrived at by the Pit Committee.

Where Conciliation Boards exist for the purpose of dealing with questions on a district basis, the procedure of the Conciliation Board and the District Council might with advantage be co-ordinated or the Conciliation Board might act as the District Council for the district.

(3) *National Council.*

A National Council should be established consisting of the representatives of mine owners and mine workers appointed by the districts, for the purpose of dealing with any question of national interest which may be referred to it.

48. We have confined ourselves to indicating in general terms the lines upon which the Pit Committees, District Councils and National Council should be instituted. We recognise that the varying circumstances of the different districts and different collieries may involve variations in the constitution and procedure, but we recommend that the parties should immediately proceed to discuss a scheme of this description on the basis of the terms of the Interim Report on Joint Standing Industrial Councils by the Reconstruction Sub-Committee on Relations between Employers and Employed to which two members of this Commission are signatories.

Distribution.

49. The evidence shows that considerable saving is possible in the distribution of household coal.

An extension of dealing in household coal by co-operative effort will no doubt take place automatically.

50. We recommend that local authorities should be given statutory powers to deal in household coal, not as a monopoly, but in competition with private dealers or co-operative effort, subject to the provision that any losses sustained in such dealing shall not be chargeable to the rates.

51. Wherever consolidation of the present distributing agencies is possible it should be effected but not so as to result in combinations or trusts to the detriment of the consumer.

52. We recommend that in order that all parties interested should be afforded the opportunity of understanding and appreciating the cost and difficulties of the distribution of coal, a Consultative Committee should be set up by the Mines Department consisting of representatives of colliery owners, mineworkers, consumers and distributors. This Committee should meet regularly and discuss any points of common interest which may be brought forward by persons concerned. It may also be desirable that similar Committees similarly constituted and with similar functions should be set up in the principal mining districts.

Export Trade.

53. Many witnesses have referred to the urgent necessity of the maintenance and extension of the coal export trade, as having a most important bearing upon the international money exchange and upon the food supply of the country.

54. Even if the State did not itself engage in the export trade, a State monopoly in the production of coal would not permit that freedom of action and flexibility of decision on the part of the private coal exporter which is essential to the conduct of the trade.

55. We are satisfied that it is impracticable for the State to carry on an export trade in coal.

MINING ROYALTIES.

The Effect of the Incidence of, and Practice in regard to Mining Royalties upon the Coal Industry and the Cost of Coal.

56. There is in our judgment a radical difference between the mere ownership by the State of a national asset like coal and the conduct by the State of an industry like the coal industry whether with or without its export trade.

57. Coal is our principal national asset, and as it is a wasting asset it is in the interests of the State that it should be worked to the best advantage.

58. The ownership of the seams of coal is now in the hands of several thousand persons, most of whom have exercised their rights in a reasonable manner, but some of whom have not assisted in the development of the national asset.

59. The effect of mining royalties (including wayleaves) on the cost of coal has been, in our judgment, slight. In 1913 they amounted to 5 per cent. of the selling value at the pit-head and in 1918 to about 2½ per cent. of that value.

60. The third report of the Acquisition and Valuation of Land Committee appointed by Your Majesty's Minister of Reconstruction has pointed out a number of defects arising from the present system of ownership and proposes to create a new Sanctioning Authority invested with power to issue compulsory orders from time to time to remedy those defects as and when they are found to exist.

61. The defects as set forth by that Committee may be briefly summarised as follows:—

- (1) Owners unwilling to sell or lease.
- (2) Owners demanding exorbitant terms.

- (3) Minerals under copyhold or enfranchised land.
- (4) Minerals in small separate ownerships.
- (5) Legal disability of owners.
- (6) Cases of unknown owners.
- (7) Difficulties in working arising from surface support.
- (8) Coal unnecessarily left unworked as barriers.
- (9) Refusal of owners to grant wayleaves on reasonable terms.
- (10) Difficulty in obtaining surface powers for working or carrying minerals.
- (11) Restrictive conditions impeding development of minerals.
- (12) Onerous conditions of leases.
- (13) Absence of power to regulate the lay-out of a mineral field.
- (14) Loss of minerals in working.

62. In certain cases boundaries are arbitrary and irregular and make some coal difficult to work or not worth working.

63. We have carefully considered the evidence submitted to us and have come to the conclusion that the most effective method of dealing with the problem in the national interest would be for the State to acquire the ownership of the coal.

64. Under State ownership there would be one owner instead of several thousand owners, and the difficulties caused under the present system will be effectively dealt with.

65. For this purpose it will be desirable to set up a controlling authority to deal with such of these difficulties as the mere change of ownership will not affect.

For example:—

- (a) coal held by one lessee could not be worked by an adjoining lessee without the consent of the first lessee;
- (b) if a barrier is comprised in a lease it cannot be worked;
- (c) a change of ownership cannot place the State in any better position with respect to support for the surface than that of a private owner;
- (d) some authority must settle the question of any future pits, railways, or other surface work and surface way-leaves in the fixing of which the owner of the surface ought to have a voice.

66. It must be a condition of any vesting of coal in the State that the existing owners of royalties shall receive fair and just compensation and that the owners and occupiers of the surface shall be protected by suitable conditions and restrictions imposed upon the State.

67. The coal should only vest in the State subject to the existing leases or tenancies and in any case where an existing lease or tenancy is held for a term of years of which less than sixty are unexpired, the lessees or tenants must have the option of requiring the term to be extended upon reasonable conditions as to rent and otherwise up to the full term of sixty years.

68. As regards those cases where the coal is being worked by the owner as colliery owner it should only vest in the State subject to the granting to him of a lease for such a number of years not exceeding sixty years, as he may require upon such conditions as to rent or otherwise as may be customary in the district, fair and just compensation being paid to him.

69. There must be conferred on the State all usual or necessary mining easements over surface, together with power to procure all such easements in the future, subject to proper provision for payment of compensation for land occupied and generally for all damage caused to the owner or occupier of the surface.

70. The powers and provisions herein referred to would require to be carefully defined, and it is only necessary in this Report to indicate generally their character.

71. Provision will require to be made for dealing in the absence of agreement with questions arising between the State and the colliery proprietors as to the terms of either existing or future leases and to avoid preferential treatment.

Underground Wayleaves.

72. We have given some consideration to this subject and have met with much difficulty. The time at our disposal has been too short to enable us to investigate and come to a detailed conclusion on what we recognise is a complex problem.

73. Underground wayleaves may be divided broadly into two categories: (1) wayleaves through an area which is not at the time being worked, and (2) wayleaves through an area which is at the time being worked.

74. It has to be kept in view that according to our recommendations the State is to purchase only the seams of coal.

75. An area which is not at the time being worked may have been exhausted so far as the known seams of coal are concerned. On the other hand, in the area, certain seams only may have been exhausted. In either of these cases the wayleave might be through an exhausted seam. In the case of an area which is being worked, the wayleave may be in respect of conveyance of coal through a seam, a portion of which is at the time being worked, or it may be in respect of conveyance through a seam which has been completely exhausted.

76. As already explained, the State will acquire the seams of coal. There is no coal for the State to acquire in an exhausted seam.

77. The State as owner of the workable coal must have the right of access to the coal and the right of bringing the coal to the surface through any area.

78. On principle we consider that private rights, of whatever description, if acquired by the State, should be the subject of compensation to the owner of these rights, and we recommend that the question of underground wayleaves should be the subject of careful investigation.

Other Minerals.

79. This Report refers merely to the acquisition of the coal. We are, however, not ignoring the question of other minerals got by underground mining, whether worked in conjunction with coal or not.

The extension of the principle of acquisition in such cases may require consideration.

Purchase of Coal.

80. The State should pay fair and just compensation.

81. In this respect there is, in our judgment, no ground for regarding the owners of mining royalties differently from the owners of any other form of property recognised by the State.

82. We are of the opinion that the general basis of such compensation should be 15 years' purchase of the amount received by the owners for coal rents and royalties on the average of the last five pre-war years, less Mineral Rights Duty; the valuation being subject to such variation as the Assessing Tribunal may think fit, having regard to the present condition and future prospects of the area which forms the subject of the particular assessment. Each case must be dealt with on its merits.

Where the area was not worked or fully developed prior to the war, the compensation should be ascertained on the present condition and future prospects of the area.

Subject to the foregoing provisions, the valuation should be made in accordance with the recognised rules in such cases.

83. A Tribunal should be established in each district for the purpose of assessing the amount payable to each royalty owner in that district. The Tribunal should consist of a mining engineer appointed on behalf of the State, a mining engineer on behalf of the owners, and a legal chairman appointed by the Lord Chancellor in England or the Lord President of the Court of Session in Scotland.

84. These Tribunals should have power to obtain any necessary information by oral or written evidence and by personal inspection, and the number of expert witnesses who would be employed on behalf of the owner and the State respectively should be limited. Parties should be entitled to appear by counsel or solicitor and a lessee should also be entitled to appear similarly in the event of any question arising affecting his interest. The decision of the Tribunal should be final and should not be subject to appeal except on a question of law.

85. The risk of excessive claims or expenses should be guarded against by providing that where the amount awarded by the Tribunal does not exceed the sum, if any previously offered in writing on behalf of the State, the costs incurred by the claimant after the date of such offer shall be borne by the claimant. Subject to this proviso the State shall pay the costs and the expenses of and incidental to the assessment of the compensation and in all cases the costs and expenses in connection with the transfer.

Conclusion.

86. Having concluded our labours, we desire to express our high appreciation of the services rendered to us by Mr. Arnold D. McNair, C.B.E., Secretary of the Commission, and Mr. Gilbert Stone, Assistant Secretary, and also by the Staff of the Commission.

Their able and courteous assistance has been of the greatest value.

All of which we humbly report for Your Majesty's gracious consideration.

ARTHUR BALFOUR.
R. W. COOPER.
ADAM NIMMO.
ALLAN M. SMITH.
EVAN WILLIAMS.

20th June, 1919.

Memorandum by Sir Adam Nimmo, K.B.E., and Sir Allan M. Smith, K.B.E.

With reference to the foregoing Report:—

1. As the first stage of the enquiry was concluded and the three Interim Reports of 20th March, 1919, were issued before we became members of the Commission, we are not responsible for anything that was done up to that date or for anything contained in any of the Interim Reports. It is necessary for us to point this out, because in our opinion it is regrettable that the Chairman's Report was not confined to the two matters on which an Interim Report was promised by 20th March, 1919, by the Prime Minister, viz., "the two issues of wages and hours." It was on these two points only that the witnesses were invited to give evidence at that stage of the

proceedings. This is clearly indicated in the letter of 27th February, 1919, from the Secretary of the Commission to the Coal Owners' Associations, which stated that the first part of the enquiry would be confined to a preliminary investigation into the question of wages and hours.

2. The recommendation in favour of nationalisation or unification by purchase and/or by joint control in the Chairman's Report of 20th March, 1919, to which we refer, has made the consideration of these problems in the second stage of the enquiry more difficult for us than would otherwise have been the case.

ADAM NIMMO.
ALLAN M. SMITH.

20th June, 1919.

(4) Report by Sir Arthur Duckham, K.C.B., M.I.C.E.

Dated 20th June, 1919.

TO THE KING'S MOST EXCELLENT MAJESTY.

MAY IT PLEASE YOUR MAJESTY,

I HAVE the honour to present my Report in pursuance of the Coal Industry Commission Act, 1919, on the subjects which fell to be considered during the second stage of the enquiry.

I find myself unfortunately in disagreement with the rest of my colleagues on points both of principle and detail. It appeared to me therefore necessary to submit a separate report.

I divide my report into two parts:—

- (i) The opinions upon which my recommendations are based.
- (ii) My recommendations.

PART I.

Having listened to the whole of the evidence given before the Commission and having assimilated, so far as time has permitted, the many important and interesting documents that have been circulated to the members, I have formed the following opinions:—

I.

Ownership of Minerals.

The private ownership of minerals has not been and is not in the best interests of the community.

II.

Proving of Minerals.

The proving of the country's mineral resources should not be left to private enterprise.

III.

Disadvantages of Private Ownership.

The working of over 3,000 collieries by more than 1,500 separate interests has resulted in heavy losses of coal and inefficient working, and unnecessary difficulties in the winning of the coal.

IV.

Distribution.

The system of distribution of coal to small users and householders has not been and is not satisfactory. The system of distribution of coal to large users and for export in vogue before the war safeguarded the large consumer and encouraged the export trade.

During the war the control of coal supplies has undoubtedly:

- (a) Kept the price of coal within limits.
- (b) Ensured as far as possible an even distribution of the quantity of coal available.

On the other hand control has:

- (c) Resulted in grave inefficiencies in the use of coal, owing to the kind of coal delivered to the user being in many cases unsuitable for his purposes.
- (d) Caused unnatural conditions in the coal trade.

(e) Been responsible for many errors which naturally occur when an enterprise of such magnitude is ruled by a central and more or less makeshift organisation.

V.

Decrease in Output.

There is at the present time a serious decrease in the output of coal. This is caused partly by the general state of disturbance in industry, owing to the change over from war to peace conditions, and partly by a general slackening of effort on the part of all workers. Higher remuneration to labour has not resulted in larger output.

VI.

State Enterprise.

It has not been shown that there is an increased output per worker or less industrial strife when undertakings are owned and controlled by the State for the benefit of the Community.

VII.

Aspirations of Labour.

The workers desire and should have full opportunity to improve their status by :

- (a) Co-operating in the general conduct of the industry.
- (b) Obtaining a proper and sufficient return for their work.
- (c) The improvement of their general conditions of living.
- (d) Having sufficient leisure to devote time to their family circle and their own betterment.

VIII.

Cost of Coal.

It is essential, in order to safeguard the trade and industry of this country, to increase output and reduce costs by practising every economy and improvement in methods.

IX.

Need for Cheap Coal.

Cheap coal is vital to the industrial prosperity of this country and to the comfort of its citizens.

X.

Multiple Shifts.

The evidence has shown that only in a few areas is a multiple shift system of getting coal in operation. The multiple shift ensures the working of the coal face for the maximum number of hours per day by relays of workers. In the majority of collieries therefore the best results are not obtained. The objections of the workers form the chief difficulty in putting this desirable system into practice in all suitable places.

XI.

Housing.

The general housing conditions of the workers throughout the country leave much to be desired, but it has not been shown that miners are worse housed than other great classes of the industrial population. In many cases miners are badly housed. Some owners have consistently and successfully endeavoured to improve conditions. But for the war, many more suitable houses would have been built.

XII.

Pithead Baths.

Mining is a dirty occupation, and the condition of the miners' houses has been made worse and the lives of the miners' wives and families made harder by the dirt being carried into the houses. Pithead baths and drying rooms for pit clothes should have been the rule long ago. Both owners and men have been at fault.

XIII.

Health.

It has not been shown that the health of miners or their families is worse than the health of the workers in other industries.

XIV.

Safety.

The standard of safety in British mines compares most favourably with that in mines in other countries. It has not been shown that nationalisation in other countries has improved safety conditions.

XV.

Private Enterprise.

The development of the coal industry (the chief source of the wealth and industrial success of this country) has been entirely due to private enterprise. On the other hand grave losses to the community have been caused by lack of co-ordination in the efforts of private enterprise.

XVI.

Friction between Owners and Workpeople.

In some of the districts there has been a failure on the part of the owners and workers to realise that their interests should be made common. The result has been continual and gradually increasing friction and mistrust, which have caused decreased efficiency in the working of the mines. The refusal of the Miners' Federation to co-operate with other unions of workers, with the employers, and with the State to obtain general industrial agreement is much to be regretted.

XVII.

Poor Collieries and Areas.

The prosperity of collieries and coal areas varies greatly. There is grave danger under present conditions of many collieries and even some areas going out of production.

XVIII.

Nationalisation.

National ownership and control of collieries does not offer a real solution of the problems. Many advantages have been claimed for nationalisation: practically none has been sustained. Many cogent objections have been advanced against nationalisation, the majority of which have not been refuted. The nationalisation of the coal mining industry would be an unprecedented and colossal experiment. A mistake would result in a national calamity.

XIX.

Bureaucratic Control.

There is a general agreement that bureaucratic control would be unsuited to the proper conduct of the coal industry. Incentive and freedom of action are necessary; bureaucracy stifles both.

XX.

Miners' Federation Bill.

The Bill drafted and submitted on behalf of the Miners' Federation does not offer a satisfactory solution. Among many points which make this scheme unworkable are the following:—

1. The Minister is responsible both to Parliament and a Mining Council.
2. The impracticable proposals for the control of the industry.
3. The predominance of the Miners' Federation; the disregard of the many other interests concerned in the industry.
4. The proposed confiscation of property.
5. The very wide powers of acquisition to be granted to the Mining Council, coupled with a disclaimer clause which might paralyse industry.

XXI.

Mineowners' Proposals.

The mineowners' proposals show a desire to meet the aspirations of the workers, but a profit-sharing scheme, under which bonuses form part of the wages, and the failure to include workmen's representatives on the Board of Directors as a necessary adjunct to the scheme render the main proposals unacceptable. Further, there are no suggestions for the unification of the working of collieries in the same district.

XXII.

Research.

Research and experiment to improve methods and conditions of working and dealing with coal have not, in the majority of collieries, received sufficient attention. No evidence is forthcoming, except in a few specific instances, of serious co-operative effort between owners to carry out research and to pool ideas and experience.

XXIII.

Fuel Conservation.

An enormous amount of fuel is being wasted in this country. The collieries are offenders, but every industry is wasting fuel by using it uneconomically. A very substantial saving could rapidly be made if the question of economy were made a national one. The generation of electricity in central stations is only one line of advance. Similar and even greater savings could be made if proper action were taken in other spheres.

XXIV.

Unsettled Position of Industry.

Control and special war conditions have disturbed the whole industry. The appointment of the Coal Commission, the issue of the interim reports, and the publication of evidence in the Press have unsettled the industry still further, and are preventing all development. It is essential that the future of the industry be decided at an early date. Conditions in the industry should be changed as little as possible, compatible with the attainment of efficiency, better conditions and satisfactory supplies to the consumers.

PART II.

Having briefly stated my opinions as to what are the salient facts of the present situation, I make the following recommendations. The time left for the preparation of reports after the completion of evidence has been so short that it is only possible to make recommendations on the broadest lines.

XXV.

Acquisition of Mineral Rights.

The whole of the mineral rights of Great Britain should be acquired by the State, the value of such rights being estimated in each case on the same basis as adopted by the Inland Revenue in assessing ownership of minerals for death duties (the evidence of the witnesses from the Inland Revenue Department clearly show the principles), due regard being given to the change in value of money owing to the war, increased taxation (with the exception of the Excess Mineral Rights Duty), etc. No increased value should be given in cases where it can be shown that mineral owners have used improper pressure to obtain royalties above those commonly obtained or in the case of sliding scale royalties which have become excessive through war conditions. Compensation should preferably be paid in the form of annuities, as suggested in Mr. Walter Leaf's evidence.

XXVI.

Ministry of Mines.

A Ministry of Mines should be set up, which should, at a later date, form one of a group of Ministries attached to a Ministry of Industry. The duties of the Ministry of Mines should be (*inter alia*)—

- (a) To supervise and control all mineral rights throughout Great Britain and to ensure the proper working of all minerals.
- (b) To ensure the making of a complete geological survey (including the systematic proving of all coal areas) of the whole country.
- (c) To be responsible, through its inspectors, for the proper equipment and running of mines to ensure safety.
- (d) To initiate and, if necessary, carry out research for the improvement in the conditions of those working in and about mines, better methods of winning coal, etc.
- (e) To undertake the study of the special diseases of underground workers and to initiate special treatment.
- (f) To exercise any control of the industry which a national emergency may render necessary.
- (g) To advise the Minister of Labour as to the special conditions in the coal industry.
- (h) To co-operate with any Government Department set up for the conservation of fuel.

XXVII.

Area Commission.

A Commission assisted by experts acquainted with the various districts should at once be set up to decide the areas into which the country should be divided (all mining interests in each of such areas being amalgamated) in order to obtain the best economies and efficiencies in the winning and working of coal. The areas should not be larger than necessary to ensure—

- (a) The most efficient draining and pumping for the whole area.
- (b) The most rapid transport of the coal to the surface and the miner to his work.
- (c) The obtaining and distribution of power from one centre.
- (d) The prevention of waste of coal by artificial barriers, etc.
- (e) The proper handling of the various classes of coal produced in the area.

XXVIII.

Unification.

It is essential that all the colliery interests in the areas specified should be amalgamated in order to obtain proper working. The amalgamated interests would be granted a lease by the Crown to work coal and other necessary minerals.

XXIX.

Method of Unification.

It is possible to prepare a variety of schemes to attain the primary object of unification in areas, but the following proposals are made to illustrate the intention. The proposals assume the discontinuance of the present system of control.

The whole of the mining and mineral interests in each area should be amalgamated into a Statutory Company (hereinafter called "a District Coal Board").

- (a) The total par value of the shares issued by any Board shall not be greater than the total value of the various amalgamated interests as going concerns at the present time, but valued at 1914 prices, due allowance being made for the capital expenditure since that date at enhanced prices.
- (b) The shares of the District Coal Board should be of one class only and should be entitled to a minimum rate of dividend of 4 per cent. which should be guaranteed by the Government.
- (c) Profits in excess of those necessary to pay the 4 per cent. dividend and usual depreciation may be utilised—
 - (i) to form such reserve funds as may be approved by the Minister of Mines.
 - (ii) To pay a further 2 per cent. dividend.
 Of the remaining profits one-third may be utilised for paying further dividend on shares, but the other two-thirds must be used to reduce the price of coal.

The above proposals for the division of profits do not preclude a bonus on profits being paid to the managerial and clerical staff. This would correspond to the bonus in output proposed below for the manual workers.

XXX.

Government Right to take over a District Coal Board.

The Government shall have the right to take over the shares of any District Board should the Board have called upon the Government in four years out of a consecutive seven years to make advances to pay the guaranteed dividend and the Board failed to repay within the seven years any advances made. The compensation to be paid by the Government for the shares so acquired should be based upon the profits earned by the undertaking during such seven years.

XXXI.

Board of Directors.

The number of Directors on each Board should be not less than seven. All except three of the Directors should be appointed in the ordinary way by the shareholders. Of such three Directors, one should be elected by ballot of the agents, managers and under-managers, and two by ballot of the workpeople engaged in the area.

XXXII.

Government Representative.

The Government, as owner of all minerals in the area, should appoint a competent mining engineer to safeguard the interests of the State. He should have the right to attend directors' meetings when he desires to do so, but should have no voting power.

XXXIII.

Agents, Managers, and Undermanagers' Representatives.

The agents, managers and undermanagers have and will continue to have legal obligation for the proper and safe running of mines. They therefore should be represented on the Board of Directors. Their expert advice would be invaluable.

XXXIV.

Workmen's Representatives.

Labour has a special claim for representation on the directorate as wages form the predominant item in the cost of production and the conditions of the industry are necessarily hazardous. The other directors would benefit greatly by having actual workers on the Board with a close knowledge of conditions, and the workmen would have a definite voice in the conduct of the industry.

XXXV.

Each director must have full power of taking decisions and voting without reference.

XXXVI.

Minimum or Standard Wages.

The minimum or standard wages for mine workers should be considered and settled together with the general wages of the country. Whatever machinery may be set up by the Minister of Labour for this purpose should be utilised.

XXXVII.

Committee for Settling Rates and Wages.

Special rates and wages should be settled for the area of each District Board. The basis should be the agreements at present in force which have been arrived at after years of experience. Conciliation Boards on similar lines to those now existing shall deal with special wages and disputes.

XXXVIII.

Payment by Results.

The wages of all workpeople and employees should be guaranteed by minimum or standard rates. An equitable system of payment on increased output and efficiency should be arranged and made applicable, as far as possible, to all manual workers in addition to the system of piece-work rates at present in force.

XXXIX.

Associated Undertakings.

Where a colliery undertaking is attached to other industrial undertakings, such as iron, steel-works, by-product ovens, &c., the value of the colliery undertaking should be separated and included in the holding of the District Coal Board. The colliery should then be leased back to the original owners, who would have the right to raise and use all coal necessary for their own purposes, but they should have no powers to sell coal as such except through the District Coal Board.

XL.

Responsibility of Manager.

At each colliery, as now, the manager should be responsible for and have complete control of the running of the pit. The District Coal Board will have managing directors, consulting engineers and technical experts, who will naturally discuss matters with the managers and lay down general policy.

XLI.

Pit Committees.

At each colliery a pit committee should be set up with the manager as chairman and representatives of each main class of workmen employed in or about the mine. The pit committees should meet at definite intervals and would be competent to discuss and make proposals on—

- (a) safety of the mine;
- (b) conditions of working;
- (c) improvement in methods;
- (d) comfort and well-being of the workers while in the mine or colliery premises;
- (e) any disputes that may arise other than wages disputes.

Wages would not be discussed at pit committee meetings.

XLII.

Multiple Shifts.

The general extension of multiple shifts, as the most ready means of increasing output, reducing costs, and improving wages to the workpeople as a whole, should be immediately considered by a joint committee of the Government, owners and miners.

XLIII.

Housing.

Housing is a national question. The present great Government scheme will prevent any other general scheme forward, as all available building facilities will be fully utilised.

XLIV.

Pit Head Baths.

The 1*d.* per ton levy proposed in the Interim Report presented by the Chairman, myself and my two colleagues should be immediately used for setting up pit-head baths and drying rooms. This will do much to improve housing conditions.

XLV.

Distribution.

Municipalities and local authorities should be given powers to undertake the distribution of coal in their areas, either by setting up their own organisations, purchasing existing businesses or employing existing contractors.

XLVI.

Coal Traffic.

The question of the economy of coal traffic and private ownership of wagons should be dealt with by the Minister of Ways and Communications in conjunction with the Minister of Mines. The interests of the consumer must be safeguarded, and the consumer must be given free choice of fuel to ensure proper economy in its utilisation.

XLVII.

Accounts and Costing.

A standard form of accounts should be adopted for all District Boards.

XLVIII.

Publicity.

It is essential that there should be complete publicity as to the operations and financial results of the coal industry. The Ministry of Mines should be expressly charged with the duty of publishing, not less than once a year, figures showing the cost of getting coal in each of the districts of the country, and the proportion chargeable to materials, wages, general expenses, interest, profits and other general items.

XLIX.

Meeting of Chairmen of District Boards.

The Minister of Mines should hold a meeting of the Chairmen of all District Boards quarterly (and at such other times as may be required by the Minister).

L.

Commission for Heat, Light and Power.

Commissioners for Heat, Light and Power should be appointed, who should undertake a full enquiry into the wastage of fuel and the best methods of effecting economies throughout the country.

I desire to associate myself with the Chairman in his expression of thanks and appreciation to the Assessors and Secretaries for the invaluable help they have given to the Commission throughout the enquiry, and for the great assistance I have received from them in the preparation of my Report.

All of which I humbly report for Your Majesty's gracious consideration.

ARTHUR DUCKHAM.

20th June, 1919.

LIST OF WITNESSES.

THE FOLLOWING IS A LIST OF THE WITNESSES WHO HAVE GIVEN EVIDENCE BEFORE THE COMMISSION UPON THIS STAGE OF THE ENQUIRY:—

Name.	Description.	Principal Topic.	Questions.	Pages.
Andrews, Arthur ...	President, Swansea Chamber of Commerce.	Anthracite and Steam Coal Trade in South Wales.	24,010-24,047	994-997
Andrews, Mrs. Elizabeth.	Wife of ex-miner (South Wales) ...	Hygienic conditions of miners' homes.	24,393-24,462	1019-1022
Ashley, Sir William James.	Vice-Principal and Professor of Commerce, University of Birmingham.	Economics	10,561-10,579	427-430
Bailey, Thomas Henry.	Mining Engineer	Mining leases and Mineral Royalties.	16,916-17,113	689-697
Beauchamp, Sir Frank, Bart.	Colliery Owner	For Bristol and Somerset and Forest of Dean Coalfields.	21,371-21,503	890-898
Bell, Sir Hugh, Bart.	Managing Director of Bell Bros., Middlesbro', &c.; representing National Federation of Iron and Steel Manufacturers.	Effect of Nationalisation of Mines on other industries. Consumers.	26,221-26,383	1121-1132
Birtles, Henry ...	Registrar of Joint Stock Companies, Somerset House.	No. of Shareholders in Coal-mining companies &c.	27,956-27,979	1203-1205
Blane, William, C.B.E.	Mining Engineer	Subjects subsidiary to principles of Nationalisation.	22,741-22,852	950-954
Bowden, John Horace.	Chief Engineer and General Manager, Poplar Electricity Department, Secretary, Trades Union Congress ...	Public Control of Electricity Works. Consumers	25,958-25,989	1106-1108

COAL INDUSTRY COMMISSION.

SECOND STAGE—FIRST DAY.

WEDNESDAY, 23RD APRIL, 1919.

PRESENT :

THE HONOURABLE MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. ROBERT SMILLIE.

MR. R. W. COOPER.

SIR ALLAN M. SMITH

SIR ARTHUR DUCKHAM.

MR. HERBERT SMITH.

MR. J. T. FORGIE.

MR. R. H. TAWNEY.

MR. FRANK HODGES.

MR. SIDNEY WEBB.

SIR LEO CHIOZZA MONEY.

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE (*Assessor*).

MR. ARNOLD D. McNAIR (*Secretary*).

MR. GILBERT STONE (*Assistant Secretary*).

Chairman: Gentlemen, in order that the Press and the general public may appreciate the class of evidence we are going to call, I will state quite shortly the nature of the evidence to be given at the first part of the Inquiry. We have, first of all, thought it wise to call a number of gentlemen who are scientific economists; that is to say, gentlemen who have not practical experience with coal mines, but who are text-books writers, professors, and other learned persons who treat upon the subject of Nationalisation generally. For example, we shall have to-day Professor Pigou, who is Professor of Political Economy in the University of Cambridge, and a Fellow of King's College, Cambridge. Then we shall have Professor Sir William Ashley, who is the Vice-Principal of the University of Birmingham, and Professor of Commerce at the same University. We shall have Professor Edwin Cannan, Professor of Political Economy in the University of London and the London School of Economics and who is the author of various works on economic subjects. There is a number of other gentlemen of the same class. We hope, for example, to call first to-morrow a very well-known gentleman, Mr. Harold Cox, who is a writer upon these subjects. We also have a Professor from the University of Glasgow, Professor W. R. Scott, and other learned gentlemen from other Universities, and eventually one member of our own body, Mr. Sidney Webb, will give us his views; he will go into the witness box, offer himself for cross-examination, and give his views not only generally upon the subject of Nationalisation, but especially on the Nationalisation of the particular industry with which we are now dealing. I had hoped that the whole of those witnesses, except Mr. Sidney Webb, who is not able to be here to-morrow or the day after, would be finished by to-morrow night; but, unfortunately, owing to somewhat short notice, the Commission was not able to have the private meeting which we hoped to have last night. Some of the members did not attend, and the result is that the Commission will have to adjourn to-day at half-past one, and not sit again to-day. It will deliberate in private to-morrow morning, and will sit punctually at two o'clock to-morrow afternoon. I hope, with the two sittings of this morning and to-morrow afternoon, that the whole of what I call the scientific witnesses will be finished, with the exception

of Mr. Sidney Webb, and any other gentleman who may come possibly later, but of whom at present I am not aware.

After that evidence is concluded we propose to consider the case of the royalty-owners, and, giving the best estimate I can with regard to time, I hope and think they will be called first thing on Friday. The Commission will not sit on Saturday, but will resume its sittings on Tuesday. After those witnesses have been finished we shall call other classes of witnesses, and I will announce those classes of witnesses, and as far as possible their names, at the Tuesday sitting. The first two sets of witnesses, as I say, will be the scientific economists and the royalty-owners.

I now propose to call the first witness of the scientific economists, namely Professor Pigou.

Mr. R. F. Pawsey: Sir, may I make an application?

Chairman: Yes.

Mr. R. F. Pawsey: I desire to make a formal application to the Commission under sub-section 3 of section 2 of the Act constituting the Commission that royalty-owners may jointly appear by counsel and witnesses.

Chairman: That sub-section reads: "Persons interested in the inquiry shall not be entitled to appear before the Commissioners by counsel or solicitor unless it appears desirable to the Commissioners to allow any such appearance for special reasons." What special reasons do you allege?

Mr. R. F. Pawsey: My special reasons are that there is no one on the Commission directly representing the interests of royalty-owners, and it is very desirable that those interests, which are both small and great, should be put before the Commission. Further, Sir, I say that, having had experience as a witness in the chair, I desire that Counsel shall not only advise witnesses, but be here to protect witnesses.

Chairman: I am not for a moment saying I am unsympathetic with your application, but could you kindly deal with the question of it being a special reason? Was there anybody representing the royalty-owners upon the Mining Royalty Commission?

Mr. R. F. Pawsey: Yes.

23 April, 1919.]

[Continued.]

Chairman: Who was it, please?

Mr. R. F. Pawsey: It appears at page 80. Mr. Frederick Parker Rhodes was undoubtedly a solicitor who has a very wide experience indeed in royalty matters.

Chairman: Take Mr. R. W. Cooper on this Commission. Has he not experience of royalty matters? He is one of the Commissioners.

Mr. R. F. Pawsey: But I think Mr. Rhodes directly represented royalties.

Chairman: I see your point.

Mr. R. W. Cooper: As a matter of fact, the late Mr. G. B. Foster was a direct representative of royalty-owners, and so was Mr. Jamieson, of Edinburgh.

Chairman: Your point, Mr. Pawsey, first of all, is that there is precedent for it on another Commission, and the special reason is that you are not represented on this Commission. Were there Counsel before that other Royal Commission? Perhaps you would like to renew your application when Mr. Leslie Scott is here?

Mr. R. F. Pawsey: I would.

Mr. Robert Smillie: Would Mr. Pawsey put in a list of the people he directly represents and applies for?

Chairman: I understand this gentleman's position, and I daresay he is instructing Counsel.

Mr. R. F. Pawsey: Yes. Might Mr. Leslie Scott make the application to you?

Chairman: Certainly. When can he make it?

Mr. R. F. Pawsey: I hope before half-past one.

Chairman: If he does not, will you renew your application?

Mr. R. F. Pawsey: Yes.

Mr. Robert Smillie: When Mr. Leslie Scott makes the application later on will you put in a list of the Members of your Association?

Mr. R. F. Pawsey: The point would be that we should represent the royalty-owners of Scotland, Northumberland, Durham, Lancashire, South Wales, Yorkshire and the Midlands.

Chairman: All the royalty-owners?

Mr. R. F. Pawsey: I cannot say all the royalty-owners are bearing this expense. They are collectively

now, not in the former Association I represented, represented by this Committee of the joint royalty-owners of the Kingdom.

Chairman: When Mr. Leslie Scott renews the application you might ask him to give your precedents and reasons. I am sure there are some if you say there are.

Sir L. Chiozza Money: Could we know what amount of royalty capital is represented by this gentleman?

Chairman: Mr. Leslie Scott will tell us when he makes the application.

Mr. R. F. Pawsey: Now, may I ask for leave to purchase copies of the evidence upon which the Reports have been issued?

Chairman: Do you want leave for that? Can you not get it from the stationer?

Mr. R. F. Pawsey: We cannot get it. We have daily applied since the Commission adjourned and we cannot get it. There is no means of our witnesses studying Sir Richard Redmayne's evidence.

Chairman: That is a perfectly reasonable application. The position at present is that the evidence has to be revised and corrected by the gentlemen who gave it. One gentleman, I understand, is somewhat astonished at the evidence he gave and wants rather large revision. Yours is a perfectly reasonable application, and the reason it cannot be acceded to is not that we are not ready to do so, but the revised edition is not to hand.

Mr. R. F. Pawsey: Might we postpone calling evidence until we get the printed proceedings?

Chairman: I do not know when you will get the evidence. If it will assist you, my view about it is that this is a National inquiry and we want everyone's brains so as to come to a good solution of the question. I do not care whose brains they are. I will give you my own copy of the evidence, but this morning I cannot do more than that.

Mr. R. F. Pawsey: I would not rob you, Sir. I have one copy, but that copy is in the hands of leading Counsel.

Chairman: If you have mine then you will have two copies. I am afraid at the moment it is at my private house, but I will send for it and you shall have it, but you will let me have it back?

Mr. R. F. Pawsey: Certainly.

Professor ARTHUR CECIL PIGOU, Affirmed and Examined.

Chairman: The system we have is that I read your proof, and after that any gentleman on the Commission who desires to ask you a question will do so. This is your proof:

Arthur Cecil Pigou, Professor of Political Economy in the University of Cambridge and Fellow of King's College, Cambridge, will say:—

1. I have never made any special study of the problem of nationalising coal mines. It has obviously been impossible for me to do this in the few days since the Secretary invited me to give evidence. Nevertheless, I am, of course, at the service of the Commission, and if, in the circumstances, they wish to hear me, am willing to attend.

2. Nationalisation in any sense cannot be judged on grounds of general principle. What would work well under one kind of Government would work badly under another; and what, under any given Government would work well for one industry would work badly for another. The desirability or otherwise of the nationalisation in any sense of any industry can only be determined after a detailed study of the characteristics of the industry in relation to the qualities of the country's Governmental machinery.

3. What is desirable in respect of one industry depends in part on what is being done in other industries. Thus if railways and electric power are nationalised, from one point of view the case for nationalising coal mines is strengthened. But from

another point of view it is weakened, because of the danger of overweighting the Governmental machinery. It does not follow, for example, that because, say, the Government is fitted to run the Post Office, it is therefore fitted to run 200 other industries of the same general type.

4. When an existing method of running an industry is up for trial as against a proposed new method, there is a tendency to exaggerate the advantages of change, because the defects of the existing method are demonstrable and those of the proposed method are not. The existing method in practice comes to be contrasted with the proposed method in ideal. But the proposed method, whatever it is, when applied, is certain also to involve a great deal of friction and waste. Evidence of inefficiency in the present system is, of course, *pro tanto* an argument for change, but it is not a decisive argument.

5. To the present system of working the coal industry the principal alternatives appear to be the following: (1) unification under a private combine subject to Government control in the matter of prices and conditions of work; (2) the transference by purchase of the mines to a special "public utility" authority on the pattern of the Port of London Authority; (3) the continuance of the mines in private ownership but the permanent establishment over them of Government control empowered to issue orders not merely about prices and conditions of work but also about organization and methods of production; (4)

23 April, 1919.]

PROFESSOR ARTHUR CECIL FIGOU.

[Continued.]

the purchase of the mines by Government and their leasing to private concerns covering suitable areas, subject to various conditions as to co-operative working and prices: (5) the purchase by Government of a "controlling interest" in all mines and the appointment of Government representatives on the Boards of Directors: (6) Government ownership *plus* Government management through a Minister of Mines.

6. *Plan 1.*—Unification in a private combine under the auspices of the State would involve the creation of a dangerously powerful monopoly; and no promise of safeguards would bring people to tolerate it. This is not practical politics.

7. *Plan 2.*—Under the Port of London Authority scheme it is provided that if the Authority fails to obtain sufficient income to meet the interest on its stock (with which the Company was bought out) its charges shall be raised until it does obtain sufficient. This arrangement provides a safeguard against the danger that under direct Government management political pressure should cause the concern to be carried on at a loss, or, in other words, with the help of a bounty from the taxpayers. It should not, however, be impossible to provide against this danger under nationalisation proper. Apart from this, the Port of London Authority plan seems to have no advantage over the other *for an industry of national scope*; and it is very improbable the Parliament would agree to set up an *imperium in imperio* of this kind.

8. *Plan 3.*—The continuance of mines in private ownership working under a Government authority empowered to issue orders is preferred by some to full nationalisation on the ground that under it the advantage of private initiative and enterprise would be retained. It must be noticed, however, that under this scheme, the control contemplated does not merely refer to prices as in various plans that have been proposed for controlling "Trusts." One of its chief purposes is to improve efficiency by regulating organisation and productive methods. It seems to me that this plan as a permanent arrangement—it is different if all parties regard it as a temporary war measure—is open to very great objection. It seems probable that the existence of so large a measure of control would really sap private initiative, while the existence of so much private power would prevent the full benefits of unification from being reaped. Private initiative has good points and unified Government management has good points. This plan, by trying to compromise, might fail to secure the advantages of either.

9. *Plan 4.*—Under the system of Government ownership, *plus* private working on conditional leases, it may be presumed that the conditions would be laid down once and for all in the terms of each lease, so that private initiative would not be obstructed as it would be on the preceding plan. If the conditions imposed were framed judiciously this plan would enable a good part of the economies expected from unification to be secured. The conditions might include provisos about joint Councils of management on the Whitley plan. Moreover, it would be open to the Government under this plan to lease certain mines as it were, to itself. It might in this way safeguard, for example, the supplies needed for the Admiralty. If it seemed to work satisfactorily the range of Government management might be from time to time extended. Meanwhile, what advantages there are in private initiative and enterprise would be retained. This is the policy of caution and safety. Its chief disadvantage is that, under a leasing system, when there was always a chance that the lease would not be renewed, arrangements for compensation for "Tenant's improvements" could hardly be perfect enough to prevent the tenants from adopting a policy of parsimony towards the end of a leasing period. It has also to be remembered that bids for these leases might not always be forthcoming; and that there might sometimes be a difficulty in collecting rents.

10. *Plan 5.*—It is of course cheaper for the Government to purchase a controlling interest in all the mines than to buy them all up completely, but, since

its policy of unification would be certain to alter the relative values of different mines, the shareholders who retained their shares, in some of them would get a windfall, and in others would suffer serious loss. Theoretically, a controlling interest all round would enable the Government to do everything that it could do after full purchase. But it would be very difficult to work the plan fairly; and the greater cheapness is no real advantage, for, though the Government has, in a sense, spent less, it has also got less.

11. *Plan 6.*—Under full nationalisation there are possibilities of results better than any other plan can offer. With complete control over the whole mining industry of the country, operating through officials and workmen who felt themselves servants of the State, a perfectly wise autocrat could do wonderful things. He could fit every mine exactly into its proper place, apply all improvements to all the mines immediately, and work each mine exactly to the most advantageous extent. All these and many other excellent things a perfectly wise autocrat could do. Whether an actual Minister of Mines, whose political complexion has always to be that of the Government of the day, would in fact do this, is a different question. It is common to charge against the present system that the methods and appliances ruling in the best mines are not also found in the worst, and it is urged that under nationalisation, this would no longer be so. I agree that the standard in different mines would be *more uniform*, but I am not clear that, taking a long view, it would be *higher*. Under private initiative many people are seen lagging behind because a few got ahead. Under nationalisation none would be seen lagging because none would be interested to get ahead. The best methods and appliances current anywhere would be applied everywhere, but there would be no inducement for individual pioneers to devise still better methods and appliances. In like manner promotion by merit and dethronement by bankruptcy might yield to promotion by rule. No doubt devices are available by which the dangers of stagnation could be lessened. A special section of the Ministry of Mines might be appointed to study the possibilities of improvement, both directly and in the light of the experience of other countries. Systems of "comparative cost accounting" of the kind adopted in a number of American Trusts might be made use of to stimulate the energies of the managers of various mines. And other plans of a like tendency might be adopted. As to what would happen an academic outsider is quite incompetent to judge. The best guess—and it would only be a guess—could be got from someone familiar with the mentality, both of large businesses and of Government Departments. But there is certainly a real danger that full nationalisation might universalise the good at the cost of preventing the emergence of the better.

12. The importance of this consideration, in a comparison between full nationalisation or the lease system—which seems to me to be the best of the other plans—depends in part on how far under that system competition between the separate lease-holding companies would really be maintained. If the whole industry was leased out to one single company there would be nothing in the argument. The more numerous the lease-holding companies are the more weight it would have; but, on the other hand, the less opportunity there would be for economies due to large scale operations.

13. The importance of the above consideration also depends in part on how far the Coal Industry is one in which the best methods and appliances in use now may reasonably be regarded as the best that are ever likely to be discovered. It might, perhaps, fairly be claimed that in the Post Office this condition of things is almost completely fulfilled. Plainly, if no improvements are possible in any event, the establishment of an organisation that tends to discourage the search for improvement can do no harm. I have no knowledge as to how the Coal Industry stands in this matter.

14. I should like to add that one general economic argument often urged in favour of nationalisation seems to me to be largely invalid. It is said

23 April, 1919.]

PROFESSOR ARTHUR CECIL PIGOU.

[Continued.]

that, owing to the superiority of Government credit, the State can raise at, say, 5 per cent. the money required to buy out a private concern paying 6 per cent. or 7 per cent., with the result that, if the concern is worked by the Government with the same efficiency as before, a real gain, which can be used either as profit or as a means for lessening prices, must result. The reason, however, why people ask 6 per cent. or 7 per cent. from a private venture, and only 5 per cent. from the Government-owned venture, is that, if the private venture fails, they will bear the loss and, if the other fails, the taxpayers will. Lenders to the Government are insured against risk by the taxpayer. Lenders to private concerns are not. If the same proportion of ventures turn out unprofitable under the two plans the real cost involved under them is substantially the same, and the better terms on which the State can borrow involves very little real saving.

15. If it is decided to nationalise the mines the question will arise as to what should be done about distributing their products. I am not competent to discuss the suggestion that the Government, through municipal authorities or otherwise, should take over the work of distributing coal within the country. I am, however, distinctly opposed to Government conduct of the export industry. It seems to me that this might lead to political difficulties, particularly when the purchasers were foreign Governments.

I am very much obliged to you for your testimony.

10,526. *Mr. Sidney Webb*: You say very definitely with regard to your Plan No. 1, that a private combine would involve the creation of a dangerously powerful monopoly, and that no promise of safeguards would bring people to tolerate it. That applies, I gather, in your mind to any plan of complete unification under private ownership?—Yes.

10,527. It has been suggested that such a combination might be controlled by schedules of prices and schedules of wages and maximum hours. Do you suggest that that amount of control would not be adequate?—I suggest that it is not practicable: people would not accept it.

10,528. I agree with you. Similarly the same argument applies to your "Public Utility" Authority Plan, does it not? Even with a Port of London Authority, it would be still in the position of a private monopolist?—Its profits would not go to private persons.

10,529. How would the coal consumer look upon it? The question is whether the consumer would be prepared to trust to a public utility authority the power of putting up prices to any extent?—I think the main objection would be that Parliament would not allow such a powerful body alongside itself dealing with a national concern.

10,520. Then you suggest that the other plan of mere control by orders has the drawback that it interferes with private enterprise and initiative?—Yes.

10,521. Do you think that you could arrange any plan by which you could secure the control adequately, and yet allow sufficient freedom to tempt private enterprise?—If the control was extended to methods of organisation, it would be very difficult, I think.

10,522. And if the control was not extended to methods of organisation you would then fail to get any improvements through economy?—Yes.

10,523. You indicate some approval of the system of conditional leases. Does not that rather depend upon how many separate enterprises there are?—Yes.

10,524. You indicate that later on—that unless you had a large number of separate leases and leasehold enterprises, you would not get competition and the results of emulation?—Yes.

10,525. But if you had a large number of separate leases, you would not get the profits of unification?—Yes.

10,266. Therefore we are in a dilemma. In order to get the advantages of unification you must forego the advantages of competition?—Yes.

10,267. I think that is clear. That brings you practically to nationalisation. You point out that a national department of mines might have a department of research and discovery into new inventions. Do you attach any importance to that? Do you think that could do very much?—I think it would be essential if the mines were nationalised. I think it would be of great importance.

10,268. You say it is essential if the mines were nationalised. Does not that rather indicate its absence is a loss now in the unnationalised system?—Yes.

10,269. Competition will do very much, but it hardly makes discoveries, does it?—The separate people have an opportunity for trying things. Of course, with regard to discoveries in a large sense perhaps that is not so.

10,270. You point out that there would be an advantage in having a system of "comparative cost accounting," which is very common in America. Would not that be of equal advantage at present with the separate ownership of mines?—Well, it is hardly practicable with separate ownership.

10,271. It is a drawback of separate ownership that you do not get this comparative cost accounting?—Yes, but you have a partial substitute in the competition of the mines.

10,272. In so far as that competition weeds out the bankrupt mine, that may be the case, but is it your experience that these mining concerns do go bankrupt?—I have no knowledge of mining concerns.

10,273. Is it not conceivable that a concern might be below par for a very long time and yet not go out of existence?—Certainly, but I did not mean competition between mines. If a manager in one mine does not seem to be working so well he is more or less set against the other mines.

10,274. But there is so little knowledge of the achievements of the different managers—Yes. The less the knowledge the less the force of the argument.

10,275. You suggest one of the advantages of nationalisation would be that we might expect a certain uniformity of excellence: that such things as had been discovered in one mine would be applied universally—that is an ideal—but there is the drawback that you might tend to prevent new inventions and improvements. That is the suggestion, is it not?—Yes.

10,276. At present what inducement is there? Of course, there is the inducement of pecuniary gain, but what inducement is there to make improvements now?—The manager, I suppose, has a certain liberty to try. It is like this: If you have a number of plants, they vary in different directions, and so you get the chance of a good variation which can be copied.

10,277. And it is not merely the chance, but it results from an attempt to get a good variation?—Yes.

10,278. What is the motive for that attempt?—I suppose there are several motives.

10,279. What is the motive we should lose under nationalisation?—My doubt about nationalisation is that the thing might be run so much by rule that it would check the initiative of the management.

10,280. But the point is about the motive to the managers, or rather not to the managers, but to the management?—Yes; I should have said "management."

10,281. The motive to the management at present is practically pecuniary profit or the expectation of getting more profit?—Yes.

10,282. I want you to carry your mind to some of the possible improvements which do not depend upon pecuniary profit. Take, for instance, the question of accidents. It has been said, as you know no doubt, that it costs less to pay for accidents than to prevent them. Assuming that to be true, the motive of

23 April, 1919.]

PROFESSOR ARTHUR CECIL FIGOU.

[Continued.]

pecuniary profit would not lead to the prevention of accidents, would it?—That depends upon the arrangement for compensation.

10,283. My question to you practically is, How do you think we can best get the greatest attempt at the prevention of accidents?—You mean as between nationalisation and private management?

10,284. Yes.—Of course it depends upon what the general law is under nationalisation.

10,285. Take another case which has been given in evidence, that miners as such have a very large infantile mortality in their families and, in fact, are very badly housed and generally live under less sanitary conditions than is desirable. How do you think we can best get that altered?—I should have thought that the housing question should be treated generally rather than with reference to a particular industry.

10,286. Of course, as you know, the question of the roads is treated generally. But whenever there is a case of extraordinary traffic it is not made a charge on the authority maintaining the roads, but is recovered from the industry causing the extraordinary traffic. Supposing in the case of the miners the housing was an extraordinary item of expense for various reasons, would it be quite fair to charge it on the local ratepayers?—I do not mean it should be charged on the local ratepayers, but there should be a general law about the minimum conditions of housing.

10,287. You would merely have with regard to housing a general law which prescribed the minimum?—Yes, I think so.

10,288. Has that not proved to be a little inadequate? Then there is a very interesting point here which you make as to the difference between the interest which the Government pays on its loans and the interest which people expect from private concerns. You say there is not really a saving of expense because in so far as the risk is the same there is the same deduction by whomsoever it is borne?—Of course the risk is not exactly the same.

10,289. That is what I was going to ask you?—I say it is so largely.

10,290. Is there not the possibility that the risk is not the same?—The risk may be slightly less.

10,291. Is it slightly? It is not a question of greater or less risk, but are there not some kinds of risk which are eliminated if you have a Government enterprise?—Yes, to some extent.

10,292. Take it in stages. Take the difference between separate colliery concerns and a unified colliery trust. You would avoid the very considerable risk of litigation between the different colliery concerns and possibilities of their encroaching on one another underground, leading to romantic tales of, I will not say, fraud. By unification you would abolish that risk?—Yes.

10,293. Take the case of a mine. I do not know whether I use the right expression, but it is always apt to "peter out"?—Yes.

10,294. You find suddenly that the seam is not so good or there is a fault, and if you put your money into a mining company, you have to run the risk of that particular loss which may be a temporary one or a considerable or permanent loss. Does it not seem that that risk is to a large extent got rid of if you spread it over the whole of the mines?—Yes, but that is partly accounted for already if you are taking the average over a long period.

10,295. But the individual cannot very well do that and he cannot insure against that?—No, but off my 6 or 7 per cent. you would be taking the average of all the mines.

10,296. Do you think the market rate takes the average?—Of course it would be much more than 6 or 7 per cent. if one is concerned with the market rate of those mines which succeed.

10,297. If you buy shares in a joint stock company you are exposed, theoretically at any rate, to a certain risk of fraud and sharp practice—we have seen a good deal of it in America, let us say—whereas if you lend your money to the Government, you have a certain reliance that you are not exposed to that risk

of fraud and sharp practice. That is a real difference in risk, is it not?—Yes.

10,298. Consequently there is a real difference in risk between the Government enterprise and separate private enterprises, quite apart from any question of insurance?—Certainly.

10,299. And that real difference of risk is a national advantage?—Yes, the real difference.

10,300. Consequently, in so far as there is a real difference of risk, nationalisation is a gain to the whole community whoever gets it?—Yes.

10,301. With regard to the export trade, you hold out certain difficulties with regard to that under nationalisation. I suppose it would be quite possible, would it not, to leave the export trade in the hands of the firms which are now doing an export trade, the State simply selling the coal to them?—Yes, I should imagine it would.

10,302. Do they not buy the coal now very largely from collieries?—Yes, that is what I intended to suggest.

10,303. Therefore, it would be possible to nationalise the coal mines and run them under the Ministry of Mines, and yet sell the coal to export firms who take the whole business of export trade on themselves?—Yes; I intended to imply that.

10,304. And in that way take the whole export business upon themselves?—Yes.

10,305. *Mr. R. H. Tawney*: You have given a list of six possible forms of organisation, and I gather that of those six you think that the two against which there is least presumption is either leasing or nationalisation?—Yes.

10,306. Then you go on to state some of the possible criticisms on nationalisation, and I should like to ask you one or two questions about that. In the first place, is it not the case that these criticisms are very largely criticisms not merely upon nationalisation, but upon any kind of large scale organisation of industry?—Anything in the nature of unification.

10,307. That is to say, it is sometimes urged against nationalisation that it would produce the evils of bureaucracy and red tape?—Yes.

10,308. But I presume that is also a criticism upon any large scale organisation of private industry like railways, for example?—Yes.

10,309. That is to say, if one is considering the relative merits of public and private ownership, one must not ascribe to public ownership vices which are found in large-scale private ownership?—There is a distinction between "large-scale" and "unified."

10,310. There is a distinction of degree. Anything sufficiently large-scale is unified, is it not?—Yes.

10,311. With regard to nationalisation, is it not important to draw a distinction, which I think you do draw, between public ownership and public working?—Yes, certainly.

10,312. I mean, "nationalisation" is rather an ambiguous word, is it not?—Yes.

10,313. Sometimes it means public ownership alone and sometimes public ownership plus public working?—Yes.

10,314. And the criticisms made upon public working do not necessarily apply to public ownership, do they?—No.

10,315. That is to say, it would be quite possible to expropriate persons who now have a legal interest in coal mines without by doing so incurring the criticisms which are brought against management or administration?—Yes. The State could buy and then lease them out, as I suggest.

10,316. To take the first point, the question of private and public ownership. I should like to know a little more clearly, if you can develop it, what you feel about the relative merits of those in the case of coal?—It so largely turns upon the prices at which the mines would be bought.

10,317. We have heard a good deal of evidence as to the differential profits which are made by the more fertile or better situated collieries. Would it not be a fair criticism to say that it is somewhat wasteful to

23 April, 1919.]

PROFESSOR ARTHUR CECIL FIGOU.

[Continued.]

allow those differential profits to pass into private hands?—That, of course, depends entirely upon the price at which the State would buy the private interests out.

10,318. These profits are in the nature, are they not, of what economists call a rent or some kind of rent?—I should not call them a rent.

10,319. They are sometimes so called by economists?—I do not think they are called "rent," but they may be called the "quasi-rent."

10,320. That is to say, they are a surplus over and above what is necessary to attract capital into the industry?—Not necessarily; if you take the industry as a whole, they have to be set against the losses of the other mines.

10,321. Quite so; but the surpluses on the more fertile pits are in the nature of quasi-rent, and are not, therefore, discounted when people invest?—I should think they were discounted—except as regards profits got during the war.

10,322. Or during a boom in trade?—I should have thought they were. The price at which a man would sell, if people think they would make a lot of money in booms would be higher than if they do not.

10,323. As to the efficiency of State administration, I gather your argument against it is that if you remove the incentive of private profit, energy and initiative will fall off?—Not only that, but there is the fear of every one going by rule and doing exactly the same thing. I do not think it is merely profit.

10,324. Have you considered whether it is conceivable that the attitude of the workman might be wholly different if he were working for the public? For instance, workmen at the present time are bound by rules even although they are not employed by the State. Is it not possible that they might be in a position to work with better will and throw more energy into their work and even offer constructive suggestions if they were employed by the State?—It would be a gain if they did, but I have no knowledge with regard to that subject.

10,325. In speaking of State control discouraging initiative, one should take account of the fact that although it may be discouraging certain persons, it will greatly encourage the initiative of a much larger number of other persons, namely, the workmen whose initiative is rather discouraged now?—Yes, but on the other hand it may discourage them.

10,326. That is a matter for evidence?—It is largely a matter of guessing, I think.

10,327. *Sir L. Chiozza Money*: May I ask you one or two questions on the relative efficiency of public and private enterprises? I think it is your opinion, is it not, that when an economic undertaking reaches a certain size there is no great difference in the amount of efficiency likely to be expected from it, whether that undertaking be a private or public enterprise?—It depends entirely upon the nature of the Government and the nature of the administration. I do not think one can say in a general way that one is likely to be more efficient than the other without reference to the nature of the Government.

10,328. That is what I gather from your précis. Has it been the result of your enquiries that if, for example, you take a great American Trust, such as the United States Steel Corporation, its relative efficiency is less than that of the individual members of the British iron trade?—I have no knowledge of that.

10,329. You could not give any testimony on that?—No.

10,330. You have no reason to believe the American Steel Trust is less efficient than the little, petty ironmasters of our own country?—Of course, it has effected a great number of economies in unification, but I think to give evidence of that sort of thing one would have to have detailed knowledge of the industries.

10,331. You have no reason to believe it is less efficient than our ironmasters?—No, I have no knowledge on the subject.

10,332. It does not follow that as an economic undertaking grows in size it becomes less efficient automatically, does it?—No, it does not follow.

10,333. So that it is not on the score of size that any accusation of inefficiency necessarily lies?—I do not think anything could be demonstrated about these comparative advantages in a general way.

10,334. As a matter of fact, is there anything to show that, for example, the national railways of Germany are less efficient than the individual railways of our own country?—There, of course, all the conditions are so different. They were laid down largely as military railways and run on military principles. It is extraordinarily difficult to draw any inferences from these statistical comparisons, because the conditions are so different.

10,335. It is not statistical, but comparing locomotives with locomotives and carriages with carriages and wagons with wagons. They are purely technical matters. Have you ever had the opportunity of comparing them?—I have been in the railway carriages.

10,336. Have you any reason to think the railway wagons of our own country were more efficient than the railway wagons of Germany? As a matter of fact, were they or were they not?—If the answer had to be yes or no, I should say no.

10,337. It is well known that our own wagons are not so efficient as those of Germany?—Of course, efficiency ought to be taken with regard to cost.

10,338. Are you aware that some of our railway companies were so impressed that they sent a commission over to Germany, and they found that not only were their wagons standardised, as ours were not, but that they were working on a system of pooling which these particular railway companies who were interested in the commission thought it wise to adopt here?—I will take it from you that that is so.

10,339. Does not that rather point to the large national State organisations of Germany being more efficient and not less efficient than ours?—There are two questions, and first of all there is the question of fact.

10,340. Yes; it is a question of fact purely, and I am asking you on the question of fact?—By "efficiency" you mean absolute efficiency without reference to what the things cost?

10,341. Yes; absolute efficiency?—My knowledge merely consists in having gone in them. I could not notice much difference, but I have no knowledge, because I have not studied it.

10,342. Have you had any opportunity of considering the electrical undertakings of London?—No.

10,343. Are you aware that the municipal electrical undertakings of London under public management and control do produce electricity cheaper than the privately owned undertakings of London? Have you any information on that?—I should have to go through the statistics before I could answer.

10,344. If I may bring you to the coal industry, is it within your knowledge that the products of coal cover a very wide range such as dyes, colours, medicines, explosives and so on? Are you aware that in this country before the war these industries, both in their final and intermediate stages, were gravely neglected?—I am aware they were not carried so far as in Germany.

10,345. Are you aware that they were so gravely neglected that when the war broke out we were plunged into imminent danger?—That is a matter of opinion.

10,346. Is it the fact that we were without toluol in any large quantities?—I do not know really about that.

10,347. It is within your knowledge that the Government set up an Explosives Supply Department that took these things in hand, and in the course of about 2 years or less produced enormous quantities of these by-products and final products and saved us from the disaster which threatened us?—I know the Ministry of Munitions produced these products.

10,348. Are you aware that the Explosives Department, a State Department, saved this country from the consequences of the capitalistic neglect of these industries?—I could not answer that.

23 April, 1919.]

PROFESSOR ARTHUR CECIL PIGOU.

[Continued.]

10,349. If you were told, as a matter of fact, that large quantities of these products were produced under Government initiative and control in about 2 years, whereas they had been neglected for a generation in this country, would you consider that a testimony to Government control, operation and initiative?—I think when a lot of explosives are wanted for a war the Government must make them, but one does not want them in peace time.

10,350. Are you aware that these intermediate products which, in one sense, branch off to explosives in war, in another sense branch off into valuable peace products in times of peace; in other words, was that not a neglect for peace just as much as for war?—I do not think that follows. From the fact that we did not produce these things it does not follow that they were things we should have produced.

10,351. Will you take it from me that those relative industries are just as valuable for peace as for war, and the neglect for peace was as great as that for war?—That is not my point. My point is that because we did not produce them it does not follow there was real neglect; it may have been more economical to make other things and import what was not made with the produce of these other things which were made.

10,352. Are you aware that it is agreed we must have these basic key industries?—I follow that.

10,353. Therefore, it follows it was real neglect for peace time before the war?—I do not think that follows.

10,354. Take one other industry on the question of public enterprise and private initiative, namely, housing, which has relation to miners and other people. That is a great industry, is it not? It is an obvious industry?—Yes.

10,355. If, then, we can confidently look to private enterprise for the best results in every industry, how do you account for the condition of the housing question in this country at the present moment?—I have never advanced an argument that we can confidently look to private enterprise in every industry.

10,356. I suggest to you there is an obvious thing. Toluol you might not think of because it is out of sight and mind, but houses you can think of because they are not out of sight and mind. If houses are neglected how can you account for the neglect of such a thing as houses and the housing of civilised people? If we can confidently look to capitalism for the solution of these problems, how do you account for the capitalistic neglect of houses?—It is not part of my contention that we can confidently look to capitalism for everything.

10,357. You do not want to press it so far as that?—No, not to make a universal general statement. I state carefully at the beginning of my proof that the thing cannot be settled on questions of principle.

10,358. *Sir Arthur Duckham*: With regard to this Plan No. 1 of yours, when you say unification in a private combine is not practical politics, would that include any system of syndicalism where you have the ownership absolutely and presumably with the workers and private ownership in that way?—What I was thinking of was the suggestion that the whole of the mining industry should be unified under State auspices and handed over to a private concern.

10,359. Any sort of private concern?—Yes.

10,360. So that it would include syndicalism?—You mean a system under which there is a sort of internal combination? Yes, I think it would include that, but I suggest here that the thing is not practicable.

10,361. I did not know whether you would give it the full breadth?—Yes. I was not thinking of it at the time.

10,362. You speak of the "perfectly wise autocrat." I presume you feel from this that an autocrat is the best way to run a concern. You want someone who has the final word. Is that the way you put the "perfectly wise autocrat"?—My contention was that these things could be done if the Government always acted perfectly wisely, but the question of doubt was how wisely the Government would act.

10,363. You would not use "autocrat" in the sense of a single person, but, possibly, the Government?—I was thinking from the point of view of the Government.

10,364. Or a Committee?—Yes, there might be a Committee assisting the Minister.

10,365. But, ultimately, an autocrat?—There must be someone ultimately responsible to Parliament under a national organisation.

10,366. *Mr. Evan Williams*: You have simply devoted yourself to making a comparison between the alternatives to private ownership?—Yes.

10,367. If you had made a comparison, would you say there is any advantage attached to nationalisation or any sort of unification that cannot be brought about by private ownership?—My difficulty in all of this is that most of the things could be brought about under either plan, but the thing is what would happen or is likely to happen. I do not think there is an absolute impossibility on either side.

10,368. Do you not think private enterprise and initiative have been the strongest factors in progress in the history of this country and every other country?—I know that is partly so because it has gone on so much longer than Government action.

10,369. Is it your view that it is likely to continue to be so?—Of course, every improvement in the machinery of government increases the case for Government action, and the machinery of government is much better than it was, say, one hundred years ago.

10,370. With regard to efficient management of a concern, I take it you will agree that the ultimate responsibility must rest with one man?—The ultimate responsibility, I should think, must.

10,371. Is a concern likely to be more efficiently managed when it becomes so great that one man cannot keep it under his eye, so to speak—if it becomes so great that it is beyond the power of one man?—I suppose with improvements of organisation one man can supervise a larger concern; it depends upon how it is organised underneath him.

10,372. Do you think the coal industry is such that it is possible to have very large units of organisation?—It depends upon the detail of the coal industry, of which I have not any actual knowledge.

10,373. Do you think there is any industry in the country which has so many differences between one unit and another as the coal industry?—That is really outside my knowledge.

10,374. You are aware, are you not, that there are differences between district and district, pit and pit, and seam and seam?—Yes, but my knowledge of all that is quite second-hand.

10,375. Assuming that is so, is an industry that has so many variations and differences in it one that lends itself to nationalisation so well as a simple one?—No, the greater the differences the greater the difficulties of nationalisation, but I cannot evaluate it at all.

10,376. But if an industry is such that there are large variations and differences in it, that industry is consequently more difficult to nationalise than an industry which is comparatively simple in every department, is it not?—I should have thought so.

10,377. If the coal industry is the most varied industry in this country, do you think it should be the first to be nationalised, or the last?—Of course, the variations are not the only relevant factor.

10,378. But they are relevant factors, are they not?—They are relevant factors, of course.

10,379. And they increase the difficulty of nationalisation?—Certainly.

10,380. Or of unification?—Of unification, so far as management and organisation go, but, of course, not necessarily for the transport of the coal.

10,381. Generally speaking, taking the advantage to the nation as a whole, do you expect that there would be any increased advantage from nationalisation that cannot be obtained by private ownership?—Of course, that, again, depends upon the detail. As I say at the start, it cannot be settled by general principles and I have no knowledge of the details.

10,382. You have not enough knowledge of the coal trade to say?—No.

23 April, 1919.]

PROFESSOR ARTHUR CECIL FIGOU.

[Continued

10,383. *Mr. R. W. Cooper*: Have you studied any of the coal trade statistics at all?—No, not properly. I have really no special knowledge of the coal trade.

10,384. For example, have you addressed your mind to figures or Government returns to see what has been the growth of the coal industry in Great Britain?—I only know in a general way.

10,385. Merely that it has grown very largely in the last 30 years?—Yes.

10,386. Of course, in an equally general way, I suppose, you know that coal-mining is a very risky speculation?—Yes.

10,387. And that it becomes particularly risky when you are winning—you know what I mean by the word "winning"—an unknown coalfield?—Yes.

10,388. The winning of that coalfield, if it be successful, is a public benefit?—Yes.

10,389. But the risk attached to it is great and the length of time involved before the coal is won is great?—Yes.

10,390. That is until you can command the coal. Do you think the State would be willing to run the risk of embarking large sums of public money in a speculation of that description?—That, again, depends entirely on the kind of State Minister appointed.

10,391. It depends upon the "perfectly wise autocrat"?—Yes. I have no means of estimating how wise he would be.

10,392. I gather, from your using the expression, that you have no reasonable hope that in the present we shall ever see such a man?—Not a perfectly wise autocrat.

10,393. On the question of housing for the moment, I gather you say that that in your opinion is a national concern?—I do not mean that the nation should build houses.

10,394. No. That is my insufficient language. It rather is a matter for those branches of the Executive Government of the nation which are charged particularly with looking after the health of the people?—I should have thought so.

10,395. As regards stimulating other individuals or minor local authorities to do their duty, you probably know as a matter of common knowledge the present Government are now promoting a Bill giving increased powers to the chief executive authority, the Local Government Board, to compel the minor authorities to do their duty?—Yes.

10,396. Of course, the views or complexion of the minor authority depend upon the persons who compose that authority?—Yes.

10,397. That depends upon the voter who sends them there?—Yes, and the people who influence the voter.

10,398. I quite agree. Do you think that under State management there is the same likelihood of promotion by merit as there is under private enterprise?—That again depends entirely upon the wisdom of my autocrat.

10,399. With the present standard of wisdom exhibited in the British Government do you think there is the same likelihood of promotion by merit as there is in private enterprise in Great Britain just now?—I would not like to say.

10,400. Now with regard to the question of the payment of these officials, I suppose even with the most perfectly organised State the question of pay is not a matter of no importance?—No.

10,401. I mean the payment of the officials?—No, it is of considerable importance.

10,402. Do you think the State would be likely to pay its officials as well as persons engaged in private enterprise?—Probably not; but against that there is the fact that people might be willing to work for the State for less than they would require from private enterprise.

10,403. Why should they, except on the off-chance of earning their pension at the age of 65?—Because they like to do a public service.

10,404. Do you really think all the thousands of clerks and officials from the highest to the lowest in the British Government service now are animated

simply by the desire to render a public service?—Not simply. A man might be quite prepared to take less as a Government servant than as a private employee.

10,405. Although he might have a chance of ultimate promotion by his private employer. Take the young man who sees a chance of becoming a partner and obtaining a position in the world; which would he do, go into the service of a first-class firm or into the service of the Government?—A great number of people from the Universities take Civil Service appointments in which they earn less than they might in other employment.

10,406. In India, for instance?—Yes, it depends upon the man.

10,407. Do you not think there are special attractions about the Indian Civil Service that do not apply to the English Civil Service?—Yes, the best go for the English Civil Service.

10,408. The best?—The people at the head of the Civil Service lists generally take English appointments.

10,409. I am not for a moment saying anything in disparagement of any English Civil Servant. You suggest a possible plan of the Government owning the minerals and leasing them?—Yes.

10,410. The Crown at present, which is the Government, own minerals and do lease them?—I mean buying up the mines and leasing them.

10,411. And imposing as a result certain special conditions which at present the Government do not impose when they lease their own minerals?—Yes.

10,412. *Mr. Arthur Balfour*: Provided it was decided to nationalise the coal mines, I take it you agree the present owners should be adequately compensated?—That the shareholders should be bought out?

10,413. Adequately compensated?—"Adequately" is ambiguous.

10,414. They should be compensated?—Yes, certainly.

10,415. The only way of doing that would be to provide public money or pledge the public credit by the means of Bonds, and so on?—Yes.

10,416. That being the case, Parliament would insist upon having control and the Treasury would insist upon having some complete control over the industry?—That would depend upon the terms on which the Minister of Mines was appointed.

10,417. Would the House of Commons agree to appoint a Minister of Mines who did not have control?—I do not think the Treasury would have control over the Minister of Mines any more than over the War Office.

10,418. Parliament has control of the Treasury?—Yes, Parliament has control of the Treasury.

10,419. And Parliament would insist again if the public credit was pledged, that they had complete control over the industry?—Parliament would have control over the Minister of Mines in the same way that it has control over the Secretary of State for War to-day.

10,420. The Minister of Mines must have control or he would not be responsible to Parliament?—He would possess ultimate responsibility, but that does not prevent him being assisted by a council.

10,421. He would be responsible?—Yes, he must be.

10,422. There is no means of removing nationalised coal mines from political influence?—Parliament would insist upon having control.

10,423. The ownership of the coal mines would be under the influence of political pressure?—In the sense that the War Office is under the influence of political pressure.

10,424. Have you any experience of any industry which has been managed by the Government under normal conditions?—No personal experience of any industry at all.

10,425. Do you know of any precedent anywhere in the world to which we can turn, which would be valuable to us in considering the nationalisation of coal mines in this country?—I do not myself think much can be got out of these comparisons, because, as I said, the conditions are always so different. There are a great number of things run by central or local governments in various countries.

23 April, 1919.]

PROFESSOR ARTHUR CECIL PIGOU.

[Continued.]

10,426. Would you be prepared to risk such a big thing as the nationalisation of the Empire's coal with no experience to go upon of any consequence?—I make it quite clear I am not advocating any definite plan. I have not any special knowledge of this industry. I am not advocating any particular arrangement; I have not the knowledge to do it. If I had six months in which to think it over and go into it I might have an opinion.

10,427. You realise there are 3,000 different undertakings. We are not talking about a thing in which there are only 20 or 100; but we are talking about 3,000 different undertakings at the present time?—Yes.

10,428. Can you conceive any Government Minister of Mines who could properly control 3,000 different undertakings?—I think it would be very difficult. I am not prepared to say it would be impossible; I have no knowledge.

10,429. How would you make it possible, by the appointment of hundreds of inspectors who would inspect the coal mines?—I suppose he would make use of the experts. He would not manage them off his own bat from an office in London.

10,430. He would have to pay them at least what is paid by private enterprise at the present time?—There or thereabouts.

10,431. You would not reduce them?—It would be somewhere thereabouts.

10,432. A question was asked regarding the German railways. The German railways were run as a military machine?—Largely, I believe.

10,433. Can you conceive the workers of this country being willing to be treated as military units as the employees of the German State railway were?—No, I do not think they are at all likely to agree to that.

10,434. You know, of course, the Germans had a large nationalised standing army before the war?—I know that.

10,435. It is stated the Navy and the War Departments paid the railways for the transit of their military stores, &c., who made profit out of the arrangement?—I do not know the arrangement of the payment. It was run on a strategic basis.

10,436. A good deal of the profit or much of the profit produced on the German State railway was taken out of the Navy and Army estimates of Germany?—Possibly.

10,437. And it was not an ordinary trading profit in the sense our railways have to show a trading profit?—I should think so; I have no knowledge of it.

10,438. On the question of housing, Parliament years ago passed Acts instructing Local Authorities to deal with the housing question which was not dealt with adequately by private enterprise or private capital, as you say?—Not as I say. That was not my phrase.

10,439. I thought it was your expression. You said private capital had not found sufficient housing?—That was the questioner's point.

10,440. It is a fact, is it not, that there were these Acts authorising the Local Authorities to erect the houses if they were not provided in the ordinary way?—Yes, but I cannot remember the details of the Acts.

10,441. Will you take it from me there were Acts?—There were some Acts.

10,442. Why has Parliament neglected to see that that public service was done?—Why has it neglected it?

10,443. Yes?—I cannot answer that.

10,444. You feel willing to entrust to a Parliament, which is neglecting the housing of this country, the running of the coal mines?—You are again making me an advocate.

10,445. I am asking you, are you suggesting that Parliament which has neglected such an obvious thing as the housing of the people in this country, is a proper and capable body to control the coal mines of this country?—I should like to have six months and all the evidence available before me before I give an answer to that.

10,446. You told us that with regard to the schemes for nationalisation the one you advocated was the ideal?—That was not my intention. My intention was to set out these various plans and suggest certain lines of relevant considerations. I cannot myself estimate the quantity of importance of these different considerations; I have not the detailed knowledge.

10,447. I will take you to another point. Sir Leo asked you a question why certain explosives were not produced in this country, and was it not neglect on the part of the Government of this country not to produce the explosives necessary for the defence of the Realm?—In a sense it was neglect; whether it was a blameable neglect is another question of course. Nobody expected a war like this to happen.

10,448. The Government who should have provided those explosives and in providing them would have produced the by-product do you consider are competent people to place the whole coal-mining industry in this country in the hands of?—I quite agree the Government is certain to do inefficient things, and in any other form of management there would be inefficient things done; but proving that the Government has certain inefficiencies does not demonstrate they ought not to undertake the work. In every system you have inefficiency.

10,449. The providing of houses and providing the necessary explosives is probably a simple thing to running 3,000 coal mines in this country?—The providing of houses is ambiguous. There are two things. The providing of houses and paying for them, and the passing of rules as to the minimum conditions in which you allow the houses to be.

10,450. The Act of Parliament passed by the House of Commons was that if sufficient houses are not provided the local authorities should levy rates on the district and build those houses?—I have forgotten the details of that; I remember them very vaguely.

10,451. *Mr. Herbert Smith*: Tell us where we can find that?—It is in part 3 of the Act. It is the Housing Act, I think.

10,452. *Chairman*: 1890 was the Housing of the Working Classes Act?—It is in the 3rd part of that Act.

10,453. *Mr. Robert Smillie*: Might it not be one reason why the Government did not manufacture explosives because Mr. Balfour's class did not want them to do so?—I do not know about the explosives. It has been rather dragged in.

10,454. Is it not a fact that the owners of industries and the capitalist class have not evinced any desire for the Government to take part in producing anything as a Government? Have they not told the Government it is not their business to enter into competition with private producers?—Yes, as far as my knowledge goes. There was no suggestion of providing these explosives before the war.

10,455. Nor of building houses either. Have you ever known a capitalist class encourage the Government to build houses?—The capitalist class is a vague phrase.

10,456. I mean the employing class; the people who live on invested capital. Have you ever known them to encourage the Government to go in for building or manufacturing or anything else? Have they not always told the Government that is not their business? Is not that the general feeling now? There ought to be an answer to a question of that kind?—With regard to 45,000,000 people I cannot answer for their opinions. I gather your real point is that people engaged in private industries are more or less against the Government competing in industry.

10,457. Do you think the coalowners, to come direct to the point, or the colliery owners, are anxious that the Government should take over the mines and work them?—I understand not.

10,458. That is well known. Are the employers in any other industry anxious that the Government should take over the industry and work it?—Not that I am aware of.

10,459. Have they ever been?—It depends partly on the price they expect to get. I imagine, not on the whole.

23 April, 1919.]

PROFESSOR ARTHUR CECIL FIGOU.

[Continued.]

10,460. You said, in answer to Mr. Cooper, you know the coal was a risky industry in which to invest capital?—To try a new mine.

Mr. Cooper: I put a new mine.

10,461. *Mr. Robert Smillie:* Do you know sufficient of coal mining to know that it is a risky business to begin to develop a new mine?—I have no detailed knowledge of the coal industry at all.

10,462. Can you give any facts to justify your answer that it is a risky business and, if so, where does the risk come in?—I have no special knowledge of that.

10,463. You said Yes to that question, which is a most remarkable thing for a Professor to say. I understood you to give a direct answer. You did say Yes on that occasion. Mr. Hodges said you would not say yes or no, and I said you would before you finished to-day?—I suppose the idea was if you dig down for coal and you do not find as much as you expect you lose your money.

10,464. Are you aware in good mining they usually bore before they dig down?—Yes. I know that.

10,465. Are you aware it is not the owners of the minerals that bore, but somebody else?—It is the company, I suppose.

10,466. It is not the owner of the minerals or the owner of the mine who is ultimately to get the royalty rent that does the boring; he leaves that to other people to do. Are you aware of that?—I did not know that.

10,467. Are you aware, perhaps you are not, and I put it that it would be a foolish thing to sink a pit at some place unless you had first endeavoured to find out if there was coal there?—Yes, to sink a complete pit.

10,468. Do you know where they bore for coal they cannot merely ascertain if there is coal there but tell the thickness of the seams there?—I do not know about the industry.

10,469. Are you aware by boring you can tell the thickness, generally speaking, and the quality of the coal?—I had a general idea of that.

10,470. Where does the risk come in?—I imagine they did not know how much coal there was in the mine. If you tell me that they did, all I can say is I have no knowledge of this.

10,471. You may take it that careful mine managers and mine owners intend to make sure whether or not coal is in the ground before they sink and the extent of the coalfield, the thickness of the seams and the quality, and if it is there which can be ascertained by boring.

Mr. R. W. Cooper: What about the intervening strata? I am thinking of a place in Durham where it took 10 years before they got to the coal.

Mr. Robert Smillie: You put it as a risky business.

Mr. R. W. Cooper: So it is; it took 10 years before they got to the coal.

10,472. *Mr. Robert Smillie:* You know it is not a risky business. You say one thing should be done and that is the Government should buy out the mines and lease them to companies. What difference would that make? Would not that be still leaving the mining industry in the hands of private individuals?—It would make a difference in that it would give the Government a greater power of control. It could always stop a lease if it did not think this particular mine was being worked well. It would have the power of operating a particular mine itself experimentally.

10,473. It would not have power to stop the lease until the period expired?—No, I mean at the end of the lease.

10,474. Do not you know the present owners or the people who claim to be the owners of the minerals have the power to stop at the end of the lease and refuse to grant a new lease?—Yes. If the Government had that in its hands it could exercise great pressure. I should have thought its position against the operators would be stronger than when it stands entirely outside.

10,475. Would it not still leave the public open to the danger of being fleeced by a private mine-owner?—Not if the Government imposed certain conditions when they granted the lease.

10,476. If the Government imposed certain conditions when they granted the lease as to working the mines and the price, would it not be as well for the Government to work them themselves?—On the leasing plan it would take two bites at a cherry. It would not be committed to this big experiment all at once.

10,477. Do you know any real difference between coal mining and any other industry which would justify national ownership? Do you know any difference between the cotton industry and the coal industry?—The coal industry is much more fundamental. Supposing the Government nationalised the railways, that would be a strong argument for owning the coal it is going to use on the railways.

10,478. Is it not a very important reason that coal cannot be replaced; it is not a product of human ingenuity or skill. Does that not make coal a different industry from any other?—It is of course a difference.

10,479. Is it not the fact that other industries of this country depend almost entirely for their existence upon coal?—Yes.

10,480. Are you aware that millions of tons of coal have been lost beyond recovery because of private ownership?—I know a great deal has been lost, but whether it would not have been lost under Government is a different question.

10,481. Have you read the evidence upon the question?—Some of it has been sent to me.

10,482. Have you read the evidence of mining experts dealing with the question of barriers which were left in on account of flooding?—I know nothing of that; that is a technical point.

10,483. I suppose you are aware that a million persons, men, women and children, are engaged in the mining industry?—Yes.

10,484. I suppose you might take it that the care of that million of human beings ought to be a very important question in the working of the coal mines?—Yes, certainly.

10,485. Not only their safety when at work, but their care when they are away from their work?—Yes.

10,486. Do you think if the coal mines of this country had been Government property and been exploited by the Government that the Government dare have left their miners in the kind of houses that many of the miners are living in to-day?—I have no special knowledge of that.

10,487. Do you know anything about the housing conditions of a large body of miners in this country?—I have read some of the evidence about it.

10,488. Is not that sufficient, if it is true, and I do not think you have read anything that is nearly as bad as the thing really is; but if that is true, could you not give an answer to the question: Dare the Government, had they owned the mines, have kept their workmen in such houses as you have seen described in that evidence? Could they have remained a Government for a very long time under those conditions?—I think the probability is the houses would have been better, but I do not think that is a conclusive argument for the Government owning the mines. The Government might make rules about the houses.

10,489. Ought it not to be a good reason why there should be a change?—As regards the companies, certainly.

10,490. I am dealing with houses owned by the mining companies, erected by the mining companies and owned by them which are unfit for human beings to live in. If that is so, ought it not to be a strong argument why these people should give up the mines to somebody who could take better care of them?—It is a strong argument that the Government should prevent houses of this class being lived in.

10,491. Are you aware that German firms sent over representatives to this country and built coke ovens at many of the coal mines in this country, and extracted the by-products from the coal and carried those by-products away to Germany and made dyes with those by-products that entered into competition in this country and wiped out our industry here?—I do

23 April, 1919.]

PROFESSOR ARTHUR CECIL PIGOU.

[Continued.]

not know about that. I have no knowledge of that. I am not suggesting it is not so, but I am without knowledge.

10,492. It is, of course, known to many people that that is so. Are you aware that a large number of our soldiers were killed in the recent war by explosives made from by-products produced in Yorkshire and other counties?—I was not aware of that.

10,493. If that were so, that the Germans came over here and put down coking plants at our works and exploited the by-products, did that show very much initiative on the part of the mine owners in this country?—No; so far that would be evidence against their initiative.

10,494. If you were told, or if you could conceive yourself from the evidence, that national ownership of the mines would improve the safety of the mine workers, would that be a strong reason for nationalising mines?—Yes, certainly.

10,495. If it could be proved by unmistakable evidence that in many cases the output was the first thing considered before safety, would that make any difference to you?—Yes, certainly.

10,496. I am not saying at the moment that that is so. I am putting to you if it is proved to your satisfaction that that were so?—Certainly.

10,497. Have you any idea as to what the record of the managers, generally speaking, in the coal industry is in the matter of salary?—No.

10,498. It was put that probably the Government would not pay as huge salaries as private people. Would you be surprised to know that up till the war broke out there were managers of collieries in Great Britain at less than £300 a year?—Yes, I should be surprised to know that.

10,499. Would you be surprised to know there were colliery managers managing some 300 or 400 miners whose salaries were less than £200 a year?—Yes.

10,500. Would you be surprised if the Government nationalised the mines they would offer such salaries as that to managers who are responsible for the safety of the mines?—You mean a manager of a mine?

10,501. Yes, in the mines a manager holding a first class certificate?—My guess would be the salary would be much higher.

10,502. I suppose you would guess about £1,000 for a job of that kind?—You put that figure, perhaps it would be something like that. I have no knowledge of the subject.

10,503. I suppose the Government pays £1,000 a year to so many people who do far less than coal managers, and would you not risk saying they pay £10,000 a year to people who do a great deal less?—I had better not answer that question.

10,504. I am leaving the Chairman out for the moment. His turn has not come yet. I think a great many business people have given their services to the Government during the last four years free?—Yes.

10,505. You have heard of that?—Yes.

10,506. Perhaps you yourself have been in that position; a great many professors have, as well as business people. They say they have done so on the ground that their country required their services, and they gave them free?—Yes.

10,507. Many round this table, business people, have given their services quite free because they thought it their duty. Do you think that if the question of the elimination of private property in the mining trade was brought about that those people who have given their services to the country would suddenly withdraw all their services? I mean to put it to you could you not trust a mine manager or one of the present mine owners to give his honest service to the State the same as to the present company he is attached to?—If he got no money at all he could not do permanently what he could do for a short period during the war.

10,508. Do not you think that in addition to serving the State he would get a salary, that would be an inducement to do his best?—I think the feeling of serving the State would enable a person to accept a smaller salary from the State than in private enterprise, in the case of a good number of people.

10,509. Might I take it from you that if you think an employer or a colliery manager would give his best service to the State, do not you also think that ordinary workmen would in all probability give better service to the State than if they knew they were working and producing a profit for other people?—I think a number of people would be prepared to take less from the State than private enterprise.

10,510. *Mr. Frank Hodges*: I would like to draw attention to the second paragraph in the précis of your evidence. You say "Nationalisation in any sense cannot be judged on grounds of general principle." What do you mean exactly by that?—I mean you would want to consider every particular industry and that a large part of the relevant evidence would be the detailed state of that industry and the detailed nature of the Governmental machinery available. One cannot say in the air nationalisation is better than private enterprise in a general way or the reverse.

10,511. Does that really prevent you making the generalisation that a given industry should be worked at the greatest point of efficiency in the interests of the greatest number of people?—That is rather ambiguous.

10,512. Not so ambiguous as it appears, I believe. I put it to you, you say that nationalisation cannot be judged on the ground of a general principle. Suppose you had as a general principle that a given industry should be worked at the highest point of efficiency and that it should be worked in the interests of the greatest number of people?—Efficiency being used with some reference to cost.

10,513. With reference to productivity?—You can increase a product by employing a great deal more resources. If to double the output you required 40 times as much resources, that would be in one sense an increase in efficiency but not in another. I do not know in which way you are using the word.

10,514. Not the cost, but the value of the commodity. I appreciate your point. It might not then be described as efficient?—I want to get clear the sense in which you use the term "efficiency." In one sense I agree with what you say.

10,515. The increase of productivity?—Yes.

10,516. Relatively to cost?—Yes.

10,517. If some such scheme as nationalisation indicates you can have those two things would you not arrive at a general principle that was sound?—Yes. If you take your principle far enough off. You say as a general principle that the better system should be introduced, but my difficulty is to find a more proximate principle than that. If nationalisation produces better results than private ownership you ought to have nationalisation. I can lay down a general principle in that sense.

10,518. Look at the paragraph more closely. I do not quite understand it. You say what would work well under one kind of government would work badly under another. Do you mean to say the Post Office is worse under liberalism and better under conservatism, or *vice versa*?—I meant under one kind of Government, say, a bureaucratic as against a democratic system.

10,519. All kinds of Government hitherto have been bureaucratic?—I draw a distinction between, say, the German system of government and the British system of government. It does not follow that a system that could be worked well under one sort of Government could be worked well under another. I did not mean one political party; I mean the way in which the Civil Service is worked, and things like that.

10,520. Did you not have any historical basis for the generalisation that what would work well under one Government would work badly under another. If you have no historical basis, then that is a pure speculation?—In a sense it is a pure speculation; surely that is obvious; if your Government is sufficiently bad it could not work anything.

10,521. That depends upon the degree of power the Government exercises over the industry which it presumably owns. For example, take the Post Office. I do not suppose it can be urged by you that the Post Office is worse administered under one form of

23 April, 1919.]

PROFESSOR ARTHUR CECIL FIGOU.

[Continued.]

government as compared with another. The Post Office has been in being during many different Governments?—We are at cross purposes as to what one means by "form of government." I did not mean to distinguish between liberalism and conservatism.

10,522. I only used that term; I mean the different forms of government that have been in the past?—Suppose you had a Government the essence of which was that anybody would do anything he was bribed to do; that Government would be less suitable to conduct the industry than one in which there was no bribery. That is a mere general statement. Surely it is obvious.

10,523. I thought the impression you wanted to create in that paragraph was that an undertaking nationally owned would be subject to some form of political pressure?—That was not my intention at all in that paragraph. Perhaps I put it badly. I merely meant to suggest you have to consider the character of the industry and the nature of the Government machinery to be applied before you can say whether nationalisation is desirable.

10,524. What constitutes an industry like the Post Office is not the Government; it is the permanent staff?—Yes.

10,525. From the postman to the Postmaster-General, who is the only man affected by political changes?—Yes.

10,526. The industry remains intact apart from the political changes?—I include under my notion of Government all the machinery. Perhaps we are at cross purposes.

10,527. The impression you wanted to convey in that paragraph was the industry in some manner or other would be affected by the kind of political personages that were on the field of activities at the time?—No, you had the spoils system in England under which the staff went out as the Government changed. Now you have all the people there and only the political heads change.

10,528. Now come back to private enterprise, which appears to give us a considerable amount of concern. It has been stated in evidence before the Commission that there are 37,000 shareholders in the mining industry, and, if you put those included in the allied industries, there are 94,000 shareholders, that is holders of capital. How do these 37,000 shareholders function as holders of capital in the initiative required in the industry or do they function at all?—I am a very small shareholder, and I certainly do not function at all.

10,529. Therefore why should you be so exercised that private initiative will be destroyed if these 37,000 shareholders pass out of existence?—It is not the merely passing out of existence of 37,000 shareholders. That will bring you to the leasing system.

10,530. As a matter of fact, these shareholders are already divorced from the active participation in the control of the industry?—Yes, the shareholders are.

10,531. They are holders of private capital?—Yes.

10,532. The initiative, if there is any initiative at all, is the initiative of people who act as trustees for the shareholders?—Yes.

10,533. Who may have capital in the industry and who may not?—Yes.

10,534. What is the particular lure for these men to put more into the industry on behalf of the 37,000 shareholders as against the whole nation?—I do not understand.

10,536. What makes the people who are working for 37,000 shareholders display greater initiative than they would, in your opinion, display if they were working for 40,000,000 people, which would represent the nation?—The main distinction, it seems to me, is if you had it nationalised they would all be liable to work according to one rule, so you would do away with such stimulus to suggest improvements as there is when there are a number of different concerns acting more or less independently.

10,537. Is that borne out in fact? Take the Army. The Army had 6,000,000 men comprised in it and was a national institution. The war was

fought on a nationalised plan. The Army was not a private company, neither was it run by a private company. Did these 6,000,000 men display any lack of initiative, or any number of them?—Of course, that is a question of military history.

10,538. Not at all. Is it not a question that the Army is a nationalised institution; it is nationally owned. I am not suggesting the Army could be anything else?—It is a thing that must be nationally owned.

10,539. Is initiative permissible in the Army?—So far as I know, initiative is rather difficult in the lower parts of the Army. I have no knowledge.

10,540. Is there any initiative in the Army, or is it worked to a rule, as you suggest?—It was worked largely to a rule. I do not quite see the drift of all this.

10,541. I want to put to you, it is stated the war has been won by 6,000,000 men, and those 6,000,000 men are in a nationalised institution?—Yes.

10,542. A Government controlled institution. I put it to you, all the initiative that has been necessary for the winning of the war has been secured within the nationalised institution. Why should there not be a similar institution where you have only 1,000,000 men concerned in industry?—The conduct of an army is entirely different from the conduct of an industry; they do different things.

10,543. One produces, the other destroys; I agree with that. In effect they are both performing national services, are they not?—Yes.

10,544. Do you suggest that it could conceivably be better for the Army to be run by a private company?—Certainly not.

10,545. What do you consider is the motive in industry at the present moment?—There are several motives. One obvious motive is to get profit out of it.

10,546. That is the whole of it?—I gather people in industry work because they really like to do it well when doing a thing.

10,547. Take the case of a coal manager, he may not be a holder of capital in the industry at all. What he is doing is exercising all the initiative that a colliery manager can exercise in the interest of getting profit for someone else?—Largely. If a person is doing a job he likes to do it well.

10,548. Exactly. Therefore, do you suggest that because he is serving a larger number of individuals he would display less interest in his work?—No, certainly not; that would not be the reason.

10,549. Have you considered syndicalism as a solution to the problem of initiative?—I have read a little about syndicalism.

10,550. Suppose I were to put it to you that if industries were to pass from private ownership to the ownership of the workers because of the fears you have about bureaucratic control, justifiable fears, I might say, what would be your attitude towards that proposition?—Of course, it would have to be guarded against the danger that this syndicate should mulct the general consumer of coal.

10,551. In what way?—By charging high prices. If you have a complete monopoly, whether syndicalist or any other monopoly, there is that danger to be guarded against.

10,552. Are you aware there is a growing feeling amongst the workers that they could take over the industry?—In a general way, yes.

10,553. You would regard it as a source of danger to take it over exclusively and own it exclusively without any relation to the nation?—Yes.

10,554. If you have to choose between syndicalism, that is the ownership of the property by the men engaged in it, and the ownership of the property by the nation and controlled jointly with the men engaged in it, which would you prefer?—That would partly depend upon the terms upon which the thing was taken over. On the whole, I would prefer that if you are going to have the thing unified at all, it should be unified through the nation rather than through a private concern, whether consisting of the men or anybody else.

10,555. That would be a private firm syndicalised in that sense?—Yes.

Sir L. Chiozza Money: May I now ask one question?

23 April, 1919.]

PROFESSOR ARTHUR CECIL PIGOU.

[Continued.]

Chairman: Yes.

10,556. *Sir L. Chiozza Money:* With regard to a point put to you about the explosives, it was suggested to you that it was Government neglect before the War that failed to give us explosives. Are you aware that the real neglect was the neglect of nearly the whole commercial industries of this country by capitalism?—It depends on what you mean by "neglect."

10,557. You compared with Germany the system we had with regard to chemical industry in the alkali branches and one or two others?—Yes?

10,558. Is it not a fact it was capitalistic neglect that led to our loss of explosives, and is it not the fact those explosives were provided from the use of by-products of coal and other things?—We had a small chemical industry relative to Germany. It

does not follow it was blameworthy of these people. It might be more profitable to get them from Germany.

10,559. With regard to this, it is now acknowledged this is the key industry?—I am suspicious about key industries.

10,560. With regard to housing, it has been suggested that housing is a national industry. Is housing a form of national industry in this country?

Witness: If you mean built by the nation, no, certainly not.

Mr. R. H. Tawney: We have had some references to salaries on both sides of the table. Can we have a return with regard to those?

Chairman: Will you put on a piece of paper the returns you want, and I will see that they are got for you, if possible.

(The Witness withdrew.)

Mr. Leslie Scott: Might I ask for your ruling as to the most convenient time to make an application on behalf of the Mineral Royalty Owners?

Chairman: Immediately we have concluded the evidence of Sir William Ashley, if that suits you. Professor Ashley wants to get back to Birmingham.

SIR WILLIAM JAMES ASHLEY, called and sworn.

Chairman: The system we have is that I should read your evidence and then any gentleman of the Commission who desires to ask you questions can do so. Sir William James Ashley, you are Vice-Principal of the University of Birmingham and Professor of Commerce at the same University. Your evidence is as follows:—

MEMORANDUM ON THE NATIONALISATION OF THE COAL INDUSTRY.

1. In the absence of any personal experience or recent investigation of the conditions—technical, commercial and industrial—in the coal industry of Great Britain, or of information with regard to the coal industry of other countries (beyond that readily accessible in Walker's treatise on *Monopolistic Combinations in the German Coal Industry*, 1904, and the two volumes issued by the *Federal Trade Commission of the U.S.A.*, 1916), it is impossible to present anything that can be called evidence. All that can be done is to make a few general observations on the situation.

2. The primary question is whether or not the Coal Industry shall be placed under a control which shall substitute for "the present system of ownership and working" the pursuance of a single policy, enforced by a single supreme executive, with regard to each of its important aspects, including not only the getting and marketing of the coal, but also the remuneration of the several factors of production. The term "control," however, may easily be misleading, since by itself it may denote no more than the imposition from outside of certain restrictions, while leaving the present system in the main intact. What is now in question is the replacement of the present system by a single authority which shall have at least the powers of the directorate of an amalgamation. For convenience this may be spoken of as a "Single Authority" organisation. The constitution of this Single Authority—whether in various possible forms of what has come to be known as "Nationalisation," eliminating private capital, or in various possible forms of "Unification," retaining private capital—is logically, and in many vitally important respects practically, a secondary question.

3. It is evident that—however weighty may have been the arguments in favour of a Single Authority, based on the importance of the nation's fuel, the economy of large-scale undertakings and other considerations—the British coal industry, before the War, had not, in fact, reached, by internal evolution, a situation in which the imposition of a Single Authority had become relatively easy. There are some industries in which, by the mere operation of competitive commercial motives, the processes of amalgamation or combination have gone so far, and the business brought to so large an extent under direc-

tion from one or a few centres, that the completion of the development by the imposition of a Single Authority, whether by the State or by the dominating commercial forces themselves, becomes a comparatively simple thing, since most of the preliminary obstacles to unity have already been overcome. This was clearly not the case before the War with the British Coal Industry; so that, from the merely evolutionary point of view, it could not be described as ripe for the creation of a Single Authority. This is, of course, not a conclusive consideration, but it should be borne in mind when comparing the British with the German industry. In Germany, the output of the Ruhr district, which is about three-fifths of the whole, was controlled before the War to the extent of 88 per cent.* by one of the most successful combinations in the world—the Westphalian Coal Syndicate, which has been in existence since 1893. The second main source of supply, the Upper Silesian Field, has been in the hands of another, somewhat looser combination, the Upper Silesian Coal Convention, since 1890†; while the third main source of supply, the Saar field, was owned and managed by the Prussian State. The minor fields and the lignite or brown-coal industry are governed by similar cartels.

Combination has been facilitated in Germany, both by the geographical conditions, which give each of the chief fields a quasi-monopoly for a large contiguous territory, and by the historical conditions which have brought it about that the mining concerns are few in number and mostly large in size. Apparently there are no more than 85 concerns engaged in the Westphalian trade,‡ and 15 in the Silesian.§ Britain, with its approximately 1,500 separate concerns, presents a marked contrast. The twelve largest colliery companies in England and Wales mine between them, it appears, only between one-eleventh and one-twelfth of the total British output. In South Wales a notable effort was made by Lord Rhondda for several years before the War to bring about "community of interest"; but "the Cambrian Combine," in its widest sense, controlled less than one-sixth of the Welsh coal production and less than one-thirtieth of the total British production.|| And it is notorious that nothing

* Report of the Federal Trade Commission on Cooperation in American Export Trade, part II., p. 27.

† According to Walker, p. 112, to the extent of over 74 per cent. of the total production of the district and over 94 per cent. of the non-Governmental output.

‡ Federal Commission II. 29. It is not clear that this number does not include concerns outside the Ruhr district.

§ Walker, p. 112.

23 April, 1919.]

SIR WILLIAM JAMES ASHLEY.

[Continued.]

in the way of commercial combination between the several coalowners has ever been attempted beyond short-lived and commonly informal local understandings as to price, which has always broken down when put to a severe strain. It is generally understood that it was the absence of any effective unity among coalowners which compelled the Government to intervene against its will, both in the Minimum Wage Act of 1912 and in the Restriction of Prices Act of 1915.

4. It may, on the other hand, be observed that on the side of labour unity of policy and action has been achieved by the Miners' Federation of Great Britain.

And the establishment during the War of the office of Coal Controller has presumably created something like a central control alike of production and distribution. How far the compulsion of war has in fact anticipated the evolutionary process, created organs of supervision capable of becoming organs of administration, and accumulated experience with respect to the supply of industrial needs which can be utilised for post-war requirements—all this can only be judged by those who have worked through the evidence no doubt available.

5. It is unnecessary, however, in this Memorandum to carry further this line of argument, because, as the Note for the Information of Witnesses points out, "the Government, having adopted the Chairman's Interim Report, it may be assumed that the pre-war system of individual and uncontrolled ownership will not be re-established." The Interim Report has further decided that the alternative must be "either nationalisation or a method of unification." The Coal Industry Commission is, therefore, already committed to the establishment of a Single Authority, and it only remains to decide what that Authority shall be.

6. The real question now at issue is whether, in the constitution of the Authority, the present private ownership of the mines shall be retained, and the owners, accordingly, represented on the Authority, or whether the present property interests shall be purchased by the State and the reason for their representation on the Authority disappear. It will be convenient to designate these alternatives simply as Unification and Nationalisation.

7. The following are among the possible merits of Unification as compared with Nationalisation:—

- (1) It avoids the necessity for valuing the property interests, together with the large financial operations involved in national purchase.
- (2) It retains, in some measure, the influence of the existing motives of self-interest and "individual enterprise" on the part of the existing owners.
- (3) It does not directly involve the National Government in the difficulties and probable odium incident to the determination of the price to be charged, from time to time, to the industrial users of coal.
- (4) It does not directly involve the National Government in the difficulties, and probable international complications, incident to the regulation of the export of coal with respect to quantity, direction and price.

8. With regard to the preceding considerations, it may be observed:—

- (1) The weight to be attached to the first mentioned can only be estimated after detailed scrutiny of the situation. The terms of "expropriation" have apparently, so far, only been considered with any particularity by the advocates of Nationalisation; and it would obviously be improper to arrive at any settled conclusion until detailed calculations have been put forward both by coalowners and by independent accountants.
- (2) How far the self-interest of owners (as distinguished from salaried management) has in the past been effective in the public interest by enlarging or cheapening the supplies of coal can only be judged by those who have an intimate inside knowledge of

the industry or the advantage of expert evidence. Considerations of safety will doubtless continue to confine the actual "management" of mines to technically trained men; and it would not seem difficult to give them at least equally strong motives for efficiency under national as under private ownership. The only doubt is whether salaried officials, however highly placed, will be enterprising and courageous in undertaking large new operations. But it must be remarked that under any system of Unification the initiative of the capitalist as such tends in any case to be replaced by salaried directorship.

- (3) and (4) With regard to relations to other industries and other countries, it would seem pretty clear that the establishment of a Single Authority, not by spontaneous agreement within the trade, but by Parliamentary enactment, with the inevitable element of governmental supervision attending it, would, in the eyes of other industries and other countries, make the Government ultimately responsible for the Authority's decisions.

9. To bring the whole of the coal production of Great Britain under control, in the interest, on the one side, of economy of production, and, on the other, of the highest possible standards of comfort and safety for the miners, will be an enormous task. How great they are, when they have not gradually been overcome by internal competitive evolution, but remain in all their complexity to be dealt with by deliberate and all-embracing plan, does not seem to be realised in every quarter. Such as they are, however, they are the same for Unification as for Nationalisation. The Government, by the acceptance of the Chairman's Interim Report, involving in principle a Single Authority, has committed the country to undertake the task; and there seems no obvious reason to suppose that the retention in the Authority of the element of private capital will make it easier to secure success.

10. And, finally, Unification has the very great demerit of retaining the present apparent conflict of interests between coalowners and miners, and all the difficulties apparently inseparable in this industry from the adjustment of wages with proprietary interests. Any form of Unification which seems feasible involves "joint control." But a genuine Joint Control, in industry as in international affairs, has the disadvantage of weakening responsibility and giving occasion for mutual recrimination; and when one has regard to the general tendencies of modern life, Unification with Joint Control can hardly present itself as a stable solution of the problem.

11. The general conclusion would seem to be that, since a Single Authority has been decided upon, there is no very clear advantage to be obtained by a form of Unification which retains the present property interests and some obvious advantage to be secured by out-and-out Nationalisation.

12. If Nationalisation should be recommended, it would seem to be desirable that, in the form of control which is set up, the consumers should be definitely represented. Officials dependent upon an Authority on which the miners were represented might feel embarrassed in wage negotiations with the Miners' Federation, and controversies in the House of Commons between the group of Miners' Members and the Cotton or Steel or other industrial groups are to be avoided if possible. It would be well to give representatives of the consumers as such, if not a share in determining price, at any rate a regular opportunity of expressing their opinions with respect to proposed changes in price. The Co-operative organisations and the great municipalities (the latter perhaps by some system of rotation) might be regarded as sufficiently representing the domestic consumers, and the Federation of British Industries, the Association of Chambers of Commerce, and the Associations in the Cotton and Shipping trades would perhaps sufficiently represent industrial users.

23 April, 1919.]

SIR WILLIAM JAMES ASHLEY.

[Continued.]

10,561. *Mr. Sidney Webb*: I will only ask you a few questions. You point out that unification as compared with nationalisation avoids the necessity for valuing the property interests. I do not understand that. Would not unification involve a merger of the financial interests?—It would seem to depend upon the form of unification adopted. I think I must grant that any very complete unification would probably pretty soon at any rate involve the necessity for a valuation of the interests, but not the necessity involved in the actual purchase of them.

10,562. That is true. There would have to be an issue, to put it in the concrete, of the new stock in the Unified Authority in exchange for the existing stock of the separate companies?—Yes.

10,563. Would not that be almost identical in its effect on the money market with the issue of Government Stock in exchange for the existing companies stock?—I should like to consider that. I have not considered the question of the form which the capitalisation would take.

10,564. That is not a point of very great importance. You point out that unification without nationalisation would have the advantage of not directly involving the National Government in the probable odium of fixing the price of coal. I ask upon that whether you contemplate a unification which would have power to put the price of coal at what it chose?—I do not contemplate any particular form of unification; but such a unification as has been reached in Westphalia does have the power of fixing the price of coal and there arose considerable odium.

10,565. That of course is the case. We have not hitherto had it suggested to us that it would be possible to set up in this country a unified trust without Government control over its price. Do you think it is practically possible to set up a unification of the coal industry without safeguarding the public interest by a very effective control of the maximum price?—That is not really a question of economics at all.

10,566. That is a question of politics. If the price is to be fixed by the Government and controlled by the Government under one form as well as the other the special advantage of the Government avoiding the odium would no longer accrue?—Under sub-paragraphs 3 and 4 of paragraph 8 I have pointed out that it is not a question of contrast between no Government odium and Government odium but that it is simply a matter of degree, and that any form of single authority established by Parliament would practically involve a Governmental responsibility.

10,567. I am anxious to bring that out. It did not leap to the eye at first sight. It seemed to me a contradiction. Under paragraph 9 you point out that the organisation of the industry under the one form as under the other will be a very considerable task; it will involve a survey of the whole thing and a fitting in of the different units and so on. Then you say: "There seems no obvious reason to suppose that the retention in the authority of the element of private capital will make it easier to secure success." Is not that rather under-stated? Is it not obvious the interests of separate capital interests would make it much more difficult to organise?—I was assuming a degree of single control, a power on the part of a single authority to start with, which would be free from those limitations of the private interests involved.

10,568. That is to say a complete autocracy as far as the capital interests are concerned?—Yes.

10,569. If you have that capitalised autocracy the effect will be felt on the rest of the community?—Yes.

10,570. You point out under paragraph 8 (2) that as regards enterprises we have to depend upon salaried officials in every large enterprise. You mean under joint stock companies, and under great Trusts the management is more or less tending to pass into the hands of salaried persons?—That is the case. I wanted to express myself with caution there. I did not know to what extent in the coal industry, the owners, as distinguished from salaried managers, had in fact developed the industry. One can imagine in

the earlier stages of the industry they did a great deal, but as to the state of things before the war I am ignorant.

10,571. To a certain extent it is a matter of a new generation. The property passes to the families and it is always tending to pass out of the hands of the actual administrator?—That is the tendency certainly.

10,572. You make a suggestion about consumers' representation. I was wondering whether the Government was not the representative of the consumer as a whole?—Yes, I know it is in theory, and I realise the strength of that argument, but it depends in practice whether you mean by the Government the officials or you mean Parliament. If you mean the officials, I am not sure that the ordinary bureaucratic tendency towards not creating trouble and taking things easily and so forth, and also, in some cases, the desire for promotion might not cause them to be less keen about consumers' interest than you otherwise might desire. If you mean Parliament, it seems to me undesirable that on the floor of the House there should be a set-to between groups representing the several industrial interests, and therefore, as a matter of practical expediency, I should have thought it desirable to, in some way, have the consumers represented as such.

10,573. I am in entire agreement. I am anxious to bring out the suggestion that this or that municipalities should be accepted as representatives of the domestic consumer?—Yes.

10,574. You see the difficulty of putting all these persons, or any sufficient quantity of them, in a single executive council. I think your suggestion would cover also a separate consumers' council, for instance, which would have the right to be consulted?—Yes.

10,575. *Mr. R. H. Tawney*: In para. 8 (2) of your evidence you discuss certain administrative questions. I gather you think the question of efficiency of administration under a public system really depends on the kind of men you get and the kind of conditions upon which you employ them?—Yes.

10,576. It has been put, I think, several times, and that is the crux of the matter, that in the first place you will not get able men who are able to run the business to undertake the position in a State concern. Can you tell us whether that is so? You have had a lot of experience in that kind of thing?—I should not like to generalise, and with regard to the coal industry I have no special information, but, so far as business management is concerned, I am alternately struck with the great ability of a comparatively few men led by the ordinary business motives (which are not purely financial) and the low degree of ability of a very large number of those who at present are in actual control of businesses.

10,577. Might I put it in this way? Even at the present time, with all its deficiencies, the public service does draw on a body of men who are very distinguished intellectually, and whilst it is suggested the public service does not offer the same prizes as industry provides, do you think that fact is quite conclusive? Business men after all work for other motives as well as for profit. They have a constructive gift often, and might not that kind of motive be more generally appealed to?—Yes, but here again it is dangerous to commit one's self to very general statements or expressions of opinion. I think, to begin with, that the motive of public service is a very powerful motive, and one which could be more appealed to, and I think our Civil Service illustrates that, because at the top of the Civil Service you certainly very often get a degree of ability which is remunerated by other advantages, other sources of satisfaction than the mere salary. How far that motive with the present education can be counted upon to spread down I should not like to say. I think that among what people call the working classes, there are a considerable number and an increasing number of men to whom the feeling of working for the public interest is a real stimulus, and one would hope that in futuro that number will increase, but I should not be very sanguine as to the actual strength of that motive upon the great mass of men

23 April, 1919.]

SIR WILLIAM JAMES ASHLEY.

[Continued.]

in an industry. I should like to add with regard to the other thing you asked me, that I think although in private industry there are opportunities for pecuniary advancement which are greater than in perhaps a large part of the State service, yet one of the great difficulties of English business, I think, is the inadequate opportunities for young men of ability to make themselves felt and to get commensurate positions—that is to say, comparing England with America, I think a young enterprising man in most businesses has a more attractive future before him in America than he has in England.

10,578. That, of course, is a very relevant fact, when considering the relative efficiency of public and private officials. It has been suggested that one of the difficulties is the appointment of persons on other grounds than that of efficiency. Would it not be true to say in private industry there is great nepotism, and the difference between private and public industry is in this respect, that in public industries it is noticed, whereas, of course, in private industries it is not. Is it not the case that sons succeed fathers in the administration of their fathers' business though they may be singularly unfit for any administrative position?—I think what you say is largely true. I should avoid the use of the term "nepotism."

10,579. It was a convenient word, that was all. I do not attach any importance to it. Public administration has been criticised, and it has been said that you might have excessive centralisation, everything run from Whitehall. Is that necessary? You could decentralise a public coal service in exactly the same way as you can decentralise a private coal service. Again, it is an administrative problem?—If you mean by "private" subject to a unification which retains private property, there is no difference between "public" and "private" in this respect.

(The witness withdrew.)

Mr. Leslie Scott: I have to appeal to the Commission for leave for the royalty owners to be represented by counsel. I appear on behalf of two-thirds of the royalty owners of the United Kingdom, measured in rent. The suggestion which I make to the Commission, knowing the extreme importance of saving every minute of time—(*Chairman:* That is quite true)—is that I should be permitted to examine those witnesses that the Commission think fit to allow to be called to express the views of the royalty owners, and to be allowed to cross-examine within certain limits that you might lay down, where issues affecting the royalty owners are concerned, and, at the end of all the proceedings, to make a short address, say limited to two hours, on any matter that may affect royalty owners.

Chairman: Do you mean at the end of the case for the royalty owners or the end of these proceedings?

Mr. Leslie Scott: At the end of the proceedings with regard to this portion of your report, so that I can comment on the different views that have been put forward. I think I can be of most use to the Commission at that stage.

Chairman: With regard to examining the witnesses, what might be done to meet the wishes of your clients is that their proofs should be read. You appear for them. You cannot do it better than have the proofs read.

Mr. Leslie Scott: I observe the procedure of the Commission.

Chairman: You will be here to protect the witness if he wants protection.

Mr. Leslie Scott: I am entirely in the hands of the Commission with regard to that. It is really, I think, more for the purpose of putting one or two questions in re-examination that the right is important. I do not think I should seek to ask any questions in examination in chief. The practice of reading the proof seems to be the most convenient.

Chairman: With regard to your making a speech you would not want to make that until after some weeks or days, or at the end of the proceedings.

Mr. Leslie Scott: Yes.

Chairman: The Commission will meet in private to-morrow at half-past ten, and we shall be sitting here at 2 o'clock. We will announce our decision to-morrow. You need not personally trouble to be here, Mr. Leslie Scott, unless you have nothing better to do. We do not intend taking your witnesses until Friday.

Mr. Leslie Scott: There is another matter which I want to raise with regard to the prints of the evidence. There are two or three points that are suggested to me. One is that we might have copies of the tables put in by the witnesses. The evidence already given is difficult to follow without having copies of the tables.

Chairman: If you will let me know which tables you want, I will do my best to let you have them. I do not know if we have spare copies, but, if not, you shall have my own. I have given Mr. Pawsey already my own copy of the evidence.

Mr. Leslie Scott: May we have further copies of the evidence, in order that the witnesses we put before you may know what has been said before they give their evidence? Again, with the object of shortening their evidence, or, if there is not a sufficient supply, may we have the copy we have already been furnished with reprinted?

Chairman: I do not think there is any objection to that. It will not be an authorised reprint. We cannot give you any further copies, for one very good reason, there are not any. I have already given Mr. Pawsey my copy, which you are at perfect liberty to reprint. They will be reprinted not as Government reprints, but for your private education.

Mr. Leslie Scott: For the future, might extra copies be printed, so that day by day 20 copies can be supplied to us?

Chairman: I will endeavour to get that done; it is a reasonable request. You understand the copies you have are not copies revised by the gentlemen who have given evidence. The reason there has been some delay is we have sent to each witness a print of his evidence in order that he might correct the mistakes, if any, and then a proper draft is printed.

Mr. Leslie Scott: I observe that the proofs of the evidence to be given by the witnesses are printed and are available when the witness goes into the witness chair. Could a sufficient number be printed to supply us at the time the witness takes the chair with, say, 20 copies? Might I make a suggestion also that a sufficient number of copies of the witnesses' proofs be supplied to the Press at the time the witness goes into the chair? I think it would be for the convenience of everybody if that could be done.

Chairman: As far as the Press are concerned your application has already been acceded to. We have always given the Press not to-day but from the very beginning a copy of everything. We will certainly endeavour to give your clients copies. We will have more printed.

Mr. Leslie Scott: Will you be taking witnesses for the royalty owners on Friday or not?

Chairman: It very much depends upon how far the members of the Commission are tempted to cross-examine the witnesses who will be called to-morrow. I think I can assure you we shall take some witnesses for the royalty owners on Friday.

Mr. Leslie Scott: Then could you see your way not to take any witnesses for the royalty owners on Tuesday but continue them on Wednesday? I will give you the reason. I am Chairman, as you know, of another Committee dealing with mining matters. We are sitting on Monday and Tuesday, and we hope to give our final report on Tuesday. That may be of some use to this Commission.

Chairman: We will not take royalty witnesses on Tuesday. There will certainly be some taken on Friday, I hope, and we shall resume them on Wednesday.

Mr. Leslie Scott: If you please, Sir.

(Adjourned to to-morrow at 2 o'clock.)

SECOND STAGE—SECOND DAY.

THURSDAY, 24TH APRIL, 1919.

PRESENT :

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. ROBERT SMILLIE.

MR. R. W. COOPER.

SIR ALLAN M. SMITH.

SIR ARTHUR DUCKHAM.

MR. HERBERT SMITH.

MR. J. T. FORGIE.

MR. R. H. TAWNEY.

MR. FRANK HODGES.

MR. SIDNEY WEBB.

SIR LEO CHIOZZA MONEY.

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE (*Assessor*).MR. ARNOLD D. McNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

Chairman: Gentlemen, I have an announcement to make to the members and the public with regard to the date by which the next Interim Report will be produced. At the conclusion of our first sittings I had the honour of seeing Mr. Bonar Law for a short time, and he asked me how long I thought it would be before we could produce our second report. After considering the matter, I thought that we might do so in two months, and it was because of that that I said to Mr. Bonar Law that we hoped, barring accidents, to produce our next report by May 20th, which was two months from March 20th. The Miners' Federation of Great Britain felt themselves, quite properly, if I may be allowed to express my opinion, in a position where they ought to consult their constituents, and they resolved to have a ballot. That ballot was taken with very great care after due deliberation, and a very great number of men voted at it. I had hoped when I gave Mr. Bonar Law my undertaking to publish the next report by May 20th that the Commission would be sitting within a day or two. As it turned out we were not able to sit for a month. We adjourned on March 20th, and we were not able to sit again publicly until yesterday, April 23rd. I have consulted the members of the Commission this morning, because I was personally quite prepared, and they too were quite prepared, to publish our next report by May 20th, but it meant this—it meant, having regard to the number of witnesses we should have to call, sitting at least 10 hours a day for six days a week. If we did that, I am afraid many of my colleagues before May 20th would be appearing upon the list of distinguished invalids, and we should not be able to produce our report for physical reasons. Another consideration which weighed with us was that on both sides of the table there are gentlemen who have their private business to attend to and who cannot be expected to work 10 hours a day for six days a week without getting to their business or their home in the country even for a week-end. So we have decided to sit four days a week; namely, Tuesdays, 10.30 to 4.30, Wednesdays, 11 to 5, Thursdays, 10.30 to 4.30, and Fridays, 10.30 to 4. That enables the Commissioners, who, after all, are giving their services on this Commission to the country gratuitously, to get Saturday and Monday to attend to their private business, but it makes it quite impossible to produce the report by May 20th. I am satisfied the Government and the country

under those circumstances would not desire us to do it. The subject is of such vast importance that it is not right that we should work for such a number of hours each day as not to be able to give proper attention to the matter. Under those circumstances we have resolved—and the resolution I desire expressly to say has been come to unanimously—that the report will be presented not later than June 20th, and that gives us the time that I originally had in my mind when I told Mr. Bonar Law that we could do it in two months—May 20th being the date on which the two months would expire, of course, after the date of our last meetings.

We shall now proceed to call evidence, but before doing that I have to give an answer to Mr. Leslie Scott, who made an application yesterday that Counsel should be heard. The Commission have very carefully considered the application at their private meeting this morning, and they have come to this conclusion. At a former stage of the enquiry there were interests who appeared before us who had no representative separately upon the Commission itself. We were not able in our discretion to grant them representation. We felt, too, that there are a large number of other interests beyond those of the royalty owners—to take a short example, distributors, or the factors—who are not directly represented upon the Commission, who, if we acceded to the present application, would be entitled to say that they too must be allowed to have Counsel. Under those circumstances we have come to the determination that we cannot allow Counsel to appear, but we shall do this:—Proofs of the witnesses can be handed in, and I, or some member of the Commission, will read the whole of the proof verbatim, and therefore the whole of the evidence that any party desires to place before the Commission will be not only before the Commission, but will be read publicly. We do not think we can allow cross-examination, and we do not think we can allow re-examination. Up till now I have, except in one or two instances, refrained personally from asking any questions. I have purposely, however, asked certain questions of gentlemen who appeared for an interest which was not represented upon the Commission, in order that their case should not be neglected. The Commission have asked me to do this, and I purpose to do it and am willing to do it; I myself will conduct any re-examination of any witness who is called. The

24 April, 1919.]

[Continued.]

position therefore will be this. The whole of the evidence will be read out, every word of it, publicly. The members of the Commission themselves will ask any question which they desire to ask in cross-examination, and, if I think it is necessary, I will myself re-examine any witness on any point which I think ought to be brought out or of which in my judgment they have given a confused account. With regard to the speeches of Counsel, what we propose to do is this. Counsel will be good enough to send us their speeches either typewritten or printed, and we will read them. If I may be allowed to say so, in some ways that will put Counsel in even a better position, because the members of the Commission, instead of relying upon notes they make of Counsel's speeches, and the memory they may have of Counsel's speeches before them in print, and those speeches will be read. So that we shall have (1) the sworn evidence, and (2) Counsel's arguments in the way I have described, if they like to address them to us. Those speeches by Counsel will be placed at the end of the evidence, so that they will appear as part of the proceedings. Therefore, in one way, there will be a more permanent record of Counsel's speeches than there would be if they merely uttered them verbally and members of the Commission made notes of them for their own assistance.

That, Mr. Leslie Scott, is the determination which we have arrived at, and which we must adhere to.

Mr. Leslie Scott: Sir, before the witness is called, may I ask whether the submission which I respectfully made on behalf of the Committee in writing this morning, has been laid before the Commission,

Professor EDWIN CANNAN, Affirmed and Examined.

10,580. *Chairman:* I believe you are a Professor of Political Economy in the University of London (London School of Economics) and author of various works on economic subjects?—Yes.

10,581. I have had the pleasure of reading your report, and I do not think it is necessary to read now the whole of it, but there are some parts of it which I am most desirous that the Commission and the public should hear and appreciate, and I will read out those parts which appear to me to be most useful to us. You say, first of all: "I have known few miners and fewer coal-owners, and have never lived in a coal district, nor even been down a coal-mine. I have never owned royalties or wayleaves or ungotten minerals, nor held shares in a colliery undertaking, having, perhaps unfortunately, been brought up to regard such things as unduly risky."

Then you go on to state that you have not any practical experience of it, and then in your fifth paragraph you say: "I have never seen any statement about the size or shape of mineral properties in this country, and such of the evidence as I have read does not seem very conclusive on the question whether they are such as to cause much obstruction: if they are, I should say appropriate the owners or rearrange the properties wherever this is the case. If not, it is not worth while, as expropriation itself must cost something. I don't think that more rapid discovery and development of new sources would be a recommendation if it could be proved probable, as I doubt the desirability of accelerating the exhaustion of the coal."

The same considerations apply to way-leaves. The importance of the actual charge imposed as way-leave is often exaggerated, owing to neglect to notice that it is all the same, whether payment for mineral extracted is paid to the owner of the surface under which the mineral is found or to the owner of neighbouring surface over which the mineral must be carried; if more is paid as way-leave, there will be less left for royalty. But the more interests there are to be satisfied, the more difficult it is to get on,

and whether that application will be incorporated in the record? You will remember the two letters I had the honour to submit to you this morning.

Chairman: The letters you were good enough to send me reached me at No. 2 Queen Anne's Gate Buildings, where we were having our meeting, and I opened them and read them out aloud to the members of the Commission.

Mr. Leslie Scott: I should be glad if they could be incorporated in the record.

Chairman: I will consult my colleagues with regard to that, and let you know.

Mr. Leslie Scott: I understand that the request in the second of the two letters, that Counsel might be permitted to appear on behalf of both royalty owners and the colliery owners jointly, is acceded to within the limitations indicated by you.

Chairman: Counsel are entitled to send in their speeches, as I say. I should like to say, if I may, that I think those speeches will be very helpful, so that I hope Counsel, if they find themselves at liberty to do so, will not think themselves circumscribed in any way. The arguments will be of great assistance, not only to me personally, but to each member of the Commission.

Mr. Leslie Scott: But there will be no cross-examination of the witnesses under any circumstances.

Chairman: No, that is not quite accurate. There will be twelve cross-examinations of every witness.

Mr. Leslie Scott: I apologise—I meant, of course, by Counsel.

Chairman: Yes, no cross-examination by Counsel.

and in case of any minute sub-division of surface ownership, way-leaves would be likely to stifle mining enterprise altogether if each owner and long lessee could hold out for what he liked. I see no reason why way-leaves should not be obtainable compulsorily on the same principle as land required for an ordinary authorised railway, but, of course, by some less cumbersome and expensive process.

To whom royalties or other payments representing the value of the mineral before it is touched should go, seems to be practically an unimportant question. The amount does not appear to be large to start with. It is reduced by 1s. in the £ by the mineral rights duty, and as most of it notoriously belongs to wealthy owners paying high and continually rising rates of income-tax and super-tax, about half of it is likely to go to the Exchequer now or in the immediate future, and more later on. Of the remainder, doubtless much more than half will be invested by the owners in providing new capital for industries, the proportion being high, not only because they are wealthy, but also because they regard the receipt not as permanent income but as a wasting income, which must terminate in measurable time. As a matter of general principle, however, whatever the sum is, it should be maintained as a surplus over cost of production, and not frittered away in working mines which are below the level of profitable exploitation. To apply the surplus gained on the fertile mines as a subsidy for working some which it is not really worth the community's while to work would be like applying the rents of lands in Middlesex to growing corn on the top of Ben Nevis or reclaiming the Goodwin Sands." Then later on in your proof you address yourself to this question: (1) Would nationalisation benefit the taxpayer? and you say: "The answer to this is most obviously in the negative. One of the principal objects of the advocates of nationalisation is to get rid of certain profits which, on the average, pay high rates of taxation in income tax, super-tax and death duties. With the disappearance of these profits the taxation levied from them will disappear also. If it be objected that the State will then get, not the percentage now levied in

24 April, 1919.]

PROFESSOR EDWIN CANNAN.

[Continued.]

taxation but the whole, the answer is "It will not get a penny." Everyone knows how extraordinarily difficult it is for a State or even a municipal enterprise to get itself allowed to make even that low rate of profit which must be got in good years in order to cover the losses of bad years, to say nothing of anything over and above. As soon as profit appears, the consumers clamour for lower prices, and the producing employes for higher remuneration; the advocates of the State or municipal enterprise side with one or the other, and its opponents are secretly pleased that it should not look prosperous judged by the ordinary standards; in the end the authority, unless peculiarly strong, as that of Prussia used to be, almost invariably gives way." I need not trouble with the remainder of that, because that is the gist of your argument on (1). Then the next question is: (2) Would nationalisation benefit the consumers of coal?—and you say: "Here again the answer, I think, is an unhesitating negative. I do not profess to know much about the subject, but I cannot believe that the finding of coal deep below the surface, the sinking of shafts at the right places and driving of galleries in the right directions, and all the other things which are required to initiate a mine are very easy matters to arrange for. Even the subsequent working must often present problems of considerable difficulty. And the distribution of the produce, some of which may be consumed in the miner's house close by and some in a ship or a factory thousands of miles away, seems to be not altogether plain sailing; 'let each colliery and coalfield supply the places nearest to it' sounds easy till you reflect that it is possible for variations in the supply and demand, both temporary and permanent, to occur, that different consumers require different sorts of coal, and all kinds of other complications with regard to size, time, and method of delivery. To suppose that all this could be well done by the Government of the United Kingdom because that Government has long managed with some success to collect letters from receptacles in which they are placed by their writers, take them to an office, sort them out, dispatch them to other offices, and thence deliver them to the houses to which they are addressed, seems to me very absurd. In difficulty the post business is child's play compared with the coal trade, and, after all, it is not so very well done. Till lately it was sure, and probably will soon be so again, but it is generally slow, and the charge of a penny for a letter, though it looked cheap in 1840, did not look so in 1900, compared with many charges of a penny for other things. At first, when it took over this coal business, the State would no doubt take into its service a large number of those now engaged in it. Probably that number would not include many of the ablest. Some of these, in middle life or beyond, having secured sufficient to live on in comfort or luxury, would retire into private life; others, young and ambitious, would filter away to more promising fields than Government employment. Gradually the staff first secured would die out, and the Ministry of Mines with its subordinate district offices would sink into an ordinary bureaucracy with all the usual characteristics, and totally incapable of managing a business like the coal trade with any tolerable satisfaction to the consumers." I need not read any more about that. Then the next question is (3): Would nationalisation benefit the miners?—and you say: "No one doubts that during the war persons engaged in Government service connected with the war, with the exception of the army and navy, were in clover compared to others in all the belligerent countries. But the means to pay them were then provided by borrowing, stimulated and assisted by watering the currencies, a method which cannot endure for any long time." Then you say: "But as the field of employment by the State enlarges, the policy of favouring those employed by the State at the expense of the consumer becomes more and more difficult, and at last impossible. Industries cannot all be favoured by subsidising each other. A subsidised telegraph system can be supported with ease, but it does not follow that a subsidised railway and canal system, a

subsidised mining system, and so on, can be added without ever-increasing difficulty. And the project of making everyone well-off by the process of writing up the value of the services rendered by everyone to everyone else is just as illusory as the project of making everyone the recipient of the proceeds of the taxation of everyone.

So, and especially if the railways are nationalised, as seems likely, the nationalised miners are not well-advised if they expect to enjoy a specially-favoured position such as State employees are supposed to have enjoyed in pre-war days. They are likely to retain almost their present place in the scale of occupations. They will not be much pushed down, because if in wages, hours and disagreeable incidents, taken together, mining came to compare much worse with other industries than it does, it would become impossible to get recruits for the work, even if men already engaged to the work did not abandon it either singly or in combination." I do not think I need read further until I come to some important observations which are as follows: "If nationalisation is to be rejected what thence?"

It is not I, but the Commission and the Government which has apparently decided that 'something must be done' before finding out whether they knew of any remedy better than the disease. But if I am told that it is certainly determined to do something, and that though I know almost nothing about the coal trade and have not had time to get it up, I may just as well give any suggestion that occurs to me for what it is worth, leaving the Commission to do what they can with it, and remembering that even ridiculous proposals sometimes lead to something better by bringing out some unthought of aspect of the case, I venture the following:—

In the first place satisfy, as far as may be, the desire, so ably expressed by Mr. Straker, of the miners for knowledge of the manner in which the industry is conducted. It is high time we dropped the notion that trade is a kind of war in which everything must be kept secret for fear of information being conveyed to the enemy: it ought to be regarded as co-operation between friends, none the less friendly because they bargain or even haggle. Most certainly provide for the periodical publication of the accounts of all colliery-owners, properly audited, and in such form as will satisfy the miners' representatives that they are getting a true account.

As soon as this has got into sufficiently good order to enable the profits of each company or individual to be ascertained shortly after the termination of the year or half-year, let some definite percentage be paid from these profits into a common fund, which shall forthwith be divided among the miners who have been employed during the year or half-year in proportion to the amount of wages earned by each of them in that period.

It will be said that the benefit derived from the 'miner's dividend,' as it might be called, would be very like that derived from the working of the sliding scale—the miners would get more in good years and less in bad ones. The intention is the same, but the proposed method seems to carry it out better." I do not think I need trouble with the next paragraph, but you finally deal with the objection by saying: "Lastly, it will be objected—by some, and perhaps observed with pleasure by others—that the proposal is the thin end of syndicalism. It may be said that the publicity of accounts and the necessary participation of the miners in order to ensure their correctness will lead to the miners' organisation in a very few years getting to know a great deal more about the trade than it does at present: that, no matter if the dividend starts at quite a low percentage, more will soon be demanded and have to be granted: that as the miners' organisation acquires more knowledge and the proportion of the miners' dividend to the whole increases, the miners will get more and more into the saddle, until at last capitalist management is altogether pushed out, existing capital rented, and

24 April, 1919.]

PROFESSOR EDWIN CANNAN.

[Continued.]

future necessary capital provided out of profits or borrowed by the Syndicate at a fixed rate of interest: and finally, that the organisation, not being in any way a State organisation, might spread and take in the Belgian, the French, or even the Westphalian miners.

Something of that kind might well be the course of events. It does not seem to me very alarming, "bourgeois economist" though I am. It involves no sudden revolution such as is invariably followed by reaction: its difficulties would be met one by one, not in overwhelming battalions. Details we cannot expect to foresee, but of one thing we may be perfectly sure, and that is that the economic organisation of the 19th and early 20th century will not endure for ever, but will gradually be replaced by something else more suitable, not for the 19th century but for its own day and generation. Some such arrangement as I have suggested in which free associations of free men, able to go out and come in as each pleased, would voluntarily give service for service, irrespective of domicile and nationality, seems to me far more probable and far more desirable than any restoration of the feudal system basing economic organisation on the territory of the lord, even if the personal lord of the Middle Ages is replaced by a parliament elected by universal suffrage and proportional representation.

Monopoly such a Miners' Syndicate would certainly have—as indeed the Miners' Federation has at the present time—but I do not think it would be, or appear to be, the interest of the members to make coal scarce and dear, nor that the Syndicate would be half as likely to make it so by mere blundering as a Ministry of Mines, even if that Ministry took in and assimilated (as it would) representatives of every side of the industry as now constituted.

10,582. *Mr. Sidney Webb*: I have only a very few questions to ask you, because time is so scarce. I see that you do not in your suggestions make any reference to the more economical use of the national resources, especially coal?—No, I do not think they would be more economically used.

10,583. At the present time the private interests of the mineowners are to work the coal in the way which will yield the largest profit for the moment, or at any rate for the period of their lease, irrespective of the future. Is that not a defect?—Well, I think the proprietors of the minerals can enforce control, and they ought to protect themselves against that in their leases.

10,584. Do you think they do?—I expect they do.

10,585. We have had evidence that the mines are being worked in the interests of the largest profits and not in the interests of the wisest disposal of the mass of the coal?—I have not seen the evidence.

10,586. Turning to another point, you speak all through your proof, so to speak, in terms of money profits. Have you considered what influence that may have upon the occurrence of accidents?—I do not see why it should cause accidents to occur. I should have thought accidents were expensive.

10,587. Supposing it were found by experience that it costs less to provide workmen's compensation for accidents, or the insurance premiums covering it, than to prevent the accidents, and accepting that hypothesis for the moment, you might have the interests of the coalowners in conflict with the interests of the workmen?—Well, I should ask the Miners' Federation to look after that.

10,588. It may be the Miners' Federation are trying to look after that by asking for a change in the management?—Possibly.

10,589. There is nothing at any rate in your statement which bears on that possibility?—I do not see any difficulty about preventing accidents being profitable, if they are profitable, which I very much doubt—but I am not a coalowner.

10,590. With regard to profit-sharing, you point out that one of the good effects of trade unionism is to provide that workmen should get equality of pay and other advantages for the same work?—Yes.

10,591. Is not profit-sharing for the whole trade rather inconsistent with that: I mean, though the workmen in one particular year may be on a level, you would be making a great difference between the return to the workmen in different years?—I do not see how that can be avoided. The return to the labour of the community is different in different years. The labourer has to share in the general ups-and-downs somehow; he cannot contract out of it.

10,592. Do you think it is an advantage that he should share in the ups-and-downs to that extent?—He must; he cannot help it.

10,593. It is conceivable, is it not, that the capitalists may, in consideration of their profits, themselves bear the ups-and-downs and act as a sort of buffer, for instance?—They do to some extent, but they cannot possibly do the whole thing. That is the mistake made at present, that everyone thinks someone else is to bear the loss at the present time.

10,594. Can you not imagine that by a system of insurance it might be done?—No, I cannot. I think when the product varies downward people will have to suffer from the product being lowered.

10,595. At any rate, you do not regard it as any drawback, that you would introduce the workman to this, so to speak, gambling element?—I do not think it is a gambling element, but a matter of Nature. I think it is very desirable that the workman should be introduced to it, and that he should take some interest in the ups-and-downs of things.

10,596. I do not understand quite what you mean by "Nature" in that connection. The profits of the coal mines from year to year do not vary because of the difference in the harvest, as in agriculture, for instance, but the profits vary perhaps by some effect upon price, which in a sense is not natural?—But, surely, it is the harvest and other things which affect the price and cause the profits from coal to vary.

10,597. May not the prices vary because, let us say, of the superior bargaining of one party as compared with another, or the exigencies of Italy and the neutral States at this moment?—I do not think the powers of bargaining vary very much from year to year.

10,598. But the exigencies of other countries vary from year to year?—That depends upon natural causes, when it does not depend upon something worse like war.

10,599. That is to say, it depends upon natural causes. To come back to the profit-sharing, you do not see any disadvantage in the workman's livelihood going up and down in the way that has been suggested?—It would not depend entirely upon it, of course.

10,600. Then, I see, that you quite contemplate that mining will almost certainly eventuate into some sort of a monopoly in one way or another, but you contemplate if it is in the hands of the workmen themselves there would not be the same disadvantage as if it is in the hands of the Government. Is not that the meaning of your last paragraph?—Yes. I think there is not so much danger in monopoly in the hands of the people who provide the work as there is in a monopoly in other hands.

10,601. You think the consumer would be safer if all the coal were in the hands of the Miners' Federation than in the hands of an elected Government?—Yes, provided the Miners' Federation had an interest in the long-run yield of the whole business.

10,602. Is it not rather difficult to give any voting generation of men an interest in the long-run yield?—What I thought about it was this—that the people employed have an interest in providing employment for themselves and possibly also for their children,

24 April, 1919.]

PROFESSOR EDWIN CANNAN.

[Continued.]

and, consequently, they are not very likely to adopt a restrictive policy of trying to keep down the output, because keeping down the output by a restrictive policy means restriction of employment. I think that is universal experience. If you have an independent producer you do not often find him holding up his product and find him refusing to work a reasonable number of hours a day or only two hours a day so as to raise the price of his product. He likes to give himself full employment, and finds that pays best.

10,603. I have heard it suggested that such combinations in the past have tended to restrict numbers with a view to securing that employment and, consequently, to reduce the quantity?—My recollection of what is contained in "Industrial Democracy" or other works by the same authors, is that that was rather shown to be not a very considerable danger.

10,604. It was shown to be a tendency which was passing away, because it was not suggested that the miners or anyone else should be put into possession of the mines, but supposing the miners were put into possession of the mines is there any reason to suppose they might find an interest in making coal dear?—I do not think they would, as a matter of fact. I came to the conclusion, after considering this matter for some time—and I am inclined to stick to it—that it is not very likely. My scheme, of course, is a gradual scheme, and, if you saw that danger approaching, some method might be taken to meet it.

10,605. You count on a gradual increase of economic knowledge amongst the miners while it is going on?—I think that is probable, and I think the fact of receiving income from the profits of the mines would be educative in itself.

10,606. *Mr. R. H. Tawney*: I have only a very few questions to ask you. I notice you say you think nationalisation would not benefit the consumers of coal. Have you considered the distributive side of the coal industry?—Yes, I have considered the distributive side, and we all have lately.

10,607. You know the price of coal is fixed?—I do not find my price of coal is fixed.

10,608. But you know it is fixed by a Public Authority?—At present?

10,609. Yes?—Yes, I know it is fixed at present.

10,610. Are you aware that that price is sufficient to enable the co-operative societies of coal to distribute to their members something between 2s. and 4s. per ton (I mean societies engaged in coal distribution) while it is alleged only to leave merchants and factors a living profit?—I really do not know about that. All I know is that I used to deal with the co-operative society and I gave it up because the private merchant served me so much better.

10,611. Assuming that is the case, and that we have had evidence to that effect, does not that suggest that a co-operative method of distribution is responsible for certain economic advantages, even although you may not like your particular society?—I should doubt if it was the case.

10,612. You would doubt if what was the case?—What you say has been shown in evidence.

10,613. Have you read the evidence?—I have not had the opportunity.

10,614. You say you doubt if it is the case. Have you any reason for doubting it?—Well, I do not accept everything that Commissioners suggest in leading questions.

10,615. I will not make the obvious retort.—Oh, please do.

10,616. You may take it from me it has been given in evidence, and I understand the evidence, such as it was, was not disputed. I ask you only the hypothetical question: Supposing it to have been the case, do you not think it suggests certain financial economies?—It does not prove that the State will do it better.

10,617. No, it does not?—Of course, you can say any system is wasteful.

10,618. It suggests one system is more wasteful and another is less wasteful?—All it suggests is that the co-operative system is less wasteful. That system is open to everyone, I submit, and they may well continue in it, unless they have the same experience as I have had.

10,619. Now may I take you to the end of your proof? You make certain attractive suggestions, and I understand the first of them to be publicity. Could you develop that a little more? Do you mean publicity with regard to profit?—Yes, certainly, I meant publicity with regard to the whole of the accounts: that you should publish the accounts in a way that the accounts are quite open, just as those of many statutory companies are public, and make them available to anyone and give the miners the power of seeing that they are all right.

10,620. You think in fact it is of great importance that there should be complete publicity in industry?—Yes.

10,621. Would you add to that publicity with regard to costs when that is possible?—Certainly.

10,622. That is to say, there would be publicity with regard to costs and profits. Have you any suggestion to make as to how that may be brought about? Would the publication of a balance sheet by a limited company quite realise the thing you have in view?—No, there would have to be, of course, auditors, as I suggest, appointed by the miners' representatives and, possibly, by some representative of the consumers or the Government.

10,623. That is to say, it really involves a public audit, does it not?—Yes.

10,624. And you think one of the first conditions of importance which you give is that there should be a public audit which would establish complete publicity with regard to costs and profits. That is the case, is it not?—Yes. I think, whatever you do, that is desirable.

10,625. I was very much interested in the last paragraph of your proof. Am I right in thinking that you are in favour of syndicalism?—Do you mean as a general proposition?

10,626. No, as a proposition relating to the coal industry in the connection in which you deal with it?—I certainly should not be in favour of a sudden revolution introducing syndicalism the day after tomorrow, or even on June 20th, but I am not at all afraid of it as something which may be led up to by a gradual process.

10,627. You are in favour of its gradual introduction?—Yes. People will make a great mess of things if they are put in charge of a new system all at once. If you give them time and an educative process it can be done, and in a shorter time than some people imagine.

10,628. By "Syndicalism" I understand you mean the government of an industry by the workers in it?—By everyone engaged in it.

10,629. By workers, I mean that. In the last paragraph of your proof you say that a monopoly of that kind would not be open to certain criticisms which are sometimes brought against it. For example, I understand that you think it would be less dangerous than a monopoly established by a combination of capitalists. Is that correct?—Yes, I think there is a difference. Where the capitalist has some particular interest, either philanthropic or possibly in a long distance view of his own profit which causes him to desire to keep a large number of persons in constant employment and not reduce his number, in that case you constantly find that acts as a protection to the consumer and causes prices to be lower than otherwise they would be, because he wants to go on giving this amount of employment. If you put men in the position of employing themselves, they feel the same thing only much more strongly.

24 April, 1919.]

PROFESSOR EDWIN CANNAN.

[Continued.]

10,630. If you had to choose between a monopoly of the workmen engaged in the industry and a monopoly of capitalists engaged in the industry, you would choose the former?—If you had to make a sudden choice between the two, it would be such a bad thing, it would be difficult to say which would be the worst.

10,631. I do not say a sudden choice but the only choice, which is the suggestion I put before you?—The future is all with the workmen's side.

10,632. *Sir L. Chiozza Money*: I think on page 2 of your *précis* you rather express the opinion that nationalisation or public ownership almost necessarily leads to subsidies to be paid by the public?—Yes.

10,633. Is that opinion of yours based upon an examination of the facts?—I think there are a great many facts to support it.

10,634. May I ask you, have you examined the facts relating to the Commonwealth of Australia, for example?—There may be some profitable things in Australia.

10,635. I asked you if you based your opinion on an examination of facts. Have you examined the facts with regard to Australia?—No, I cannot say that I know much about Australia. I know more about this country.

10,636. You are not aware then that the railways in Australia are based on very low fares and very low freights for merchandise and yet make a profit?—The only thing I remember about the State Railways of Australia was a very serious strike there, which the Government suppressed.

10,637. I asked you, with regard to the points you make in your paper, whether or not they need a subsidy, is it within your knowledge that the Australian State Railways need a subsidy?—I do not know.

10,638. Then so far as Australia is concerned your opinion was not based on facts?—There may be one or two instances.

10,639. May I ask you to pass from a very democratic position of affairs to the—much as we deplore it—bureaucratic position of affairs in Germany. Is it within your knowledge whether subsidies were required in Germany?—I mentioned something about Prussia. At the bottom of page 2, column 1, you will see there is a suggestion which covers the profits made by the Prussian Railways.

10,640. Are you aware that a very handsome profit was made by the Prussian State Railways?—Yes, but I believe now they are making a great loss.

10,641. I am speaking of peace conditions?—I am aware that the Prussian Railways used to make a profit.

10,642. So that both under the democratic conditions prevailing in Australia and the bureaucratic conditions of Prussia—which, as I say, we deplore—a profit was made and not a loss?—Yes, I suggested that it was possible in Prussia. The Authority in Australia seemed to be strong—at any rate it was able to defeat a strike.

10,643. At any rate, Australia is a very democratic country?—I believe so.

10,644. Now, to go to our own country, and taking the electric light and power undertakings of this country, do they require a subsidy?—Some of them.

10,645. Do they as a whole? Let us come nearer home and take the London Companies: do the electric municipal enterprises of London, for example, require

a subsidy?—I am not able to say about the London ones for the moment.

10,646. I am asking about the London ones. Can you give me an answer?—I do not know.

10,647. I take it that your opinion expressed on page 2 was not expressed with a considerable knowledge of the facts?—Yes, I have considerable knowledge about municipalities altogether.

10,648. May I ask you, have you seen the return with regard to the municipal undertakings of this country? Does that allege that a subsidy is required?—It shows that subsidies are required in many cases.

10,649. Did you see the return which I made when I was a Member of Parliament?—I have seen a return, but I do not know whether it was yours.

10,650. Are you aware that it showed that a subsidy was not required on account of public ownership? However, I will not press that any further?—I may say that you will observe that I do say "State or municipal enterprises."

10,651. At any rate, there are a number of cases which do not bear out the opinion you have expressed to me?—There are cases on both sides.

10,652. Is it not the fact that the majority of cases do not bear out the opinion you have expressed?—I doubt that.

10,653. *Mr. Evan Williams*: In your projected scheme of evolution you advocate giving fuller knowledge to the men of the facts of the industry?—Yes.

10,654. Do you regard it as essential that those facts should be given by individual pits, or would the facts given by districts be sufficient in your view?—I think that is rather too technical a matter to ask me about.

10,655. I am asking you because you say that if the colliers at an individual pit were to benefit by the results of that pit it would not be quite the best thing?—Yes.

10,656. Does it not follow from that that district returns and district information would be more useful and better for the industry than individual returns?—I should have thought that district returns would have to be made up from the individual returns. It might be necessary to have a good deal of the individual returns public to make the district returns reliable.

10,657. The district returns have, of course, to be ascertained by the investigation of individual figures?—Yes.

10,658. If that is done by a reliable means, say affidavits on both sides, to ascertain the district returns, would that be the sort of thing you have in your mind?—I would rather not express an opinion about that. I really do not know about the way in which pits are divided between companies, and so on, so as to be able to express a useful opinion.

10,659. *Mr. Arthur Balfour*: On page 5 of your proof you say that one of the best public services performed by the trade unions is the insisting on equality of pay and other advantages for the same work?—Yes.

10,660. Do you know whether the miners, the hewers, who employ boys underground, pay them on that basis?—I have no technical knowledge of the industry at all. I was speaking of trade unions generally.

10,661. You do not know?—No.

(The Witness withdrew.)

Mr. HAROLD COX, Sworn and Examined.

10,662. *Chairman*: You are the Editor of the "Edinburgh Review" and the author of a number of publications upon economic subjects?—Yes.

Chairman: Mr. Cox has been good enough to send the Commission a very short *précis* of his proof, and he has brought with him this afternoon a careful analysis, somewhat extended, of what he proposes to say, which I will circulate at once. What I propose to do is this. I will read Mr. Harold Cox's short *précis*, and then ask any members of the Commission who desire to ask him questions to do so, and later on

I will see that the whole of this further statement is read, either in the middle of his examination or by way of further examination. For the moment I cannot read it, because it has only just been put in my hands. Mr. Cox says:

"The demand for nationalisation is not due to material grievances but to an agitation carried on by theorists in favour of State Socialism.

The Fabian Society has played a prominent part in this agitation.

Many of the arguments used in the Fabian pamphlet

24 April, 1919.]

Mr. HAROLD COX.

[Continued.]

are irrelevant; other arguments are inconsistent with the actual scheme proposed.

The Miners' Federation in 1912 adopted a scheme practically identical with the Fabian scheme, but has since modified its proposals.

Other miners' organisations are even more emphatic against State Socialism and demand the control of the mines by the miners.

The question of royalties is relatively unimportant. Existing royalties cannot honestly be confiscated. There is a theoretical case for the expropriation of future royalties by the State, but the practical gain—if any—would be small.

The essential problem is to reconcile as far as possible the interests of the people who work the mines with those of the rest of the nation.

Direct State ownership involves the dead hand of bureaucracy, combined with intermittent interference from the House of Commons on purely political grounds. Both influences are fatal to industrial and commercial efficiency. Experience shows that employees of all grades work better for private employers than for the State.

The control of the mines by the miners gives no hope of efficient management, and no guarantee for the protection of the interests of the consumer.

It is an advantage to the community that the private capitalist should be interposed as a buffer between particular groups of workpeople and the rest of the nation.

Any advantage that occurs through the existence of a multiplicity of separate mining properties has a valuable effect in the stimulus to efficiency and the check on profits that competition provides.

Where considerable economies can be secured by amalgamation, private owners will tend to amalgamate their properties without any assistance or pressure from the State.

As regards distribution, a multiplicity of small agencies is costly, and it is desirable to encourage the formation of large distributive agencies on the analogy of United Dairies in London. The interests of the consumer should be protected by a provision similar to the statutory rule in the case of Gas Companies, which provides that prices must be lowered when dividends are increased, and that prices cannot be raised unless dividends are lowered.

Both for production and for distribution it is imperative to preserve private enterprise."

I will read your further statement later, when it will come more convenient in re-examination.

Witness: Might I suggest that it would save the time of the Commission, I think, if I read this now, and then I could be examined on it.

10,663. If you please?—"The demand for nationalisation is in no way the outcome of present conditions of service in the mines. The Nationalisation of Mines and Minerals Bill was adopted by the Miners' Federation of Great Britain in October, 1912. The Interim Sankey Report states: 'To some of our colleagues, whose opinions we greatly value, nationalisation has been the study or ambition of a lifetime.' The demand springs from a theoretical pre-conception in favour of nationalisation as an ideal solution of social problems. Certain people adopt this conception with enthusiasm and it assumes in their minds all the force of a dogmatic creed. They then begin to look about for material arguments in support of it. A generation ago the popular creed was that the State should appropriate the land, or any inherent value in the land, leaving capital untouched. Under the inspiration of this earlier creed royalties were attacked, but not profits. In 1886 the Trade Union Congress meeting at Hull unanimously passed the following resolution:—

"That, in the opinion of this Congress, the royalty rents and other charges demanded by the landlords of this country are iniquitous and injurious; iniquitous, because they form a monopoly of our mineral resources, where they should be used for the good of all; injurious, because they place a tax upon our staple industries, interfering with, and hindering our commercial prosperity, restricting the profits of the capitalists, and limiting the already too small wages of the workman."

"It will be observed that in 1886 the representatives of Labour were apparently anxious to secure larger profits for the capitalist as well as larger wages for the workpeople. This resolution was quoted with approval in the House of Commons in 1894 by Mr. Woods, a miners' representative, in bringing forward a motion in favour of the abolition of royalties. Mr. Woods and his supporters disregarded the fact that a Royal Commission, which had been sitting for three years, and which included prominent miners' leaders, had reported unanimously that mining royalties were not injurious to the mining industry and only required subsidiary amendments. The subsequent decline in the agitation against mining royalties is indeed in no way due to the logic of facts; it is due to the influence of new theories. Henry Georgism is no longer fashionable; the prophet of to-day is Karl Marx. The agency which has done most to propagate State Socialism is the Fabian Society, a middle-class organisation drawing most of its brain-power from Mr. Sidney Webb, one of the members of this Commission. The arguments of the Fabian Society in favour of the nationalisation of mines therefore require special examination. They are set forth in a pamphlet published in July, 1916. Prominence is given in the opening pages to the statement that it is 'imperative to place this industry outside the control of private individuals or separate classes whose interests are not necessarily identical with those of the community as a whole.' The importance of this statement will be universally admitted. But the actual scheme of nationalisation proposed by the Fabians includes a provision that every person employed in the mines of the State should be compelled to be a member of the Miners' Federation of Great Britain (p. 30). That means that the power of the Miners' Federation, already almost irresistible even by all the forces of the nation, would be further strengthened. Yet the interests of that body and of the class which it represents are obviously not identical with those of the community as a whole. During the war the importance of continuity in the supply of coal ought to have been obvious to every citizen, yet there have been many threatened or partial strikes, and the Miners' Federation has used the threat of a general strike to extort from the nation terms which involve a heavy addition to the price of coal, or alternatively a heavy loss to the national exchequer. These demands Mr. Sidney Webb has supported. Considerable space in the Fabian pamphlet is devoted to the contention that the State would obtain a profit out of the mines for the benefit of the taxpayers, and a number of figures are worked out to show that, even after full allowance has been made for interest and sinking fund on the purchase of mines and of royalties, there would be a handsome net profit to the State. It is quite unnecessary to examine these figures in detail, for they depend on a series of unproved assumptions as to the efficiency of State management. To such assumptions the best answer is that exactly similar assumptions were made when Parliament was persuaded to take over the telegraphs. The original calculations of the Post Office showed a very handsome prospective profit for the State. These figures were subsequently modified, but even when the terms of purchase had been settled, the Chancellor of the Exchequer estimated that the annual net profit to the State would enable the whole debt to be paid off in 29 years. In the first year of State working, 1870, there was indeed a small net profit; in the second year that net profit almost vanished; in the third year it disappeared entirely, and the State telegraphs have since been worked at a loss, in some years exceeding a million sterling. Before they were taken over they were yielding a handsome profit upon which the shareholders paid income tax to the Government. The experience of the telephones, though not quite as bad as the telegraphs, equally shows that the State fails to make a profit where private capitalists succeed. It has also failed to give as good a service. The telephone service in the United States, managed by a company, is immensely superior to the State-managed service of the United

24 April, 1919.]

MR. HAROLD COX.

[Continued.]

Kingdom. In view of these experiences, and in view of the entirely speculative character of the figures given in the Fabian pamphlet, no value whatever attaches to the calculation that there would be a profit to the Exchequer. It is important to add that the men who put forward this calculation in 1916 as an argument in favour of nationalisation have since supported demands by the Miners' Federation which involve a heavy loss to the State unless home prices for coal are raised even above their present level, for it will be impossible permanently to retain export prices at the present inflated figures. A similar condemnation applies to an argument used to attract the support of the private consumer of coal. It is categorically stated in this pamphlet (p. 39) that the State would be able to supply 'the best grades of household coal at 1s. a cwt. or £1 a ton delivered to the cellar free from the risk of rise when the cold weather approaches.' It is added that this would 'be hailed by millions of families as a boon.' This promised boon to the voter is further advertised and defined in the words: 'The Government coal department would by agreement with the State railway department deliver household coal to any railway station in Great Britain for 15s. a ton,' leaving the odd 5s. for the costs of the local authority who would convey the coal to the private cellar. This is the promise made by the Fabians to attract support for their scheme; Mr. Sidney Webb has signed a report which renders the redemption of that promise impossible. All the passages in the pamphlet devoted to criticism of the housing accommodation provided by colliery companies for colliery workers are irrelevant. These criticisms may or may not be justified in themselves, but they have nothing to do with the question of nationalisation; for it is not the practice of the State to provide houses, good or bad, for its employees, nor is it the practice of local authorities. Equally irrelevant are the pages devoted to the prevention of accidents. It is the duty of the mine-owner to take precautions against accident, and there are Government inspectors to enforce that obligation. To argue that better results would be achieved under State ownership is to condemn the present mine inspectors for dereliction of duty, and simultaneously to imply that the State would spend more largely on accident prevention with a consequent reduction of the promised profits on State working. The suggestion that technical improvements in working would be more rapidly adopted by the State than by private owners is contrary to all experience; and the implication that private owners have in the past done little or nothing to improve and develop the industry is negatived by actual records. In the fifty years preceding the war the output of coal from the mines of the United Kingdom increased from 86,000,000 tons to 287,000,000 tons. In the fifty years ending 1902 the death rate from accidents among miners dropped from 5 and 6 per thousand to 1 and 2 per thousand; and the death rate from all causes was reduced by more than half. Few industries can show a finer record than this. On the technical side, coal cutting machinery has been invented, electricity introduced, life-saving apparatus has been devised, and great subsidiary industries have been built up for the scientific utilisation of coal. All this has been done by private enterprise, without any assistance from the State; it has been done with capital reserved from profits, or raised in anticipation of profits. Considerable stress is laid by the Fabians, as by Sir Eric Geddes, upon the alleged waste involved in the use of privately owned trucks for the conveyance of coal. It is forgotten that a truck provides the cheapest form of storage for coal. Stress is also laid in the Fabian pamphlet on the fact that sometimes ships are waiting for coal, and sometimes coal is waiting for ships. The assumption that under State management no similar delays would occur is so flagrantly at variance with the experience of the country under the regime of universal State control that has been in operation during the war that comment is unnecessary.

The essence of the Fabian scheme of nationalisation is the creation of a Government department on the

lines of the Post Office, with a minister responsible to Parliament. The Fabian pamphlet begins with an allusion to the 'economical uniformity of the Post Office,' and with a view to the attainment of this ideal the pamphlet advocates the establishment of a standard quality of household coal at a uniform price. It may safely be prophesied that Government standard coal would be at least as unpopular as Government beer, or standard tea. I have said nothing there as to the enormous cost of bringing different qualities of coal together and blending them so exactly that every half cwt. might contain the same quantities of good and bad coal. Some collieries in the north of England supply no less than fifteen different qualities of coal to meet the wants of different classes of customers, domestic and industrial. In the South Wales export trade skilled specialists are employed to select particular coals for particular markets. The analogy of the Post Office thus completely fails. The Post Office is a favourite example for State Socialists. They are apparently unaware that, except as regards the conveyance of letters, the Post Office has for many years been virtually a bankrupt concern. The collection, conveyance and distribution of letters is as simple an industrial operation as can well be imagined. Yet the Post Office is only able to secure a profit on this simple business because it has a monopoly, which has again and again been used to suppress competition. As early as the reign of Charles II. private enterprise established penny postage throughout London and the suburbs, not only for letters but also for parcels up to 1lb. in weight and for sums of money up to £10 in value. There were eight deliveries a day in the city and four in the suburbs. The enterprise was most successful, but was crushed by the State as an infringement of the Crown monopoly. In the same way, the development of the telephone in the United Kingdom was for many years blocked by the State as an infringement of the monopoly which the Courts held to have been conferred upon the Post Office when the telegraphs were taken over, although the telephone was not then invented. A smaller example is the case of the Express Messenger service in London. This was started by private enterprise and was held to be an infringement of the Post Office monopoly. It was allowed to continue only on condition of paying a tax of a penny to the Government on each message carried. In the case of the parcels post the Post Office has no monopoly and works at a heavy loss. The Fabians, again following—or leading—Sir Eric Geddes, contend that State control of the coal industry would economise rail transport. The experience of State control during the war negatives this assumption. For example, the Leeds Corporation gas works were compelled by the Coal Controller to use Durham instead of Yorkshire coal. It was less suitable for the purpose, it involved much longer haulage, and cost more. The Corporation complained bitterly." If the Commission wishes if I can read a statement I have from the Corporation.

Chairman: Thank you, but we quite accept that.

Witness: "A peculiar feature of the Fabian scheme is a proposal for the establishment of a national store of coal, so as to secure continuity of employment in the mines throughout the year. But coal rapidly deteriorates in the open air. If kept under cover or under water the deterioration is slower; but not only is the repeated handling very costly, but it involves breakage with consequent loss of value. The proposal is quite impracticable. The importance of continuity of employment in all industries is recognised by everyone, but it must not be bought at the price of wasting national resources. A more hopeful line of development is in the direction of so organising industry that men who work in seasonal industries should have an alternative trade. A house painter who can do nothing but house paint must be idle during the winter. A great improvement could also be effected if wage-earners would enter into long contracts of service so that the employer could afford to pay them full wages for an annual holiday to be taken in slack times. This would make life less anxious and more enjoyable for the worker,

24 April, 1919.]

MR. HAROLD COX.

[Continued.]

but it would interfere with the socialist policy of the lightning strike. The scheme of nationalisation put forward by the Miners' Federation in 1912, differs little in general character from that of the Fabian Society. There is, however, a difference of principle on the question of compensation to the owners of royalties. The Fabians have never been led away by the rhetorical sophistries of Henry George, and rightly argue that there is no more reason for confiscating mining royalties than any other legally recognised form of property. The Miners' Federation, still influenced by the Henry George phase through which it passed thirty years ago, proposes to confiscate mining royalties. So far as existing royalties are concerned this would be a clear breach of faith by the State with those persons who have acquired a property in royalties under the sanction of the law. So far as undiscovered coal is concerned there is a theoretical case for treating coal and all minerals as gold and silver are already treated, namely as the property of the Crown. Whether the pecuniary gain to the State would be very great is another matter. The royalties and wayleaves now paid to private owners amount to less than £7,000,000 a year. They are subject to income tax, to mineral rights duty, to excess mineral rights duty and in many cases to super-tax: in Scotland they are subject also to local rates. Thus the State already gets with the present scale of taxation more than half of the total. In countries where minerals are in theory national property the State does not appear in practice to get as much as it does in Great Britain. It is important to add that the mine-owners, i.e., the persons who work the mines and pay the royalties, appear generally to hold that they can deal more satisfactorily with private royalty owners than they could with a government department. To show the relative unimportance of the matter it may be further pointed out that after the State and the local authorities have taken their share of the existing royalties the sum remaining to the owners represents very little more than 1s. a week on the wages of the workers. The Interim Sankey Report has awarded the workers an increased wage of 2s. a day, which is being now provided out of the public exchequer. The nation will not get cheap coal either by confiscating existing royalties or by appropriating future royalties. Apart from the difference of opinion between the Fabians and the Miners' Federation on the question of royalties, the Miners' Bill of 1912 is virtually the same as the Fabian scheme of 1916. Both propose to hand over all the mines of the kingdom to a gigantic centralised bureaucracy with a minister constitutionally responsible to parliament. Since 1912, however, the Miners' Federation appears to have changed its policy. Mr. Straker, Secretary of the Northumberland Miners' Association, laid before this Commission on March 14th last, in the name of the Federation, a scheme of a very different character. He stated that since 1912 'thought has been growing and maturing on the subject, so that now the miners are not only asking for nationalisation, but also for joint control of the mines.' He stated that 'nationalisation with bureaucratic administration,' which is the Fabian ideal, will not prevent unrest, and declared that the worker 'must have a share in the management of the industry in which he is engaged and understand all about the purpose and destination of the product he is producing; he must know both the productive and the commercial side of the industry.' With the desire of the wage-earner to have a voice in determining the conditions under which he works I have the fullest sympathy. Nobody knows where the shoe pinches but the wearer, and provision should be made to enable the workers to discuss with the management questions affecting their comfort and convenience. When, however, it is suggested that the average miner, or the average citizen of this or any other country, is competent to share in the highly technical and elaborate work of managing a mine, and organising the sale of its produce, I demur. The capacity for industrial or commercial management is a very rare gift; that is the reason why managers command high salaries. Nor does the average man want to be worried about the problems

of management. He is concerned about his pay, his hours of work, and the continuity of his employment; for the rest, he wants to enjoy in his own way such pleasures of life as his income commands. Few men even trouble to attend trade union meetings. Exactly how the miners are to control the industry Mr. Straker does not explain. He states, for example, that the Minister of Mines is to fix prices, though this might often result in miners being thrown out of work against their will. He realises that the Minister would have to be responsible to parliament, and wisely proposes to begin by educating the House of Commons (p. 344). We shall probably have burnt a good deal of coal before that process is complete. Other miners are even more emphatic than Mr. Straker in their opposition to bureaucratic control of the mines, with the House of Commons as the final authority. A pamphlet called 'The Miners' Next Step,' issued by the Unofficial Reform Committee in South Wales and published about the middle of 1911, denounces nationalisation as a device of the capitalists. The programme of this Committee is to establish a 'policy of open hostility' between employers and employed. (p. 26). Lodges are to discard the old method of coming out on strike and to adopt 'the more scientific weapon of the irritation strike by simply remaining at work, reducing their output and so contrive by their general conduct to make the colliery unremunerative.' A continued agitation for higher wages and shorter hours is to be carried on 'until we have extracted the whole of the employers' profits.' The object laid down is 'to build up an organisation that will ultimately take over the mining industry and carry it on in the interest of the workers.' This amounts to a claim that the miners are to be allowed to treat our greatest source of natural wealth as if it were their private property. They propose to substitute the profiteering of the proletariat for the profiteering of the capitalist. On the other hand, if the mines and other industries are placed under the direct control of the State the danger to the liberty of the workman becomes very grave. At the moment that danger is only dimly seen, for as the result of clever organisation and cynical indifference to the interests of the nation, a large body of men like the Miners' Federation is able to hold the State to ransom. But that power will disappear as the use of it extends. As each industry in turn becomes a burden on the national exchequer the hard realities which distinguish plus from minus will assert themselves and the collective power of the nation will be used to compel miners to work for such a wage as the Government of the State chooses to fix. Industrial conscription with all the waste and hardship that it involves will take the place of the present industrial liberty. State control of the mining industry is peculiarly undesirable because it is largely an export industry. This branch of the industry must necessarily be conducted in keen competition with foreign countries, and a war of coal prices may easily be as destructive of international amity as a war of tariffs. The interest of the nation lies in obtaining coal at the lowest possible price consistent with the adequate remuneration of the persons employed and of the capital invested. The work in mines is in many respects unpleasant, though relatively healthy even when allowance is made for the high rate of accidents. It is right that the work should be paid at higher rates than more agreeable work above ground requiring similar skill. That has been done in the past. That the work has not been underpaid in comparison with other manual work of similar character may be inferred from the growth in the number of men employed. Between 1894 and 1913 the number of persons employed in the coal mines of the United Kingdom increased from 693,000 to 1,118,000. Such progress as this would have been impossible if the miners had been relatively underpaid. As regards distribution, it is probable that a good deal of economy could be effected by amalgamating many of the numerous distributing agencies now engaged in selling and delivering coal. In the case of milk this is already being done, and the United Dairies, Ltd., has by its operations removed about 1,000 horses from the streets of London. The economies in the case of coal are obviously less than in the

24 April, 1919.]

MR. HAROLD COX.

[Continued.]

ease of milk because the number of deliveries is smaller; but the example is worth noting. The interests of the consumer can be, and should be, protected either by statutory provisions analogous to those regulating the dividends of gas companies or by a voluntary agreement between the distributing agency and its customers on the lines adopted by co-operative societies. The failure of State management is finally due to the fact that individual motives operate against efficiency in the case of State-managed concerns and for efficiency in the case of privately-managed concerns. Members of Parliament and public officials are not inherently more vicious than the rest of the community. We probably all of us have about the same proportions of egoism and altruism in our composition. But in the case of a private concern the motive of self-interest or self-preservation, which is necessarily the strongest motive in most living creatures, impels a man to work for the success of the concern. But the self-interest of a Member of Parliament or of a Government official is in no way affected by the success or failure of State mines or State railways or State telephones. No Member of Parliament is likely to lose his seat or his salary because a State-managed concern shows a debit balance. On the contrary the more Government jobs a Member of Parliament can find for his constituents, however useless they may be to the nation, the more likely is he to be re-elected. In the same way a Government official suffers nothing if the State concern in which he is employed is a failure and gains nothing if it is a success. His self-interest lies in increasing the importance of his own department by multiplying the number of employees, regardless of their real utility, and in making life easy for himself by following an established routine instead of trying to think out improvements. The self-interest of private individuals in competing with one another works for the advantage of the rest of the nation; the self-interest of Government officials scheming to magnify their offices and to cover up one another's mistakes, works against the interest of the nation. It is true that persons employed in subordinate positions in any big concerns tend to have the same mentality as Government officials; but there is in practice an appreciable difference, because the risks of dismissal and the chances of promotion are greater; and also because however big a privately-managed concern may be it is very small compared with the whole nation. People who would hesitate to rob a company will smilingly rob the State."

Chairman: We are very much obliged to you for the very clear way you have put your views before us.

10,663. *Mr. Sidney Webb:* You have paid me a great compliment in assuming that I am responsible for the extensive spread of the principles of nationalisation. Do you really seriously contend that it is dependent on anything I have done?—I have always looked upon you as the brain power of the Fabian Society, and it was a Fabian pamphlet that I was criticising. My argument was that the Fabian Society has been the most prominent agency in promoting State Socialism for years past.

10,664. May I remind you that that pamphlet was not published till 1916? You do not suggest that the movement for nationalising has arisen since 1916 do you?—No; my argument is that for twenty or thirty years the Fabian Society has been the leading association, and therefore, that it is important to know what the views of that association are.

10,665. You have given the Commission to understand that in your opinion the whole movement for the nationalisation of coal mines is due to the influence of the Fabian Society, and particularly to that pamphlet to which you have referred?—No, I said the general movement of State Socialism.

10,666. Then you do not say that that is so of the coal mines?—What I stated is that the Fabian Society is the leading agency which has done most to propagate doctrines of State Socialism.

10,667. You say that the demand for nationalisation is not due to material grievances, but to an agitation carried on by theorists in favour of State Socialism in which the Fabian Society has played a prominent part?—If you look on the first page, I say that it springs from a theoretical preconception in favour of nationalisation as an ideal solution of social problems.

10,668. I was reading from your *précis* in which you say: "The demand for nationalisation is not due to material grievances but to agitation carried on by theorists in favour of State Socialism. The Fabian Society has played a prominent part in this agitation. Many of the arguments used in the Fabian pamphlet are irrelevant." Now I put it to you that the whole effect of that is to suggest that the demand of the Miners' Federation for nationalisation has been due very largely to the Fabian Society, and in particular to the Fabian pamphlet published in 1916?—No. I will try to make it clear if I can. What I mean is that the Fabian Society has instilled into the minds of the mass of people a theoretical preconception in favour of State Socialism.

10,669. I thank you for the advertisement, but I am afraid, in the interests of accuracy, I must disclaim having had all that influence which you suggest on the million members of the Miners' Federation. Of course, you put it very strongly that there are people who have, shall we say, a craze for nationalisation?—Yes, I do not mind your word.

10,670. May I not suggest to you that there are other people who have an equally strong opinion in favour of individualism?—Quite so.

10,671. You put them on a par?—Absolutely.

10,672. Therefore the assertion is rather a disparaging assertion that there are people who have this strong feeling in favour of nationalisation, because it amounts only to saying that there are people who have a strong feeling in favour of something; but there are others who have an equally strong feeling in favour of individualism—you, yourself, for instance?—Yes.

10,673. Would you suggest that your feeling is of any more value than, say, my strong predisposition on the other side?—I did not attempt to balance the two.

10,674. You did not suggest that the other people had any predisposition at all: you held those people who had a view contrary to your own up to opprobrium or criticism?—We tend always to do that in controversy.

10,675. You will agree that one strong opinion is very like another strong opinion?—If you like to put it that way.

10,676. You do not suggest that those people who believe that public advantage would be served by the nationalisation of the coal mines are any less entitled to be listened to than the people who have an equally strong opinion that the public would be better served by the mines being left as they are?—I like everybody to be listened to.

10,677. You do not suggest that the nationalisers, if I may use that word, are any less worthy of credence?—I should be very sorry to suggest it.

10,678. I put it to you that the whole of your argument might be thought to lead to that, but I may take it that you did not intend it?—No, I did not.

10,679. Then you say: "The Miners' Federation in 1912 adopted a scheme practically identical with the Fabian scheme": I take it you mean the Fabian Society's scheme of 1916?—The scheme described in the Fabian pamphlet.

10,680. That is 1916. I want to emphasise that date. The Miners' Federation appears to have been in the field, as regards coal, before that time?—In putting forward a Bill, no doubt.

10,681. That is to say, we republished the Miners' Bill after the miners had drafted it?—I do not know who were the authors of the Bill originally.

10,682. I suggest to you that it is not quite accurate to state that it was the Fabian Society who suggested the Bill to the Miners' Federation, the fact being that the Miners' Federation suggested the Bill to the Fabian Society?—Did not the Fabian Society help in drafting it?

10,683. No. I cannot tell what individual members may possibly have done. Then you say: "Other Miners' organisations are even more emphatic against State Socialism." In your fuller statement you refer, towards the end, to a pamphlet called "The Miners' Next Step," and you say that was issued by the Unofficial Reform Committee in South Wales and published about the middle of 1911, and denounces nationalisation as a device of the capitalists. Then you go on to say: "This amounts to a claim

24 April, 1919.]

MR. HAROLD COX.

[Continued.]

that the miners are to be allowed to treat our greatest source of natural wealth as if it were their private property." Does it not occur to you that a little misapprehension might be caused by your use of the word "miners" there? Generally speaking, you use the word "miners" as referring to the Miners' Federation, or the great bulk of the members, and there you are using the word "miners" in relation to this unofficial Committee in South Wales. On page 15 do you suggest that that pamphlet at all related to the views of the Miners' Federation?—I did not say that.

10,684. No, you only said that it related to the views of the miners?—I say this amounts to a claim by this particular body.

10,685. You say "This amounts to a claim that the miners are to be allowed," etc.?—It is a claim by this organisation that the miners are to be allowed.

10,686. You did not mean to imply that the horrible conduct which you are there denouncing in that pamphlet was at all typical of the miners generally?—I certainly do not say so.

10,687. What I am asking is, Did you imply it? You are a master of literature, and you know it is possible to imply a thing without saying it?—I should be very sorry to do so. I say this is a special body in South Wales, and that they put forward a particular proposal which amounts to a claim that the miners are to be allowed, etc.

10,688. You did not mean to create the impression that that was at all characteristic of the Miners' Federation? If you did not mean to give the impression that that was typical of the Miners' Federation, would it not be well that we should have that clearly on the notes?—I have no evidence that the Miners' Federation have accepted that.

10,689. I take it that you would not make the statement without the evidence?—I have not made the statement.

10,690. You do not wish to imply that the Miners' Federation are sharing in this view?—I say the contrary higher up.

10,691. Then you can answer yes or no as to whether you meant to imply that?—Of course I did not mean to imply the contrary to what I said.

10,692. Then you turn to the question of royalties, and you explain very properly that there has been a change in the opinion of a number of people with regard to royalties. May I ask you to look at page 2, where you say: "The subsequent decline in the agitation against mining royalties is indeed in no way due to the logic of facts: It is due to the influence of new theories. Henry Georgism is no longer fashionable: the prophet of to-day is Karl Marx." Then you go on to say: "The agency which has done most to propagate State socialism is the Fabian Society." Did you wish to suggest that the Fabian Society had passed from the doctrines of Henry George to those of Karl Marx?—No, I did not, because I say later that the Fabian Society was not touched by that doctrine.

10,693. Did you mean to suggest that it was chiefly remarkable as propagating the doctrine of Karl Marx?—No.

10,694. You would not wish to imply that the Fabian Society has ever had anything to do with propagating the doctrines of Karl Marx?—No. My recollection is that the Fabian Society has always looked on Karl Marx as a colossal humbug.

10,695. There again I wish to give you the opportunity of saying that you did not mean to imply that?—Certainly.

10,696. Do you suggest that that transition from Henry George to Karl Marx is characteristic of the Miners' Federation?—That is my impression.

10,697. Is there anything in the Miners' Federation of Great Britain, either in their constitution or in their publications, which has any relation to the teachings of Karl Marx?—I should say generally that the whole socialist movement in this country is not easily distinguished from the Karl Marx doctrine.

10,698. I asked if the Miners' Federation has ever betrayed any affinity to Karl Marx?—I can only speak of their general policy.

10,699. Then I may take it that you did not intend to imply that the Miners' Federation is at all influenced by Karl Marx?—I think that it is.

10,700. I asked you whether you wished to imply it?—I have tried to make my meaning clear.

10,701. You point out that the Miners' Federation attacked royalties, as you suggest, under the influence of Henry George. Then you say: "Henry Georgism is no longer fashionable: the prophet of to-day is Karl Marx." The implication would be that the Miners' Federation has done that?—Yes, I think it is probable.

10,702. Do you suggest it?—Yes.

10,703. Do you remember anything that Karl Marx has said about mining royalties?—No, I was not dealing with mining royalties there.

10,704. On page 2 you set out the resolution of the Trade Union Congress, moved by the Miners' Federation, with regard to mining royalties?—Yes.

10,705. And you explain that the decline in the agitation has been due to the change of influence from Henry George to Karl Marx?—Yes.

10,706. Surely that is a suggestion that the Miners' Federation has come under the influence of Karl Marx?—That does not affect the mining royalties.

10,707. I am giving you an opportunity of repudiating the mistaken inference that may be drawn from your statement that the Miners' Federation has been guilty of these things?—The Miners' Federation has come under the influence of Marxian doctrines, and the essence of that doctrine is an attack on profits, and the Miners' Federation is now attacking profits.

10,708. Have you noticed any weakening in their willingness to attack royalties?—No, but less importance is attached to it than attacking profits. In 1886 they did not attack profits, and now they do. That is the whole point of my remark.

10,709. On page 3 you say: "The actual scheme of nationalisation proposed by the Fabians includes a provision that every person employed in the mines of the State should be compelled to be a member of the Miners' Federation of Great Britain." You rather imply that that is some new wickedness which the Fabian Society has invented for the enslavement of the workmen. Do you suggest that it was the Fabian Society that invented that?—No, I do not suggest that the Fabian Society invents everything that it advocates.

10,710. You suggest, at any rate, that the scheme proposed by the Fabians includes that provision?—Yes.

10,711. That rather indicates that you think it was in some way peculiar to the proposal of the Fabian Society?—No, I was drawing a contrast between this provision and the statement made by the Fabian Society that the industry must be outside the control of a class whose interests are not identical with those of the community as a whole.

10,712. You make a reference to page 30, and on that page you will find that, as a matter of fact, in 1916 in South Wales all the men in the pits except the officials were required to be members either of the Miners' Federation or of the corresponding Society of Enginemmen. On that same page where you make that statement may be found the fact that it was already in existence in South Wales?—What is the relevancy of that?

10,713. The point is that you suggest here that the actual scheme of nationalisation proposed by the Fabians includes a certain provision. What the Fabian Society in its pamphlet did was to point out that the Government had already brought that into effect. What I want to ask you is whether you think there is anything peculiar in the Fabian Society in having suggested that this would happen when, as a matter of fact, it was already in application in South Wales?—I did not intend to suggest that it was peculiar. All I intended to state was that there was a direct conflict between the one statement that the industry is to be free from control by classes whose interests are not identical with those of the rest of the community, and the other that every miner must become a member of the Federation.

24 April, 1919.]

MR. HAROLD COX.

[Continued.]

10,714. The implication of your statement is that it was the Fabian Society in particular which made this proposal. Would it not have been clearer if you had said that this has already been carried out by the Government as regards South Wales?—It would be irrelevant. The point is to draw a contrast between the Fabian proposals and the Fabian theories.

10,715. Would it not be clearer if you had said, between the Government proposals and the Fabian theories?—No, because the Fabians advocated it on page 30.

10,716. They do not advocate it; as a matter of fact, it is merely suggested that the State would necessarily be led to make membership compulsory?—Then you mean that you do not approve of it being compulsory?

10,717. I did not say anything about that. I was only saying that you were misquoting. You begin at the beginning by suggesting that "Prominence is given in the opening pages of the statement that it is imperative to place this industry outside the control of private individuals or separate classes whose interests are not necessarily identical with those of the community as a whole." Do you agree with that statement?—Yes, quite.

10,718. You do agree?—Yes.

10,719. You say, and I will read it: "It is imperative to place this industry outside the control of private individuals or separate classes whose interest are not necessarily identical with those of the community as a whole"—I entirely agree with that.

10,720. I am glad to find that you are still in agreement with the Fabian Society upon that point?—I said I agree.

10,721. You suggest because it is pointed out that a Trade Union will necessarily exercise great influence that that is in some way in conflict with it?—Certainly.

10,722. Surely there are two ways of placing it outside the control of private individuals or separate classes and that is one way to keep all classes out of it, in which case it would be carried on by the angels. The other is to bring all classes into it. Can you suggest any other way by which it might be done?—It is insisted that every person employed in the mines should be a member of the Federation. You place in the hands of the Federation the power of the control of the industry in the interests of itself.

10,723. Do you place them in a position of power to control the interests autocratically. There is such a thing as balance of power?—It is difficult when every man is compelled to belong to a Trade Union to resist the orders of the Committee.

10,724. Is there any way of preventing any man being a member of a Trade Union?—I say I should think that the Fabian Society having put forward this first proposition, it ought to go on to argue we ought to use our utmost endeavours to prevent every member becoming a member of one Trade Union.

10,725. You suggest the alternative would be like the simile of rats in a bag, so that each should be cutting its own throat?—I think the community gains by competition between individuals.

10,726. No doubt you do think that. At any rate, we have cleared up that particular point. You believe it is imperative to place this industry outside the control of private individuals or separate classes whose interests are not necessarily identical with those of the community as a whole. How would you apply that to coal owners?—The coal owners do not form a syndicate or ring; they are in competition with one another.

10,727. They form a separate class?—No, they do not form a separate class.

10,728. You did not mean a class of landlords?—No; landlords are in competition with one another.

10,729. You have said twice you agree with the statement, but now you are specifying something else. You said a ring or a trust?—That is what I object to.

10,730. You said you object to either being in control of the capital classes?—I object to uncontrolled trusts.

10,731. Is that the same as a ring or trust?—A ring or trust I should regard as a class.

10,732. That is a simple conversion of A. You have not forgotten your logic. A ring would be a separate class, but is a trust a ring?—I do not understand what you mean.

10,733. Then let us pass from that. You point out this particular pamphlet of the Fabian Society which described for the first time the nationalisation of the coal supply. I think I may say it went into the question for the first time, and gave a number of details?—Yes.

10,734. You put it with great triumph those figures have become absolutely impossible?—Quite.

10,735. I suppose that is almost inevitable in the course of three years such as we have had, that figures quoted from 1913 would be out of date at the present time?—Yes. I should have thought the people who put forward those figures as an argument for a particular class would be trying to get back to them as far as possible and not go away from them as far as possible.

10,736. You are not casting a doubt upon these figures?—I say they are all speculative.

10,737. So far as they are quotations of the figures of 1913 you are not impeaching them?—I daresay the particular figures are right, but so far as based upon fact they are really speculative.

10,738. Your criticism again implies the figures are something not so good as that?—I say they are speculative. I do not suggest they are dishonest.

10,739. I am very glad you have made that clear. Some of your statements seem to be rather to the contrary. You point out that since that time the miners have received an increase of wages. Do you suggest it was wrong for the miners to have received an increase of wages since this pamphlet was written?—No, my suggestion is the Fabian Society was advocating a course in conflict with the prospects it previously held out to the public.

10,740. Can you suggest any way in which a pamphlet printed in 1916 can be in some way remedied if the circumstances have changed?—You mean withdrawn from sale?

10,741. Yes?—Has it been withdrawn from sale?

10,742. No, it has not. Do you suggest it ought to be withdrawn from sale?—Your argument seems to tend in that direction.

10,743. It is not my argument. My point is, you are rather contemplating the bottom has been knocked out of the calculation by saying that the miners have received several advances in wages?—Yes, and more are being advocated.

10,744. Do you think that is inconsistent with the argument?—Quite, because there is no chance of profit. One of the main points of this pamphlet was a profit would accrue to the State. I say that is impossible.

10,745. On certain terms of purchase or compensation. Does it not occur to you those terms of purchase or compensation depend absolutely on so many years' purchase of the net profits of the owners, and if wages rise so the industry pays less profit to the owner, and the compensation to them becomes smaller?—It depends upon prices.

10,746. It does not depend upon prices at all. If the compensation is so many years' purchase of the profits, and if a rise in wages reduces the profits to an extent, to that extent the compensation payable to the owners would be reduced?—Not if the price of coal is simultaneously high.

10,747. I say there is, to the extent to which there is a reduction in profits. If on the one hand the net profits are lower, so on the other hand the compensation payable will be lower?—What do you mean?

10,748. Do not you see that that leaves the calculation unaffected? You have not worked that out. You have not taken that into account?—I certainly have not taken into account that you meant the mine-owners were to be compensated on the basis of their having no profit.

10,749. You do not wish them to be compensated in any other way than in exact relation to their profits?—I imagine their profit is as high as it was then.

24 April, 1919.]

MR. HAROLD COX.

[Continued.]

10,750. Then the increase in wages has done no harm to them?—I was not looking at it from the point of view of the owners. I do not care about them.

10,751. If the profits are the same, then again the figures are not affected?—Yes, there is no profit to the State; that is what I think about.

10,752. The calculations remain as they were?—No, there is no chance of getting any net revenue for the State.

10,753. You assert that because of the theory with regard to efficiency, and the figures remain unimpugned?—Yes.

10,754. As a matter of efficiency that is a matter of production and neither can found a reasonable argument upon that.—I agree.

10,755. I grant you have as much to say for your side as I have for my side. Except that I have the experience of other States.

10,756. Have you as much experience as I have?—Yes.

10,757. Of other State Departments?—Yes.

10,758. Really we will not argue about that. There are experiences and experiences. You say "It is categorically stated in this pamphlet that the State would be able to supply the best grades of household coal at a shilling a cwt or £1 a ton delivered to the cellar free from the risk of rise when the cold weather approaches." It is added "This would be hailed by millions of families as a boon." This promised boon to the voter is further advertised and defined in the words that the Government Coal Department would by agreement with the State Railway Department deliver household coal to any railway station in Great Britain for 15s. a ton, leaving the odd 5s. for the cost of the local authority who would convey the coal to the private cellar." Then you say that has become impossible?—Yes.

10,759. The level of prices as you know has been altered to a very considerable extent quite irrespective of coal.—Yes.

10,760. Therefore any prices quoted six years ago would not be the same to-day?—No.

10,761. The currency change affects that?—Yes.

10,762. You do not suggest there is anything wicked in that?—Except this pamphlet as you told us is still in circulation so anybody who buys it would think the Fabian Society are promising coal at £1 a ton.

10,763. On the basis of 1913?—They would still think it held good.

10,764. They might be misled. With regard to the housing accommodation. You suggest that the criticism of the miners' houses is irrelevant. The housing accommodation has been to a large extent provided by the coal proprietors themselves?—Yes.

10,765. Is it irrelevant to criticise the houses that have been provided by the colliery proprietors as being very bad?—It depends upon the point of view from which you criticise them.

10,766. From a sanitary point of view?—From a sanitary point of view or from showing the colliery owners are stupid people or immoral. From the question of nationalisation it is irrelevant. The State does not provide houses for its employees.

10,767. That is to say, the State has not at present and you infer if the State were to put itself into the place of the colliery proprietors it would cease to provide houses for the colliery employees?—It might or might not.

10,768. You predict that?—I do not know.

10,769. You think it is probable the State would sell off all the cottages it took over from the colliery concerns?—No, it would probably keep them.

10,770. You suggest the State would find itself saddled with an obligation to house its colliery employees?—Because it would only inherit that obligation.

10,771. You do not suggest it would not agree to it. You did not mean to suggest that?—No, I meant to suggest on your argument for nationalisation the question of housing is irrelevant.

10,772. It did not occur to you the colliery proprietors actually provide the houses in a great many cases?—I know that.

10,773. Did you imply the State would sell off those cottages and give up that obligation?—No, I said it was an irrelevant argument with regard to nationalisation to criticise the existing housing accommodation. The State has not hitherto made it a practice to house its employees.

10,774. You admit the State would find itself charged with an obligation to house the colliery employees?—That is a different point.

10,775. Do you think if the State were directly responsible for providing a certain number of houses for colliery employees the State could be able to go on supplying the one room or two room house which has been supplied?—It depends upon the state of public opinion at the time.

10,776. Do you think it is probable?—No.

10,777. If the State were in position of the colliery proprietors do you think that the houses supplied would not be of a rather better standard?—I think the probability is the State would spend money lavishly on miners' houses at the expense of the general body of tax payers.

10,778. How is it hardly relevant to the question of the housing of the miners if you think the houses would be improved upon. Do not you see as a matter of fact nationalisation would be calculated, as you say, in all probability greatly to improve the quality of the houses provided for the miners?—Yes, where the State inherits the liability I think it is probable.

10,779. Therefore, it is not altogether irrelevant from the point of view of death-rate?—You apparently forget if the State spends money lavishly on housing it makes no profit for the tax payer.

10,780. Not so much profit possibly. The Fabian Society provided for housing accommodation for the miners at the cost of £5,000,000 a year. You say all questions about the prevention of accidents is irrelevant and we do not know what will happen with regard to accidents. Do you suggest it is quite reasonable to speculate that if the State were directly responsible for the accidents, if there could be a row in the House of Commons whenever there was an accident do not you assent there might not be a tendency to have fewer accidents and to take more precautions?—It is possible.

10,781. Therefore it is relevant, at any rate?—If you look at the argument you will see what I meant. We have already an agency for preventing accidents.

10,782. What is that agency?—The Mine Inspector.

10,783. The Mine Inspectors do not prevent accidents. It is not their duty to prevent accidents but to see to the enforcement by the colliery proprietors of their obligations?—That is what I meant.

10,784. That is not put on the Mine Inspector?—I mean the same thing as you do.

10,785. Is not that of importance; the Inspector has not any duty to prevent accidents; it is not the man's duty?—We mean the same thing.

10,786. It is an important duty whether the State has an obligation to prevent accidents and has the necessary power to make safeguards. Whether the State has the obligation or has knowledge the duty of enforcing the law on a set of capitalists without providing the precaution itself is important?—You would get better results that way.

10,787. Therefore it is not irrelevant?—You would get better results in the existing way.

10,788. Therefore the argument cannot be irrelevant. You keep saying in your statement that the question of the prevention of accidents is irrelevant. Did you mean that?—Yes, I mean there is no necessary deduction that the State would better provide against accidents if it owned the mines than it can do now.

10,789. Is that what you meant; it must be a necessary deduction?—I have given my answer.

10,790. You do not mean to confuse relevancy with its being a necessary deduction. Do you really mean because the State might if it were directly responsible and had the power to put safeguards into the mines which would have better results, or might do, do you mean to say that that is to argue that the Mine Inspector who has no power to put in new plant and who has only the power not to insist upon everything that might be desirable but only on the minimum the law provides—do you suggest it is to accuse

24 April, 1919.]

MR. HAROLD COX.

[Continued.]

him of dereliction of duty because he does not prevent accidents whereas the State might?—I adhere to my point.

10,791. Is it the duty of the Mine Inspector to require from a colliery proprietor more than the law exacts?—No.

10,792. The law exacts a minimum?—My contention is the law will under private ownership exact what is necessary to prevent accidents as far as that is possible.

10,793. You say it is a dereliction of duty of the Mine Inspector. The Mine Inspector cannot get the law altered?—They have to carry out the law.

10,794. If they have to carry out a minimum law you consider it implies a dereliction of duty on the legal authorities; whose duty it is to see that there are fewer accidents?—There would be a dereliction of duty on the part of the House of Commons.

10,795. Would you not wish to withdraw your argument with regard to the dereliction of duty?—No.

10,796. You still stick to that?—Yes.

10,797. You suggest that mining accidents have greatly diminished during the last 50 years. I agree with you. That is definitely stated in this pamphlet?—Yes.

10,798. You notice it is only the fatal accidents for which the figures are available. Have you considered the figures with regard to the non-fatal accidents?—No, frankly I have not.

10,799. That is rather an important item. You do not accept any suggestion apparently that there was a waste involved in the use of privately owned trucks?—I should think the waste is very small.

10,800. You do not give any importance to the fact of the unnecessary haulage?—No, for this reason, that the trucks are owned by the colliery proprietors and they pay for the haulage themselves both ways. I am quite certain they would not do that on the average unless it was the most economical way of dealing with the coal.

10,801. Unless it was the most economical thing to them individually?—It is a question of the railway companies charging higher rates.

10,802. It might not be the most economical to them collectively?—I do not know what you mean.

10,803. It is not so long as they are disunited. If all the 1,500 colliery concerns in the United Kingdom were united there might be another economical discovery?—There might be. If all the companies provided trucks on the same system as the North Eastern, possibly it might be more economical.

10,804. You do know there would be economy in having united ownership of railway trucks?—I doubt if there are many trucks wasted.

10,805. In your statement you seem to give the indication there would be no economy in a union of trucks. You state now there would be economy?—There are possibilities of economy all through life. I did not mean to imply there could be no improvement in the industry.

10,806. Is the point of the private ownership of trucks the only point in question. That can only have been to throw doubt on the possibility of there being any economy there?—When you say, "any economy," I admit in all things there can be some economy.

10,807. On the specific point of united service, you think probably there would be economy?—Probably; there is very little in it.

10,808. You said you thought there would be economy?—I said there might be a little economy. You are misstating me.

10,809. I am sorry. Your considered judgment is, there would be next to no economy?—It would not be worth thinking about.

10,810. On that we have the opinions of the railway experts and the coal experts?—I think Sir Eric Geddes' statement on that point was entirely stupid.

10,811. I daresay such a great man as Sir Eric Geddes makes foolish statements. He was making that statement not necessarily from his own experience, but on the faith of the reports of the experts who have gone into the matter from the point of view of the railway managers. Do you

think they have been wrong?—I still think the matter is one that can be quite easily settled between the coal owners and the railway companies. If there is any great economy that could be got, they will get it between them, one way or the other.

10,812. Your confidence in the power and ability of the coalowners to get economy leaves out of account what may suit them individually; it might not suit them if they were able for other reasons to combine. There are many practices which a number of separate traders have to adopt which would not pay them to adopt if all united?—If there is to be a big economy by combination the probability is the men will combine of their own accord.

10,813. That is an optimistic statement. You made that in your proof. In the next paragraph you said: "As regards distribution, a multiplicity of small agencies is costly, and it is desirable to encourage the formation of large distributive agencies on the analogy of the United Dairies in London. The interests of the consumer should be protected by a provision similar to the statutory rule in the case of gas companies, which provides that prices must be lowered when dividends are increased, and that prices cannot be raised unless dividends are lowered." Apparently what you mean is that the prospect of profit by combination does not seem to prevail in the coal-distributing industry, and in many specific instances they might be united. Did you mean to limit your statement to the private owners who will tend to amalgamate their property without assistance or pressure from the State? Did you limit that to coal production or eliminate coal production?—People in charge of the collieries take a larger view and look more ahead than people who are carting coal about.

10,814. Do you think the distributive agencies are small compared with the collieries?—Some are, some are not.

10,815. Some collieries are small?—Yes.

10,816. In both cases there are a lot of separate interests which did not combine?—Yes.

10,817. You suggest there might probably be a considerable economy in the combination of the distributive interests?—Yes.

10,818. Yet you do not see that there might be economy in the combination of the producing industry?—As far as I can form an opinion, the economy is more likely to be obtained in coal distribution than in working the mines. I am anxious to keep as much competition as possible between the mines so as to keep down the price for the benefit of the consumer.

10,819. You are anxious to keep up competition amongst the mines, but you are not anxious to keep up competition amongst the different distributors?—No, I suggest another way of getting the same result.

10,820. That is to say the interests of the consumer should be protected by the gas companies sliding scale?—That is so.

10,821. That is the suggestion you make?—Yes.

10,822. Do you suggest that is applicable to the distribution of coal?—I am inclined to think so.

10,823. Do you think it is applicable to the distribution of milk?—Yes.

10,824. We have been placed under a combination for the distribution of milk, we know such a thing has occurred?—It is a matter for control.

10,825. Are you in favour of State controlled capitalism exclusively in favour of milk?—I am in favour of the State control of monopolies. When there is a monopoly the State must interfere to protect the consumer.

10,826. You would interfere with the possibility of a combination of coal owners to protect their own interests or their own profits without very effective control by the State?—Certainly.

10,827. If the coal owners were to combine in a national trust you would think it inevitable or absolutely necessary that the State should control the price and various other things?—Certainly.

10,828. Consequently that would in all probability restrict the economy they would expect to get by combination. I am putting it to you that you say if there are enormous advantages to be got by unifica-

24 April, 1919.]

MR. HAROLD COX.

[Continued.]

tion you may rely upon the coalowners combining to get them. You say if they did combine to get them the State would have to take it away from them by its control, and that being so do not you think that rather discourages the coalowners from combining?—You are arguing about two different things. From the point of view of economy in production all you want is a combination in small groups according to the districts in which they are. As long as different districts are competing with one another the State need not bother with that combination. If you have a combination of all the colliery owners in the kingdom it would be necessary for the State to interfere.

10,829. In anything in the nature of what we call unification of the coal industry you think there must be safeguards, and most drastic safeguards by the State?—If you mean by unification without effective competition.

10,830. Assuming there is a suggestion of unification put up by the coalowners for the amalgamation or merging of all the coal mines in the United Kingdom into one great enterprise to secure economies which it is thought would be got, yet it is your opinion it would be absolutely necessary to interfere and have State control over the prices?—The State would have to protect the consumer.

10,831. Does not that involve the dead hand of the bureaucracy combined with intermittent interference from the House of Commons on purely political grounds?—I am not anxious that all the coalowners should combine.

10,832. If they do combine, it would involve that?—Yes.

10,833. Therefore, if the Government pledged themselves to have either unification or nationalisation, the dead hand of bureaucracy comes in both cases?—I think the Government has made a mistake.

10,834. We have some regard for scraps of paper in this country. If the Government has pledged itself to that and obtained the consideration with regard to the warding off of the strike in consequence of that, they must carry it out?—You admit by that statement that the Miners' Federation was holding the State to ransom.

10,835. I do not conceive anything.

10,836. If the Government made that pledge, there must be one or the other. You are clear that with a system of unification there would have to be a State control of the prices to protect the consumer?—I will say generally the State must protect the consumer if you destroy competition.

10,837. Therefore, there is the dead hand of bureaucracy combined with intermittent interference from the House of Commons on purely political grounds.

10,838. *Chairman*: If there is a combination of the coalowners, such combination would have to be controlled by the Government as regards prices. Is that what you say?—If you have such a combination as to destroy competition, then the State must interfere to protect the consumers.

10,839. *Mr. Sidney Webb*: Turn your mind to distribution. If you got your unified coal distribution in London which it is suggested would be desirable to encourage, similarly there would have to be State control, and you have in fact suggested it in one form?—I suggest you should have the analogy of the gas companies. I can hardly call that State control. Parliament passes an Act which continues to operate of its own accord.

10,840. The gas companies sliding scale involves not only an Act of Parliament, but absolute continuous control?—Yes, investigation of prices.

10,841. It involves an absolute audit?—Yes.

10,842. And involves a control over the companies?—Some.

10,843. The gas companies cannot issue capital as they like?—If the State passes a law it must enforce it.

10,844. It involves continual administration; there are officials whose position it is to look after the gas companies?—I call that investigation rather than administration.

10,845. They give orders. Has it been brought to your notice there are from an economical point of view some bad effects of those gas companies sliding scales. The gas directors are said to lose a great deal of their interest in economies—it is rather like the Excess Profit Tax—they get so little out of any improvement that they are not keen on making improvements. You never heard of that?—No.

10,846. You make a suggestion that a sliding scale of that nature should be applied to coal?—I knew before the war something of the Gas Light and Coke Company, and the directors were then studying improvements.

10,847. "It is imperative to preserve private enterprise." That is summing up your state of mind generally?—Yes.

10,848. You do not apply that universally?—As far as possible.

10,849. Do you apply that to water?—I think we did have as good a supply of water for London under the different companies as we now get by the Water Board.

10,850. Do you think it is useful to preserve private enterprise with regard to water?—I think private enterprise has served us well.

10,851. Do you think the town should rely on private enterprise for their water?—I do not see why not.

10,852. You think you would?—Yes.

10,853. That is going the whole hog. The opinion of the civilised world is against you upon that?—I am aware there is a large current of State Socialism to-day.

10,854. You do not say that is due to the Fabian Society?—Not entirely.

10,855. You rely very logically upon the stimulus of profit-making to induce the colliery owners to work their mines in the best possible way?—Yes.

10,856. Does it occur to you that all he is logically interested in is in the profits for the time being, and he has no interest in the nation's stock of coal. Do you think there is never any conflict between the interests of the present owners of shares and the permanent interest of the State for such things?—All through life there is conflict between the interests of the individual and the interests of the community.

10,857. Can you conceive any way in which the better interests of the community can be safeguarded than by the interests of the State?—The interests of the community are better served by people competing for private gain than by Government officials.

10,858. That is to say, to cut down the forest it is against the permanent interests of the community?—The alternative is to give the State ownership of the forests, which would mean an enormous expenditure with very little return.

10,859. In so far as the interests of the present generation conflict with the interests of the future community, you would still leave that to the profit-making of the private owner?—Generally.

10,860. We are to run a risk because you are afraid to interfere in the matter?—I think it is better to bear the losses we have rather than those we know not of.

10,861. You do not apply that to the coal in London?—I don't follow.

10,862. With regard to a coal trust, you would have the State intervene?—Where you see a particular evil it is well to seek a remedy for it.

10,863. You would allow the State to intervene where you see a particular evil?—Often that has to be done.

10,864. I think you are getting on. You say: "Experience shows that employees of all grades work better for private employers than for the State." That is a very general statement?—Absolutely true.

10,865. Do you think it applies to the Judges?—Judges have never worked for private individuals, so we have no means of judging them.

10,866. You know there used to be a great many people in magisterial offices such as Lords of a Manor, and from the manor over which they had private jurisdiction they received a profit?—My history does not go as far back as that.

10,867. You have forgotten that history?—Yes.

24 April, 1919.]

MR. HAROLD COX.

[Continued.]

10,868. You remember in the Army the work used to be carried on for the private profit of the contractors who carried the Army on?—I have heard of that and heard of that happening still.

10,869. You do not suggest an Army Officer works better for the contractors than for the State. You do not push it that length?—I think it is quite beyond the scope of any industrial problem to bring in a question of the Army.

10,870. It is only in the industry then. You do not mean employees of all grades; you only mean employees in industry?—The question of the Army is totally different. There is altogether a different human motive.

10,871. You can have a human motive and still have a stimulus with regard to profit making. Have you ever heard of the co-operative movement?—Yes.

10,872. Do you think they work for the stimulus of profit making; I mean those managers and the Committee men?—One hears stories about co-operative managers which are not nice to tell.

10,873. I do not ask you to tell me any gossip of that sort. Since you have admitted we have other springs of action than profit making, which are in the Army very effective, and, possibly, on behalf of His Majesty's Judges, there are other springs of action that are effective?—Yes.

10,874. You suggest they do not prevail in industry?—They do not prevail sufficiently.

10,875. Can you imagine that we might transform an industry from being a mere machinery for the making of profit into a public concern?—I see no sufficient change in human nature.

10,876. Have you not seen it done in your lifetime?—No.

10,877. Take the schoolmaster industry. When we were young we had private venture schools; now it is

a matter of public service. Do you suggest the schoolmasters are giving less loyal and devoted service for their salaries to the State than for private profit?—I really do not know whether you get better schoolmasters at public schools than at private schools.

10,878. A rather important example is the substitution of one motive for another motive?—Are public schools any better than private schools?

10,879. I do not say so. If you have not studied that particular instance, it is a relevant case which you might like to look at?—The case of a schoolmaster is the case of a wage-earner.

10,880. There was a time when a large portion of the schoolmasters were profit makers?—You mean they sold beef and potatoes to their pupils.

10,881. No, they were keeping schools for profit and taking the profits themselves?—There are a great many private schools still in existence.

10,882. I do not say how many there are. I suggest to you the industry as a whole has passed from being a private venture to being a salaried concern for the public. I ask you whether you thought in that transformation the motive, devotion and loyalty of the schoolmaster has been abated?—If you want me to say that I think there has been an improvement by the interference of the State, I say that is not so.

10,883. I ask, is the effect of the change a stimulus in those people?—I cannot follow you.

10,884. It is difficult to rise to a conception of a public service?—That is my experience of the mass of mankind, from Members of Parliament down to the lowest Government officials. They are thinking of themselves and not of the Government service.

10,885. Your experience has been unfortunate?—I find high Ministers corruptly using the money of the State.

(Adjourned to to-morrow morning at 10.30.)

SECOND STAGE—THIRD DAY.

FRIDAY, 25TH APRIL, 1919.

PRESENT:

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. ROBERT SMILLIE.

MR. R. W. COOPER.

SIR ALLAN M. SMITH.

SIR ARTHUR DUCKHAM.

MR. HERBERT SMITH.

MR. J. T. FORGIE.

MR. R. H. TAWNEY.

MR. FRANK HODGES.

MR. EVAN WILLIAMS.

SIR LEO CHIOZZA MONEY.

SIR RICHARD A. S. REDMAYNE (*Assessor*).

MR. ARNOLD D. McNAIR (*Secretary*).

MR. GILBERT STONE (*Assistant Secretary*).

MR. HAROLD COX, Recalled.

Chairman: I will ask Mr. Tawney to cross-examine the witness.

Mr. Leslie Scott: Sir, before the witness is further cross-examined, I want to ask your ruling on one point. Those instructing me have received a letter from the Secretary to the Commission asking that 100 prints of the *précis* of the evidence of witnesses

that it is proposed to call on behalf of the mineral royalty-owners should be handed in to the Commission in time for the Commissioners to read them in advance. Having regard to the fact that certain members of the Commission have made it quite clear that their minds are made up on the question of nationalisation, and that they—

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

Sir L. Chiozza Money: Sir, on a point of order, I must really protest against this interruption of those proceedings. You have called on Mr. Tawney to cross-examine the witness. Are we to have counsel, who have been specifically excluded by the Act, and by ourselves, appearing here to make speeches in which they reflect upon the Commissioners?

Chairman: I gather Mr. Leslie Scott's application has something to do with the *précis* of the witnesses' evidence. Perhaps if I might suggest it, I think it would not be wise to suggest that some members have made up their minds. Mr. Leslie Scott will know as an advocate, just as much as I know, that very often you think you have the jury dead against you, but, after all, they are Englishmen, and I think they are open to conviction. Even if some gentlemen, apparently—I do not even say they have apparently—have made up their minds, I am sure the arguments advanced will receive the most careful attention. With regard to your application, Mr. Leslie Scott, I gather it is something with regard to sending in copies of the *précis*.

Mr. Leslie Scott: It is, sir. The application I desire to make, and which Sir Leo Chiozza Money desires to prevent me making, is that the *précis* of evidence should not be sent in in advance in that way. It is not fair to the witnesses that they should have their proofs laid before the Commission a long time in advance in order that those to whom I referred just now may equip themselves with points which the witnesses are not able to deal with.

Sir L. Chiozza Money: On a point of order I do protest that that speech is another attempt to over-ride the decision of the Act as interpreted by this Commission and by yourself, sir,—that counsel are not to appear before this Commission. That was laid down not by ourselves but by the House of Commons in its wisdom, and we have, I think, properly interpreted the voice of the House of Commons in that matter. However that may be, the decision has been given, and I do protest against these interruptions on the part of counsel on matters which you, sir, are quite competent to decide for the guidance of the Commissioners.

Mr. Robert Smillie: I want to protest on other grounds. The time of this Commission is limited.

Sir L. Chiozza Money: Hear, hear.

Mr. Robert Smillie: There are some millions of people in this country who have as good a right to come here and raise points as Mr. Leslie Scott. If they are to come, I want to know where the Commission will end. I think we have quite sufficient to deal with.

Chairman: I am very much obliged to all three gentlemen for expressing their views, and I have no doubt we shall get on now. No doubt, Mr. Leslie Scott will let us have the *précis* in the morning on which he has the witnesses to be called and the *précis* can be handed round.

Mr. Leslie Scott: I will endeavour to arrange that that shall be done.

Sir L. Chiozza Money: I ask your leave to make one other observation, sir.

Chairman: Certainly.

Sir L. Chiozza Money: As you have allowed it to be uttered—I do not say you could prevent it—but it has been uttered, that certain people have had an opportunity of examining the evidence which others have not, may I point out that we have not yet received any schemes from the other side for examination ourselves, so that those economists who come before the Commission who are in favour of nationalisation have had no opportunity of examining the other side's views, while gentlemen well qualified to do it, like Mr. Harold Cox, who is now before us, have had an opportunity of criticising in detail the case for nationalisation as presented from this side by various people. I only want to make that observation, which otherwise I should not trouble you with, because counsel has, as I think, abused his position here to make remarks which amount to an

appearance before us which we ourselves have not desired and, indeed, intend to prevent.

Mr. Arthur Balfour: Sir, I am sorry to take up the time of the Commission, but it does not seem to me that we have from the other side a definite scheme which we can criticise. Various schemes have been thrown out, and a scheme from Mr. Straker, the miners' representative, has been repudiated. I think it would be well to have from the other side a scheme which we could consider.

Mr. R. H. Tawney: I will not traverse Mr. Leslie Scott's statement about the Commissioners having made up their minds, because it is not a kind of statement worth discussing, but should not have been made on the one point about the *précis* being sent in.

Mr. Leslie Scott: On a point of order, would you refer to paragraph 3 of the First Report signed by Messrs. Smillie, Hodges, Herbert Smith, Tawney, Sidney Webb, and Sir L. Chiozza Money, in which they say: "We think that, in the interests of the consumers as much as in that of the miners, nationalisation ought to be, in principle, at once determined on."

Mr. Robert Smillie: Our side will have to retire from this Commission if outsiders like Mr. Leslie Scott are entitled to be heard. There is nothing for us to do but retire. We cannot sit here and allow that.

Sir L. Chiozza Money: Hear, hear!

Sir Allan Smith: I suggest this matter ought to have been discussed *in camera*.

Sir L. Chiozza Money: No, in public.

Chairman: At present Mr. Tawney is making an observation.

Mr. R. H. Tawney: May I return to my point? In spite of what Sir Leslie Scott says—I go so far as to say I am even familiar with the Report which he has read—I am still wishful to have as long an opportunity as possible of considering the evidence put before us, and I submit that that is a perfectly proper attitude. The only proper attitude, and the only way in which we can do justice to the evidence is to have an opportunity of reading it in advance. I have given evidence before Royal and other Commissions, and the procedure in my experience always was for the Commissioners to tell the witness that he must send in a proof of his evidence some considerable time in advance, in order that the Commissioners might consider it. Now that is the reasonable procedure. It is a procedure which makes on the whole for fairness and for the discovery of the relevant facts, and I would ask you if we cannot pursue that procedure now.

Chairman: Mr. Leslie Scott, I understand, does not want to give his *précis* in at the last moment, but he will let us have it as soon as he possibly can. I do not suppose at the moment he has his *précis* ready. There is this to be said: Supposing it turns out that Mr. Leslie Scott hands in his *précis* at the very last moment, and any gentleman on either side says: "Well, I have not had an opportunity of reading this, and I really cannot ask questions upon a *précis* that I have only just seen a moment ago," under those circumstances I shall exercise my function as a chairman and say: "I shall have the witness recalled after a duo interval."

Mr. R. H. Tawney: Thank you, Sir; that quite meets my wish.

Sir L. Chiozza Money: I am sorry to speak again, but I must really ask whether interruptions of the character which Mr. Leslie Scott has just made are to be permitted. If so, I must respectfully intimate my intention of retiring from this Commission.

Chairman: Thank you. Now we will continue with Mr. Tawney's cross-examination of the witness. We have only occupied a quarter of an hour on this discussion.

10,886. *Mr. R. H. Tawney (To the Witness)*: If I may make a digression in the direction of the subject, I do not propose to follow you into some of the

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

larger questions which you have raised about the nature of Parliament and the character of Mr. Webb and Karl Marx, and so on. I gather, and I think rightly, that you are a strong advocate of private enterprise?—Yes.

10,887. And on page 7 of your typed proof you give a list of the various achievements of private enterprise?—In that particular field.

10,888. Yes, in that particular field. You say: "In the 50 years ending 1902 the death rate from accidents among miners dropped from 5 and 6 per thousand to 1 and 2 per thousand, and the death rate from all causes was reduced by more than half." Then you go on to mention certain other improvements, and then you say: "All this has been done by private enterprise, without any assistance from the State." On reconsideration would you not desire to qualify that statement a little?—No.

10,889. Does it not occur to you that the reduction in death rate from accidents has been partly due to the action of the State?—The statement here that all this has been done without assistance from the State refers to development on the technical side.

10,890. It does not refer to the accidents or reduction in death rate?—It was meant to refer to that. I should not have used the word "assistance." I quite recognise that the State has a compulsory power and a governing power which it has quite properly used both in factories and mines to establish a standard with regard to accidents.

10,891. That is to say, the reduction in the number of accidents, as you point out quite rightly, is not simply due to the action of the owners, but due partly to the action of the Legislature?—I think quite rightly that is a general view of the function of the Government, and the function of the Government is to govern.

10,892. I only want your view of the facts. This particular improvement is due partly to the State, is it not?—It is due to the State exercising its proper functions as a Government.

10,893. Do you know how many Acts dealing with the safety of miners have been passed? The first Act was in 1842, was it not?—You may be right.

10,894. I am speaking without pretence to accuracy, but I think it would be moderate to say it is not less than eight?—May I submit that this is really beside the point? I do not challenge the power of the State to take governing action, by which I include such things as the Factory Acts and the Mines Acts, and so on, but I challenge the State taking commercial or industrial action.

10,895. As you know the distinction is not always very easy to draw in practice, but I think you will see the relevance of this, if I may go on. Is it within your knowledge that when these Acts were still Bills a considerable number of them were strenuously opposed by the coalowners in Parliament?—It is quite probable.

10,896. But you have not any personal knowledge?—No, but it is quite probable.

10,897. You have not read the history of the legislation?—I have read more or less the history of the Factory Acts, and I know they were opposed by employers very largely.

10,898. You know, perhaps, Professor Jevons' book on the coal trade?—I remember reading it years ago.

10,899. I do not mean the elder Jevons, but the son?—No, I have not read it.

10,900. I think if you will consult the history of it again you will see that strenuous opposition was offered?—What is the point of that, quite?

10,901. That when the State has endeavoured to enforce a higher standard of safety with regard to miners it has come into collision with parties who have financial interests in preventing that standard being enforced?—Quite so, but I do not see what that has to do with the question of the State becoming actively an industrial factor.

10,902. I might retort that the reduction of the death rate has nothing to do with that. You raised the point and not I. Has it occurred to you that supposing the State, instead of being an external authority interfering from time to time, were itself owner of the mines, it might be able to make further advances in the direction of securing greater safety?—I think the chances are against it, because you would at once get two different State Departments quarrelling with one another. That is one of my arguments for keeping the State out of industry: I want the State to be a neutral acting outside, but keeping the authorities and the rest of us in order.

10,903. You mean the Home Office, through the Mines Inspector, might come into collision with the Board of Trade, or whatever the Authority was, for managing the mines?—Yes, that is exactly my point.

10,904. As you are aware at the present time it is not always very easy for the Home Office to enforce regulations with regard to safety?—That is a matter for Parliament.

10,905. Quite so, but is it not probable that, if a Minister were liable to be hauled over the coals in the House of Commons whenever there was an accident, a higher standard of safety would be enforced?—I think it is improbable. I think you get more efficient action by the State when it is acting from outside.

10,906. You make some statement with regard to the rarity of the gift of industrial and commercial management, and you go on to say that is the reason why managers command high salaries. Have you any knowledge what salaries managers do command?—Only generally.

10,907. Do you know colliery managers are now agitating for a minimum of £500?—I was not speaking specially of colliery managers but generally of managers throughout industry: I was dealing with the general proposition.

10,908. Of course I accept that statement, but I think if you look at the preceding statement you will see, if I am mistaken, that the mistake was natural: "When, however, it is suggested that the average miner, or the average citizen of this or any other country, is competent to share in the highly technical and elaborate work of managing a mine, and organising the sale of its produce, I demur"?—Yes, but you were using the word "manager" in a more limited sense than I was. A great deal of the management in the mine is done by the proprietors of the mine.

10,909. By the "proprietors of the mine" do you mean the shareholders?—I mean to say it is not simply the particular person. I mean the industry is also conducted partly by the people who are financially responsible for it.

10,910. When you speak of the proprietors of the mine, I suppose they are the shareholders?—I meant the directors. That is a slip of the tongue.

10,911. I will not take advantage of a verbal slip. If we may start from that, it raises an important point of principle, does it not? Let me pursue it a little further. In another part of your paper rather an analogous point, I think, occurs. You say, I think—forgive me if I do not quote you correctly—that self-interest compels the different parties interested in industry under private management to work for the good of the concern. I think you say something like that?—Yes.

10,912. Does it really apply to people who own the property to work for the good of the concern: for example, does it apply to shareholders?—To the directors. The shareholders simply look on from outside.

10,913. Quite so, the shareholders look on from outside and are important only because they are paid a dividend?—Yes. The directors are responsible to them for the production of a dividend.

10,914. It would be possible, I suppose, to get rid of the shareholders who simply "look on from outside" without in any way diminishing the incentive to the efficient conduct of the industry on the part of

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

those who do conduct it at present?—If you get rid of the shareholders you get rid of the capital.

10,915. Would you? When you get rid of the capitalist do you get rid of the capital?—How are you going to accumulate capital?

10,916. There are several possible ways, are there not? You might possibly save it out of the product of the current year?—How do you mean save? —

10,917. The community might save?—Yes, but how?

10,918. It might lay aside a certain surplus?—That is by taxation.

10,919. Not necessarily at all; though, of course, it might save by taxation. Supposing a municipal tramway wishes to extend, it may borrow or, presumably, it may raise it out of the rates—although it never does—or lay aside a certain sum out of the takings of previous years?—It is conceivable.

10,920. It is conceivable, and it is possible. All I want to get at is this. It is not a mere verbal point, and I do not wish to make a score about it. It is often said the importance of private enterprise is that it offers a stimulus to efficiency and management, and I myself should go so far as to admit that that is a very weighty argument and one which should be met, but it does not really apply, does it, to all aspects of private enterprise? I mean, there are several parties interested in a concern. Assuming that, to some of them private enterprise offers a stimulus; to others, the shareholders, it does not, who, as you say, look at it from outside?—Yes, but they provide the capital.

10,921. Yes, but they do not conduct the industry?—No, but they provide the capital without which the industry could not be conducted.

10,922. That is to say, their function is merely to provide capital?—It is very important. I should not use the word “merely.”

10,923. Their function is to provide capital and to be paid for it. If it were possible to raise capital otherwise, you would not impede the efficiency of the industry?—I think the best conceivable way to raise capital is to leave it to private individuals to save their money and invest it.

10,924. You criticise the Post Office, with regard to which I am not competent to follow you, but I should like to get clear from your view. On page 5 of your proof you say: “The experience of the telephones, though not quite so bad as the telegraphs, equally shows that the State fails to make a profit where private capitalists succeed.” Do you suggest that the failure to make a profit is always a proof of inefficiency?—It is partly due to inefficiency and partly to Parliamentary interference.

10,925. Do you suggest the fact that a privately-managed Post Office might make a larger profit than a publicly-managed Post Office is conclusive on the side of private as against public management?—I do not quite see the point of your question.

10,926. I understand you to say your criticism is that certain State Services have failed to make a profit where private enterprise in those Services might have succeeded in making a profit?—Yes.

10,927. Do you suggest that the fact that profits might be lower under public than private management is conclusive against public management?—It is a strong argument against it.

10,928. Are there not some Services which it might be worth while to conduct even at a loss?—Which are they?

10,929. For instance, the provision of roads or the provision of schools?—I think there is a great deal to be said for making even the users of roads, such as motorists, pay for the use of them.

10,930. Do you suggest the roads ought to pay for themselves?—I think, on the whole, the present system is better, but we should never have got our present roads they had not begun by paying for themselves. Practically every road in England at the present time is due to private enterprise.

10,931. That is to say, in the early stages of developing an undertaking private enterprise might be eminently desirable, but within a time, as in the case of roads, it might be desirable to revise that method at a later stage?—I admit that as a general proposition.

10,932. Then with regard to this point about profits—again, I must apologise if I have not your exact words—I think you say the only part of the Postal Service which makes a profit is the delivery of letters, while the telegraphs and so on make a loss. Is that really so very severe criticism upon it? Is it not the case that even in a private business, taking shop-keeping, it may pay to sell one line at a loss and make a larger profit on other lines? That is common practice, is it not?—Yes, but the Post Office did not set out to do that, but to make a profit on telegrams and failed, and they set out to make a profit on telephones and they failed.

10,933. But it may have changed its mind, might it not?—No, I think it was due to bad management. It was also due to the fact that workpeople employed by the State work less efficiently than people employed by private persons.

10,934. You say it was due to bad management, and, of course, it may have been, but I see nothing in your paper to produce any evidence about that?—Well, I cannot go into the whole matter, of course.

10,935. Is it not the case that most of these cases are questions of evidence? We do not want to argue in the air?—The main fact is that they promised a profit which they have not delivered.

10,936. When did they promise it?—They promised a profit for telegraphs in 1870.

10,937. That is 40 years ago?—Which they failed to deliver after two years.

10,938. Do you seriously suggest that the State or public undertaking has no right to revise its financial or commercial policy?—It was not intended to revise it. There has never been any distinct statement on the part of the Government that they meant to carry telegrams for less than cost price.

10,939. I suggest the material question is not whether the State has changed its method, but whether the method now adopted is a sound method or not?—I think it is very unsound that I should be allowed to send a telegram partly at your expense.

10,940. I am afraid I cannot agree with you. I am delighted that you are able to do it, and hope that you will take every advantage of it. With regard to the miners, I see on page 15 you speak, to begin with, of the pamphlet called “The Miners’ Next Step.” That pamphlet was produced in 1911, was it not?—Yes, I think that is the date.

10,941. Was it an official pamphlet on the part of the Miners’ Federation?—It was published by the Unofficial Reform Committee. I stated that in my evidence.

10,942. What exactly is your object in bringing forward this pamphlet produced by an unofficial committee eight years ago?—To show there was a difference of opinion among miners.

10,943. Is it really relevant to the demands which are now being put forward by the Miners’ Federation?—Certainly, because it shows there is a body of miners opposed to those demands.

10,944. There was eight years ago a group of miners who, before the miners’ recent programme had been produced, held rather different views. Is that really relevant?—I think it is most relevant, unless you suggest the miners change their views every eight years.

10,945. I suggest one reason for mentioning it was *ad invidiam*?—In what way?

10,946. In order to create the impression that the Miners’ Federation produced this programme?—No, I say it is proof that a body of miners are opposed to the proposition put forward by the Miners’ Federation.

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

10,947. You must not say "are," but "were?"—Yes. I have no evidence later than that of eight years ago.

10,948. Possibly that is so eight years ago. Now the circumstances to which I should like to draw your attention are these. You speak of this pamphlet and you say: "This amounts to a claim that the miners are to be allowed to treat our greatest source of natural wealth as if it were their private property." I daresay it does. Does that mean you think our greatest source of natural wealth ought not to be treated as private property?—Their proposition is in conflict with the proposition of the State Socialists. That is all I meant.

10,949. This sentence is not a criticism on the proposal?—I do not quite know what you mean.

10,950. You quote the proposal and go on to say that these proposals amount "to a claim that the miners are to be allowed to treat our greatest source of natural wealth as if it were their private property"?—Yes.

10,951. Is that system a criticism on the proposal? That is all I wish to know?—It is a criticism so far as the miners represent a single corporation.

10,952. Does that mean that you do not think our greatest source of natural wealth ought to be treated as private property?—Not by a single corporation.

10,953. That is to say, you would be against any forms of combination?—Unless it were limited to very small areas.

10,954. You are not in favour of any national combination, either of workers or capitalists?—I am absolutely opposed to it.

10,955. *Sir L. Chiozza Money*: If I may say so, I thought your evidence very interesting, and I should like to ask you some questions about it. At the conclusion of our proceedings last night, in answer to Mr. Webb, you indicated your opinion that officials, whether in the Government or as Members of Parliament, down, I think you said, to the lowest public official, are thinking of themselves first and not of the public service?—Yes.

10,956. Is that your considered opinion?—Yes.

10,957. Do you mind if I ask you, then, whether you have had any occasion to see the servants of State at work during the four years of the war?—What I meant by that was that officials in the public service, like all human beings, are primarily dominated by the motive of self-interest.

10,958. That is not the question I asked you. Have you had an opportunity of seeing those gentlemen at work upon whom you reflect in rather severe terms?—I have also seen many people in private work—

10,959. Forgive me! Have you seen them at work?—Both in public and private work and throughout the war a great many people have worked much harder than before the war.

10,960. Have you actually seen Civil Servants, in particular, in our great public Supply Departments, the War Office, the Admiralty, the Ministry of Shipping, the Ministry of Food and the other offices, who were concerned with the direct administration of the war; have you seen them at work or have you been working with them?—No, I have not. I know many of them have worked extremely well, if that is what you wish me to say.

10,961. May I suggest to you, therefore, that your phrase is a little too sweeping and somewhat unjust?—The point I wanted to bring out was that people in Government service are necessarily looking at the problem largely from the point of view of self-interest, as every human being has to do, and the motive of self-interest in public service works against the common interest, whereas in private service it works for the common interest.

10,962. May I suggest to you that the whole experience of the war has demonstrated that your thesis is not tenable. May I ask you if it is within your

knowledge that Civil Servants in these terrible four years have initiated original ideas, have initiated original policies, and have carried out the administration of work with such extraordinary ability as not only to commend their work to our own Government, but to foreign Governments, and also to the business men who have been associated with them in that way? Is that within your knowledge?—It is within my knowledge that there has been a much higher standard of public service during the war, which, again, is due to a fundamental human instinct, the love of a fight.

10,963. Is it not the fact that these same civil servants performed equally good services before the war in a more limited sphere?—The standard was much lower before the war, and will be much lower after.

10,964. If you take the gentleman, for instance, who carried out our admirable rationing schemes, which were such a success?—I can only smile when you say that.

10,965. I do not think you would smile if you knew as much about the subject as I do. May I suggest the gentleman who carried out what I call our extraordinarily successful rationing scheme?—Are you referring to the rationing of coal?

10,966. Forgive me! Of course, I do not object to your interrupting my question. I do include coal?—May I give you an illustration from Leeds?

10,967. Will you allow me to complete my question?—Yes.

10,968. Are you aware that this gentleman who carried out the rationing of food was just as competent a Civil Servant before the war, and before the war began he was a gentleman who carried out work which in a different scale was quite as successful?—It may be.

10,969. But is not that entirely at variance with the opinion you have expressed?—No. I was laying down the general proposition, and your particular cases do not refute that.

10,970. When the war broke out we found ourselves, through the neglect of private capitalism, in such dire straits that we nearly lost the war, and the whole thing had to be pulled together by a limited number of Civil Servants with a number of outside men called in to their aid?—No, I believe if it had not been for the great wealth which private capitalism built up we should have lost the war.

10,971. Are you aware that when war broke out we had not even zinc for cartridges?—It may be. I am not in a position to refute or to accept your statement.

10,972. As I sat on a Committee which dealt with it, I am only too painfully aware of it. Are you aware that we had not enough steel to go round?—You seem to have got to the limits of my knowledge of these details.

10,973. I am sorry to press you on these things, but you have expressed some very strong opinions here. I have a great respect, of course, for your intelligence, if I may say so, and I know that you will agree that opinions ought to be based upon a precise knowledge of facts, and that is why I put the facts to you so as to test your opinions. I ask you again, are you aware that when the war began we had not enough steel to go round?—It is quite possible that as the nation had not been looking forward to war, it was unprepared for war. That applied to the Army as well as to the industrial services of the country.

10,974. Are you aware that trade neglect by capitalism was not only with regard to war trades, but peace trades? Steel was wanted for peace?—I am not prepared to accept your statement that people engaged in the trade had not looked ahead and had not enough steel for peace requirements.

10,975. I called attention to it two years before the war and one year before the war in articles which had a large circulation in the north of England and

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

excited a great deal of attention at the time?—Do you suggest the manufacturers did not read your articles?

10,976. Some did and some did not, and the war proved there was not enough supply?—The war proved there was not enough steel for war requirements when no one anticipated war.

10,977. But these trades were not only for war but for peace?—But what you do not prove is that the provision for the peace requirements of steel was inadequate. You have not the means to prove that.

10,978. We have this, that we were falling so behind in steel production that we were a bad third in the steel production of the world?—That raises all sorts of questions about the supply of German iron and all sorts of things, which are quite a different issue. You might get into the Tariff Reform issue over that.

10,979. Yes, but we do not want to do that. Take a thing essentially connected with capital: the by-products of coal are valuable, not only for peace but for war; they branch off from one stem, which stem, if attended to, gives you industries for peace and gives you industries for war. The stem was so neglected that in peace we had not the dye industry and in war we had not the explosive industry, which was directly related to it. Is that a proof of the efficiency of capitalism in this country?—It proves capitalism was concentrated on other things, and you, who used to be a Free Trader, would probably say they were right.

10,980. While I was a Free Trader I pointed out that these things were wrong?—I think it is a matter of argument whether it is better for the country to leave an industry to another country or conduct that industry itself.

10,981. You will allow me to use my own phrase?—word "neglect."

10,982. You will allow me to use my own phrase?—But I will not accept your word "neglect."

10,983. No, I am afraid we differ about that. I say these deficiencies being revealed, is it not the fact, to take the chemical industry, that one of our cleverest scientists, Lord Fletcher Moulton, was put at the head of the Explosive Supply Department and given the assistance of other scientists, and in two years they built up a magnificent explosive industry?—It is the case that the impetus of war brought out a tremendous volume of knowledge from the country which had not previously been used.

10,984. And that was done under State auspices by the very officials whom you denounce here?—By people trained to private enterprise.

10,985. Lord Fletcher Moulton was a judge and an official?—Quite so, but he had also the private training of a barrister.

10,986. One of the very gentlemen whom you condemn was an official, and he was the head of this Department?—He happened to be.

10,987. And you say every official is necessarily in effect a "waster," thinking of himself and not of the public, which is worse than a waster?—That is true of the average official.

10,988. No; you said from the Prime Minister down they were all bad?—I think the average is lower than in private life.

10,989. Are you aware that Lord Rhondda, who was a first-class business man, when he was at the Ministry of Food, found he could get plenty of business men, but he complained he could not get enough Civil Servants?—If you are to run a department, you want men trained in that department.

10,990. He wanted administrators to administer the food of this country?—Well, what has that to do with coal?

10,991. It has a good deal to do with it. The point and the main issue which concerns the public is whether industries can be successfully conducted by persons elevated to the position of public responsibility. That is the issue. You in very strong language say that is impossible?—I say you get better results by the methods of private enterprise.

10,992. I think I have shown you in industry after industry that private enterprise left us without these industries?—I deny that.

10,993. That is a matter of fact, and we were exposed to the gravest danger?—I deny that our industries before the war were in the aggregate in a bad condition. They were in a very fine condition.

10,994. Is it your point that the war made all the difference to the private individual and changed him into a different sort of being?—Certainly; war does that.

10,995. Are you aware during the early years of the war private individuals in charge of important trading concerns sent out of this country tea, fats and other things, which were wanted in this country, to such an extent that we were brought into a position of grave danger?—I am quite aware that private motives sometimes work against the public interest, and that is why the State must intervene as a governing body.

10,996. Are you aware that private interests sent tea out of this country in such a way, as appears from the Board of Trade returns, that we were driven to pay 4s. or 5s. a pound because of what they had done, and some of that tea went to the enemy?—I am not aware that it went to the enemy.

10,997. I have reason to know that because I served on the Blockade Committee. Take fats: Are you aware that fats had to be rationed in this country because of the neglect to store fat which had been brought into this country by British ships, and which had been sold out to the Continent by British merchants?—It is easy to make these statements, and I have no means of correcting them.

10,998. You have stated strong opinions, and therefore I submit I have the right to ask you on what basis you make those statements?—You are not asking me questions, but making statements which I say may or may not be true.

10,999. At any rate, if they should happen to be true, you would be wrong?—No, not necessarily. They would not affect my general proposition. There are exceptions to every general proposition.

11,000. Now let us start at the point you started with. You said the country would be as badly off with Government standard coal as it was with Government ale and Government tea. Let us take Government tea first. Do you know how Government tea arose?—this is your own example and not mine?—I should think it arose largely from the desire of the Government to make people uncomfortable.

11,001. I thoroughly appreciate the humour of what you say, but there is more than humour engaged here, and let us consider tea, which is not always a humorous thing. Do you know that tea rose in price in the shops from 4s. to 5s. a pound, and do you know we had very great difficulty in getting it even at that price?—I am not sure it would not have been better to let the price rise and let the thing adjust itself.

11,002. That is individualism. As a matter of fact the public were very discontented with tea at that price, and the grocers said it would go up to 7s. 6d. a pound. Have you any doubt that it would have risen to that?—I do not know what price it might have risen to.

11,003. It got to between 4s. and 5s. a pound, and it was still rising?—It may or may not have been, but I think the idea of blending different qualities of tea was perfectly absurd.

11,004. You have a logical mind enough to know that that is not an answer to my question. Do you know that caused Lord Rhondda to interfere, and with the aid of the Shipping Ministry to bring down the price of tea from 4s., which was the price at which it was sold by private enterprise gentlemen, to 2s. 8d., and do you know that that is how Government tea arose?—I also know no one liked standard tea.

11,005. Do you know that the shortage was partly, if not wholly, overcome by forming a store of tea, which private interests had not formed?—I have no means of checking your statements.

11,006. For such strong opinions as you have expressed you have very limited acquaintance with the facts relating to the war?—I have very limited acquaintance with the statements you bring forward.

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

11,007. But these facts which I have given you have been before the public for more than four years?—That may be, but I came here to give evidence on the subject of coal.

11,008. But you yourself referred to the subject of tea?—Simply as an example of what was unpopular with the country.

11,009. Why should you reproach me with referring to tea?—Because you are going on a different issue with regard to tea. I say standard coal will probably be as unpopular as standard tea.

11,010. Now take Government ale. Do you know how that arose?—I do not in the least know, and I do not see in the least that it is relevant to the question of coal.

11,011. Then why put it into your proof?—I merely say that standard coal would be as unpopular as standard tea or standard ale.

11,012. Is not that rather an attempt to tickle the ears of the groundlings?—Probably.

11,013. It is not an argument which ought to be addressed to a serious Commission of this kind?—Yes, it is. I think it shows that when you standardise things you get a result which people do not like.

11,014. You are making an illogical contrast. You are comparing Government ale in time of war with Government standard coal in a time of peace, and they are things which are dissimilar in standard, time and quality and every other point?—No. We may have been compelled during the war to put up with standard tea or standard ale, but you propose to make standard coal a permanent institution.

11,015. Do you suggest there is any proper comparison between coal in peace and ale in war? I ask you again, do you know how Government ale in war arose?—No. I think my point is fairly clear. What I say is, that standard tea was unpopular and standard ale was unpopular, and you propose to make standard coal permanent.

11,016. But the point of it is that your comparison was a comparison of peace conditions with war conditions, as when you compared the figures written in that pamphlet, which was written for peace conditions, with the conditions of 1919, several years after it was written?—No; will you allow me? I say whether it was necessary or not standard tea was unpopular and standard ale was unpopular. It may have been necessary during war-time, but you propose to make standard coal a permanent institution in peace-time.

11,017. That has no relevance to the question before us. May I remind you that the standard ale had to be made weak so as to conserve the grain of this country; that is to say, we had deliberately to make the beer poor in order that there might be bread enough for the people of this country. Do you not think that that was a proper thing for the Government to do?—It may have been, or it may not, but the point is that the people did not like it.

11,018. If it may have been a proper thing for the Government to do, then why sneer at it?—I say the people did not like it.

11,019. As an intelligent man, do you use it as an argument against standard coal in the times of peace?—All I say is that there are two things which the public did not like, and you propose to follow that example.

11,020. I am doing nothing of the kind. I suggest to you that your comparison of the standard ale, which was brought about by a shortage of grain, has nothing to do with it?—Then you withdraw the proposition that we should have standard coal?

11,021. I suggest to you that you should withdraw your comparison. Will you not do so?—No, I do not.

11,022. On page 15 of your précis you are rather severe upon the Miners' Federation?—Yes.

11,023. You talk about them holding the State up to ransom?—Yes, I do.

11,024. In an article that was published in the "Sunday Times," I see you were equally severe?—Probably.

11,025. I have before me the article that you wrote to the "Sunday Times" on March 16th. You say

that the miners "ask for 30 per cent. increase in wages for a much reduced working day. Their present wages, Mr. Lowes Dickinson states, come to £157,000,000 for the year, 30 per cent. on that figure, apart from additional cost due to the reduction in the working day, represents £47,000,000, or more than the whole sum calculated to go in profits and royalties." Do you maintain that statement?—I worked the figures out at the time, and I think they are accurate.

11,026. There I am afraid you are not quite well acquainted with the facts. The miners did not ask for an increase of 30 per cent. on the whole of their wages?—Surely their demand was for 30 per cent.

11,027. They did not ask for a 30 per cent. increase on their wages. They asked for 30 per cent. on their earnings apart from the war wage, which was 3s. a day, which makes an enormous difference to your calculation?—I am very glad to hear it.

11,028. Then probably you would like to alter that statement?—I will at the first opportunity. That was the popular statement of their demand: 30 per cent. increase on their wages.

11,029. Yes, but we look to Mr. Harold Cox to give us something more than a popular statement. I want now to pass from that to the question of the telephones. You stated again and again that the Post Office, apart from the mere carrying of letters, is a bankrupt concern?—I do.

11,030. I have here the official figures of the Post Office?—For what year, may I ask?

11,031. This represents the year 1913-14, the last pre-war year, which seems to be the last fair year to take into account. Are you aware that the Post Office service in that year earned over 4 per cent. on the telephone service taken by itself?—That was after losing the royalty which the telephones had previously paid.

11,032. You said it was a bankrupt concern, and I must ask you to adhere to the point I put to you. You said it was a bankrupt concern apart from the carrying of letters. May I ask, is a concern bankrupt when it pays over 4 per cent.?—The telephones had only been a short time in the possession of the Government then. They have gone worse since then.

11,033. That applies to a great many industrial undertakings during the war unless they profited at the expense of the public, which the telephones have not. You and I, serving on a Retrenchment Committee, advised the Government to raise by one penny the price in the call office, and they took our advice, but apart from that you know that the telephone service has not profited at all at the expense of the public?—You misunderstood me. I was not referring to the effect of the war. My point is that the telephone service is progressively getting worse and worse.

11,034. I am sure you were not aware of those figures when you wrote this paper, and I have given you that opportunity to correct that error. I will repeat what I said. According to these figures, which are supplied by the Post Office itself, the amount available for dividend in the commercial sense is over 4 per cent.?—Is that the special commercial return that you have before you?

11,035. This is a special account got out for this Commission?—There are two kinds of Post Office returns, one giving the Parliamentary return and the other the commercial statement.

11,036. Are you aware that when the National Telephone service was taken over wages were raised and pensions were increased?—Yes.

11,037. If the Post Office were now paying the old, or as I should like to say, the inadequate pensions and the inadequate wages of the old days, the dividend would not be 4 per cent., but 7.29 per cent., so that the workers have got more wages while the public have not had to pay more for their telephones?—You overlook the fact that before the telephones were taken over, they were paying a very large and increasing royalty to the State which has now been wiped out.

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

11,038. Are you also aware that the National Telephone Company, when it was going to be taken over, took the course of allowing all its plant, etc., to be run down, so that when the Post Office took it over it was not in a good condition?—That may have operated to a certain extent.

11,039. Do you know that the Post Office had to set to work and instal new plant, and that that operation was interrupted by the outbreak of war?—I do not know that.

11,040. Then might I suggest that you would want to amend the statements you have used?—No, I adhere to those phrases.

11,041. Then the Post Office, you say, is a bankrupt concern although it pays 4 per cent. on the telephones?—What I say is that the State has lost by taking over the telephones.

11,042. May I take you from that point to three different places where public enterprise is practised? The places I refer to show different types of nationalisation. The first is Australia. Have you had any opportunity of examining the accounts relating to the national enterprise of Australia and New Zealand?—No.

11,043. There again, is it not a little unfortunate that you should express such a strong opinion without examining these easily available facts?—One cannot examine all the facts in the world.

11,044. I have a very good collection myself?—There are people who are exceptional.

11,045. Surely it is the duty of people in your position not to tell the public things that are wrong?—I try not to tell them things that are wrong.

11,046. If you will turn to page 635 of the Official Year Book of the Commonwealth of Australia for the years 1901-1913, are you aware that the whole of the Commonwealth railways (and it does not refer to one State alone, because it includes New South Wales, Victoria, Queensland, South Australia, West Australia, and Tasmania) make a profit, over and above finding the whole of the interest on the capital?—I am also aware that a great many of the railways in Australia were built for political reasons.

11,047. Is it not then all the more remarkable that they should pay?—No, there is a sheer loss to the community.

11,048. Let us see whether, for instance, New South Wales was a case of a railway built for political reasons?—Yes.

11,049. Do you know that you can go 50 miles on the New South Wales railways for 2s. or less than a halfpenny a mile?—That may be so.

11,050. And that in spite of the political pressure on the railways?—It may be.

11,051. Would it not be advisable to have a little of that political pressure here?—It does not in the least follow that we could build railways as cheaply here.

11,052. Now let us turn to New Zealand. I find that the net revenue of the New Zealand Railways for the fiscal year 1911 is £1,990,000, and the percentage on the capital cost is £4 ls. Are you aware of that fact?—You might read out thousands of facts, and ask me if I was aware of them.

11,053. I am putting it that all these facts are so inconsistent with your strongly expressed opinions. You have expressed yourself in your paper in a most downright way, there are no bones about it in your paper?—There are not intended to be.

11,054. What you mean is, putting it shortly, that public enterprise is always unsuccessful?—No, what I say is that private enterprise is in the main better than public enterprise.

11,055. I am giving you all these facts, and I think I am perfectly relevant. I am putting them to you to show you that your opinion wants revising?—Not at all. If I had the time to go into all those facts, I could still maintain my proposition.

11,056. I think you would have great difficulty in doing so. Now I am going to turn from what I may call democratic colonies, and I turn to Ceylon: Are you aware that in Ceylon the Government owns the railways, the harbour, the docks, the salt industry, the forests, the pearl fisheries, the distilling of alcohol

and other things, and as the result of that there is such relief from taxation that an income of £1,000 a year pays only a tax of £6 lbs.—I have no means of checking your figures.

11,057. I am pointing out that the experience of Ceylon is not in accordance with the opinion expressed in your paper.—If it is worth while to go into it, my answer would be that in Ceylon you have an intelligent body of Civil Servants imported from England dealing with a really backward people, and you may get good results, especially as there is no parliamentary control.

11,058. These are public officials who, according to you, are thinking of themselves first.—In a case like that their private enterprise does not conflict with their public interests.

11,059. It seems to show that there are some little reservations to be made in your opinion?—I think there are reservations to be made in everybody's opinion who wants to be fair.

11,060. As I am sure you do. Now, shall we turn to an enemy country, and let us take Germany. Are you aware that there, under an exceedingly bureaucratic Government as compared with the largely democratic Governments we have been considering—take Prussia, for instance—are you aware that half the revenues of Prussia were received from the State railways, forests, mines and other industrial undertakings, and that the State Departments of Prussia were one of the most successful cases of State enterprise?—That does not in the least destroy my general proposition, which is that private enterprise is more efficient than public enterprise, in the main.

11,061. Now shall we come to London and take the electrical undertakings of London: is it within your knowledge that the publicly-owned enterprises of London, as compared with the privately-owned electrical enterprises of London, give the public a cheaper service and yet pay their way?—No, it is not, but it is within my knowledge that one of the greatest desiderata of the present time, namely, the amalgamation of electrical concerns is blocked by the municipalities. They are opposed to having their own concerns taken away from them.

11,062. Are they not opposed to the formation of great trusts, the very thing that you are opposed to?—No, they are opposed to having their commercial concerns taken away from them. That is the case in Lancashire, as I know for a fact.

11,063. I think you will find on the whole that the great opposition is to the formation of trusts.—On this point I can correct you. The opposition comes from the municipalities, each municipality wanting to keep its own show.

11,064. Is it not the case that that opposition somewhat arises from their own success in managing an undertaking of that size?—It may be: it arises, I think, from the feeling of municipal pride.

11,065. We are going to have here some of the engineers from those concerns, and it may be a pleasure to you to read their evidence?—It will, no doubt, be a pleasure to me to read your cross-examination.

11,066. With regard to the typical equipment of the mines, and the other matters you refer to, on one of the pages of your memoranda you refer to a number of things which we owe to private enterprise. With regard to the mines managers, you said to Mr. Tawney that the capitalist engaged in the mines had a direct share in the management of the mines very often?—Through the directors, I said.

11,067. Are you not aware that the Mines Acts throw a direct and personal responsibility on the manager of the mine, technically so-called, which is not shared by the capitalist?—I would rather not go into these technical details.

11,068. Are you aware that a great many of these men are paid only £200 or £300 a year by the capitalists?—I am not aware of that.

11,069. To come back again to the incentive of private gain, what incentive is there of private gain to a poor chap who is managing a mine and only getting £200 or £300 a year for a job that is worth £500 or even £1,000, and who cannot get any more?—Curiously enough, if a man is working for a private concern, he gets a personal interest in it. I have

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

known myself agricultural labourers earning 15s. a week who would speak of "our fruit," "our crops;" though they had no other interest in the farm than the 15s. a week they were earning, they had a personal interest in it, because they were working for a comparatively small concern.

11,070. Are you aware that these mining managers are banding themselves together to fight for more money?—Of course, with regard to them the position is that their cost of living has gone up as everybody else's has.

11,071. In 1914 was £200 a year a proper remuneration for the manager of even a small mine?—I cannot give an opinion on that.

11,072. Does that not seem to show that there is a little reservation to be made on your evidence?—I do not think that point is important.

Mr. R. W. Cooper: May we take it that we are going to have information about this later on?

Sir L. Chiozza Money: Yes.

Mr. R. W. Cooper: You were making a general statement that mine managers are only getting £200 a year?

Sir L. Chiozza Money: I say that that applies to some.

Witness: You implied to me that that was the general pay.

11,073. I am sorry if I gave that impression?—It is not the case, then, that it is the general rate of pay?

11,074. I said a considerable number of mine managers are getting £200 a year. Evidence will be given about that?—It is not my job

11,075. Yes, it is, because in your paper you seem to indicate your opinion that the present position is one which is calculated to bring out of the men all that is best in them?—I keep saying, again and again, human beings are fallible and weak, but I contend that the private enterprise brings out better results than public enterprise.

11,076. The result is that after certainly 150 years' working of the coal industry, you have mine managers only earning £200 a year?—One has to know all the circumstances.

11,077. You have referred to coal-getting machinery. Are you aware that the last Coal Commission particularly referred to the fact that very little coal-cutting machinery was used in this country?—I understand that the mines in England are not well adapted to coal-cutting machinery.

11,078. Do you know that even during the war, when it was very difficult to get machinery, there has been a larger development in coal-cutting machinery than in the last twenty years?—It may be so, but again I cannot check your statement.

11,079. I do not like to give figures without perfect accuracy; but are you aware that it is the fact that there has been a much larger development in coal-cutting machinery during the years of the war?—I am not aware of that, but I should think it is highly probable, because there was a deficiency of labour.

11,080. Are you not aware that the whole application of machinery to coal mines has been retarded by the people who work the mines not being properly remunerated?—Again I cannot check your statement.

11,081. Do you not know that as machines have been applied to industry the rates of pay have been so lowered that workmen have it in their minds that machinery is not good for them, whereas in America, on the system of paying the men out of the product of what he makes, quite a different result is arrived at?—There you raise a large question which applies not only to coal in this country, and that is that both employers and employed have, by following a wrong policy on each side, led to a bad result.

11,082. Are you not struck with the fact that throughout the world in the last 20 years there has been a continual growth of nationalisation and municipalisation of various industries? Does that make any impression on your mind?—Yes, I think that is a fact.

11,083. Does it not lead to the conclusion that the experience of men in many divers countries under divers conditions, and applied to many industries,

leads to the greater and greater inclusion in what I may call public ownership of an increasing number of industries?—I think the general explanation is this, that when people have suffered certain inconveniences under private ownership they look to public ownership as a solution of their difficulties, not seeing the difficulties that they will encounter under public ownership. There is a craze for public ownership at the present time (in which I include the last 25 years) which we shall bitterly pay for in the future.

11,084. I said in the last 20 years?—Yes, I call the last 20 years the present time.

11,085. Surely that is a very long time for a mere craze to last?—Not at all. Human beings have lasted much longer than that.

11,086. Can you tell me whereabouts in the world there has been any reversion to the process of private ownership? Has it not been the case that it has been impossible to find any instance where an industry has been taken into public ownership that it has reverted to private ownership?—That is one of the dangers.

11,087. Surely the many nationalities and races cannot be so foolish, after having witnessed the spread of this conception, as not to desire to revert from it if it is wrong?—It is often in life very difficult to reverse a blunder.

11,088. Have I not reminded you that in those cases of Australia, New Zealand and Ceylon there was no need to reverse the process?—That is a matter of argument.

11,089. Will you not admit the argument?—I will admit that there have been some good cases of State enterprise, but I still maintain the proposition that in the main private enterprise is better, that the present craze for State enterprise has not yet had its full fruition, and when it has we shall be sorry that we passed through that phase.

11,090. Would you sell out the schools of this country to private schoolmasters?—Off-hand I do not like to give an opinion on that.

11,091. I am asking, would you sell out the schools or not?—The question of selling out is a very difficult question.

11,092. Everybody knows what I mean. Would you change the State schools into private schools?—I think State education is a most mischievous thing.

11,093. I am so glad to have had that from you?—It is over the difficulty of "selling out" that I hesitate.

11,094. I will try and choose my words more carefully. Would you change the sewerage system from a public system into a private system because in your opinion private enterprise is more thorough? The sewerage is a most important industry, because if it goes wrong all our lives are in danger?—No, I will give you the sewers.

11,095. Then it comes to this: we are to be allowed to keep our sewers, but we are not to keep our schools?—Yes. I think the State has sufficient capacity to deal with the sewers, but not to educate the people.

11,096. Are you aware that the sewers are carried on as a private enterprise? Do you know that there is a company working the sewers in Argentina for a profit?—That is a very interesting statement, but I do not know it.

11,097. If efficient sewers are so important on which our health depends, why should you present me with the sewers and risk your own life?—Because I thought you seemed so anxious about them.

11,098. Then, to go to another matter, would you sell out the London County Council tramways to private enterprise?—I think the London County Council made a mistake in taking them over.

11,099. Would you agree to the formation of a company to take them over because, in your opinion, private enterprise is the best for them?—Yes, I would, and I would also do the same thing with telephones and telegraphs.

Sir L. Chiozza Money: So that it comes to this, that the State is to be permitted to own the sewers only!

Sir Arthur Duckham: Before I ask the witness anything I want to mention a certain point. The

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

expression has been used—on one side and on the other. I would like to say that I am not on one side or the other, and would not like it to be said that I am in favour or not of nationalisation. We are here to do the best we can for the country.

Mr. Arthur Balfour: I agree with that.

11,100. *Sir Arthur Duckham:* Sir Leo has asked you one or two questions about the Ministry of Munitions and the value of Civil Servants. I presume you will agree with me that Civil Servants are an excellent body of people?—Yes.

11,101. And that they do excellent service for the State?—Yes, quite so.

11,102. I suppose you are aware that a large number of people have come in and helped the State?—Quite so.

11,103. You could not call Lord Moulton a Civil servant?—No, not by training.

11,104. I do not know whether you are aware that the great success that Sir Leo mentions with regard to explosives was in a great part due to a Mr. Quinan?—He was not a Civil servant.

11,105. He was the head of De Beers Explosive Works in South Africa, and came over here and worked for the State. I do not know whether you are aware that in the Council of the Ministry of Munitions of those who did this work there was only one Civil servant, namely the Secretary?—No, I was not aware of that.

11,106. Perhaps you might be aware that only one member of that Council received any remuneration?—No, I was not aware of that.

11,107. I only bring that out to lead up to this question, to ask you whether such a thing could occur in normal life?—I am obliged to you for asking me that. One of my contentions is that in war time you get different human motives operating to those you get in peace times, therefore, you can do things in war time that you could not do in peace time.

11,108. Do you suggest that the present method of ownership and working uncontrolled is satisfactory?—I do not think anything in life is entirely satisfactory.

11,109. Your document is very interesting, but if I may say so it is somewhat destructive. Can you put before us anything constructive on the present situation? Have you any suggestions to make?—When you say it is destructive I take it you mean that it is conservative?

11,110. It is destructive of suggestions put forward by other people?—It was intended to be.

11,111. Have you any suggestions to put forward to benefit the State? Have you read the evidence that has been given at this Commission?—Yes.

11,112. Have you seen the difficulties that occur at the present time, that some mines do pay whereas others do not, and have you any suggestions to put before the Committee to assist us?—I am afraid that most of my suggestions would be negative. I want to keep the House of Commons out of it.

11,113. Is the House of Commons, for instance, in the Post Office?—To a very large extent.

11,114. Does it affect the Post Office working?—It does, especially as regards Ireland. A large amount of money is lost in Ireland because the Irish members are always badgering the Postmaster General.

11,115. Ireland is a special case?—It is a case where Parliamentary interference results in loss of money.

11,116. Let us take other State enterprises, does the House of Commons really affect them very much?—Yes, there is a very great danger of people being put into important jobs for political causes.

11,117. At the present time does not Parliament affect the whole of labour equally, whether it is State employed or industrially employed? Take the case of wages, would you not say that that is just as much affected industrially by Parliament?—The danger with regard to Parliament as regards wages is that political interference at a particular moment might be in favour of a particular group of well organised workmen against the public interest. A member of Parliament must always think of votes first. He cannot live otherwise.

11,118. At the present time does he affect State enterprise any more than ordinary industry?—No, but I am objecting to the State extending its functions.

11,119. Say that you have one of those national factories and an increase in wages is required. An agitation is got up to obtain that increase in wages; does the agitation affect a State-owned factory any more than a private owned factory?—Yes, from this point of view, that there is no counterbalancing power on the other side. In the case of a private owned factory you have the opposition of the employer which acts as a buffer between the workpeople and the community. In the case of a State owned factory you have no such buffer, therefore, you might get them a wage at the expense of the community to which they are not entitled, but which they extort from Parliament through political pressure.

11,120. Where does the buffer work? In Parliament?—No, because you get the opposition from the employers but there is no parliamentary opposition to a demand for increased wages.

11,121. You say it is some safeguard?—It is some safeguard.

11,122. Have you any suggestions which would assist us at the present time? Do you consider that mine owners ought to band together in districts or any amalgamation of interests?—I think that is really a matter for the people engaged in that industry to consider for themselves.

11,123. You have not formed any idea for bettering the condition of affairs?—I could not suggest any specific scheme without having a detailed knowledge of the trade.

11,124. With regard to the distribution of coal during the war you gave an example of the Leeds Corporation Gas Works which were compelled to get their coals from Durlam?—I could give you further particulars about that.

11,125. Do you know of any other places that have suffered in this way?—I happen to have here the full details about Leeds.

11,126. I will not ask you about that, because I accept your point there?—I have here a similar case from Sheffield. May I read this statement to you? This is a statement that has been passed on to me.

11,127. *Mr. Herbert Smith:* Will you tell us who is the writer of it?—The author of this statement is Colonel Hewitt. I do not know who he is.

Sir Arthur Duckham: Do you wish that statement to be read, Mr. Chairman? I understand it is simply a statement.

Mr. Robert Smillie: It is written by a colliery owner.

11,128. *Sir Arthur Duckham:* Perhaps I might put the question in this way: Are you aware that at Hull, which is in the Yorkshire coalfields, they had to import their coal from Durham?—I did not know that.

11,129. Are you aware that at Shrewsbury, which is quite close to coalfields, they have had to import coal from Durham?—From all the information I have got, I should think it is extremely probable.

11,130. Perhaps you may be aware that industrial undertakings in London were given Welsh steam coal in the place of gas coal?—I have been told that they were given a much larger amount of stone than before the war.

11,131. You are aware that there has been a very great deal of dissatisfaction in the distribution of coal in the country?—Yes, I am aware of that, under the Coal Control.

11,132. *Mr. J. T. Forgie:* I suppose your position is this, that while the present system of private ownership may be good or bad, you do not want to change from it?—Not to State ownership.

11,133. That is from the knowledge that you have?—I do not want to change to State ownership.

11,134. You are quite prepared to see an improvement in the present ownership, I take it?—Certainly; one wants improvement in every direction.

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

11,135. I understand that your experience of public service is not such as to make you desire to see the private ownership done away with?—No, we should get worse results.

11,136. Is it the case that the relation between the State servants and the workmen is any better than with private owners?—This is true, that a man working for a private owner will be less exorbitant in his demands than one working for a public owner. During the war workmen have come to private owners and said, "You might give us a bit more because the State will pay it"; they have used that as an argument, and that seems to me to show that the State would be plundered without the employer coming in.

11,137. That is to say, through some pressure or other, the State might be led into paying more wages to the men?—Yes, more than was fair to the rest of the community.

11,138. And really paying more than what the economic wage should be?—Yes.

11,139. Therefore, that would be against the interests of the nation?—Yes, quite so.

11,140. Do you think that it is likely that a worker employed by the State would give more product to the State?—I feel absolutely certain that the contrary would be the case, and I should mention especially the telephones. Many years ago I had to see some men employed by The National Telephone Company. Incidentally, they went on to talk about the coming change in the State service. There were three of them, and they all told me, "Of course, we shall not do anything like the work we are doing now, because for the work we do now in a day the Government servants take three days to do."

11,141. Are you aware that the coal trade under the Coal Control is at present practically under the State?—Yes.

11,142. And that the employers are not given profits, but simply a rent for their collieries and so much payment for their services, and that, no matter what the profits may be in the trade, the coalowners are only guaranteed a certain amount of money?—They get the 5 per cent.

11,143. That is to say, out of all that 25 millions of extra profits which has been so much talked of in this room, the coal owners could not possibly get more than 1¼ millions?—Yes, I have pointed that out in the Press many times.

11,144. And that the State really gets the £23,750,000?—Yes, that is right.

11,145. So that at the present moment the miners of this country are really working for the State?—Yes, certainly.

11,146. Are you aware that they have done anything more for the State?—So far as I can gather from the action of the miners, they have been doing the best they could for themselves.

11,147. Are you aware that recently, within the last two months, in Lanarkshire they have reduced their number of days' work from 11 to 10 per fortnight?—Yes, I saw that stated.

11,148. That of course means a material reduction in the output?—Yes.

11,149. In all probability the resulting shortage of coal would take place in the export of coal?—Yes.

11,150. And that export of coal is a very important matter for the country?—I think it is one of the most important of our national industries.

11,151. Do you think there is any argument in favour of it being better under State ownership?—I think the action of the miners proves that the men will work worse for the State than for private owners.

11,152. Do you think that State ownership would prevent disputes that would develop into strikes?—I think the evidence of the past year is directly to the contrary.

11,153. We have had lately an experience in London of a State service striking: I am referring to the London police?—Yes.

11,154. *Mr. Evan Williams*: Following up that point, you are aware that it has been put forward as one of the strong arguments for nationalisation that it would tend to allay industrial unrest?—Yes.

11,155. May I ask what is your view on that point?—My view is that it would not have the slightest effect in that direction.

11,156. The unrest among miners, I suppose you are aware, is very largely due to this unofficial body at any rate as far as South Wales is concerned?—I understand that the unofficial body is opposing the Federation.

11,157. And that they are against nationalisation?—They are against nationalisation in Sir Leo's sense: they denounce nationalisation as a scheme of the capitalists.

11,158. Some questions were put to you with regard to the attitude of the employers on the question of safety. I believe you were not in Parliament in 1911?—No, I was in Parliament from 1906 to 1909.

11,159. Have you heard it suggested outside this room that employers for financial reasons have opposed measures of safety?—That suggestion was made, but I think the history of industry proves that employers, whatever the industry may be, tend to oppose a law which might impose heavy charges on them; I think it is almost inevitable that they should do so.

11,160. Notwithstanding that they are put forward on the plea of increasing safety?—It is all a question of balance. We are none of us absolutely altruistic, not even the best employer.

11,161. Are you acquainted with the fact that where Government interferes, as it is proper that it should, in questions of safety, it is apt to define one method of obtaining safety to the exclusion of others?—Yes, I am quite aware of that, and that is, of course, the general mischief of Government actions.

11,162. That under State control would be intensified?—Yes.

11,163. The initiative of the manager would be largely interfered with?—Yes, that is the inevitable consequence of Government action. It all tends to be uniform, and you can see that is the position of the State socialists by their demanding State control.

11,164. Have you made any observations on the comparison of State control and a similar enterprise under private control?—It seems to me that if the State does its duty, that action can be as well done in controlling the action of private employers. I think you would get two Government Departments fighting one another, which is one of their greatest pleasures in life.

11,165. I think you agreed that the war did give a much better chance for State control to be successful than it had in normal times of peace?—It operated in both ways: it made State control necessary where before it was not necessary, and it made the public more willing to accept the control for patriotic reasons.

11,166. Do you consider that the experience of the State control of mines during the war has been an altogether good one?—I should say that the experience of State control everywhere has been fairly bad.

11,167. If it has been bad in wartime, is it likely to be any better in peace time?—No, I think it is likely to be worse and more bitterly resented.

11,168. *Mr. R. W. Cooper*: Do you think that the wishes of the consumers of coal are likely to receive the same consideration under State control as they have done under private enterprise?—No, because under private enterprise the private owner cannot live unless he satisfies the consumer, and the State can say, take it or leave it.

11,169. Now one question on the subject of distribution: there seems to be a sort of impression that these wholesale co-operative societies can always so distribute the coal as to leave a profit for their shareholders. Have you looked at all into the question of co-operative society dealing?—I have some figures here which are rather striking. I think your question is that it was suggested that co-operative societies were very successful in distributing coal.

11,170. So much so that they reduced the price to their members?—I have here the balance sheet of the Edmonton Co-operative Society, which shows that they made a profit of 2s. 8½d. in the £ on drapery, 2s. 10d. in the £ on boots, 3s. 6½d. in the £ on tailoring, and a loss of 7d. in the £ on coal, but they distributed their dividends to the purchasers of coal as to other purchasers, so that the persons who bought coal from them, though the Society lost money on it, would be receiving part of the profit due to the people

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

who bought drapery, etc. Then again I have figures here from the Manchester & Salford Equitable Society, which shows similar results, except that in this case coal made a profit of 1s. 1d. in the £ as compared with 1s. 11d. for butchery, 3s. 11d. for drapery and so on. In the case of the Stratford Co-operative Society, drapery made 2s. 11d., boots 2s. 11d., clothing 3s. 2d., butchery 1s. 7d., and coal 4½d., so that in all those cases coal comes out very badly.

11,171. *Sir L. Chiozza Money*: Are those official figures, may I ask?—Yes, these are taken from their published figures.

11,172. *Mr. R. W. Cooper*: So that it is by no means universally true that the dealing of these societies in coal is a profitable transaction?—No, it is less profitable than their other transactions.

11,173. In your statement you speak about a truck providing the cheapest storage for coal. I suppose you know sufficient to know that a truck is very often a necessary form of storage?—Yes, I personally do not see how you can dispense with storage in trucks.

11,174. It depends on the exigencies of the person to whom the coals are delivered?—Quite so: As, for instance, if a ship does not come in on the day it is expected, the coal must be stored till it arrives.

11,175. And if it comes in on a Saturday, it has to be stored till the Monday?—I gather in the steel industry they work continuously, but in the coal industry they work normally 5 days a week, so that you must store coal on the Saturday for the Saturday till Monday consumption, and I daresay if *Sir Eric Geddes* saw these trucks standing outside, he would say that it was very wasteful.

11,176. I understand that the Midland Railway Company are laying out an additional storage ground for trucks?—I think they have done so already. They have laid out a large acreage of ground for storing coal in trucks.

11,177. So that it is rather a fallacy to suppose that a truck can be kept in motion?—Quite so.

11,178. *Mr. Arthur Balfour*: Do you know of any precedent for national ownership of sufficient magnitude to help us to decide that it is safe for the coal industry?—Frankly, I do not. It is safer for the State to take over a non-speculative industry than it is to take over a speculative industry.

11,179. You do agree that the coal industry is a risky industry?—It is an extremely speculative industry.

11,180. And the return on it of 9 per cent. is lower than the return on general industry?—That is a statement made by the Income Tax authorities which I see no reason to dispute.

11,181. Therefore, it is not unduly remunerative?—No, many people lose money. The Powell Duffryn Company were attacked for making large profits, but they pointed out that a large part of their profits were due to the by-product industry which they have established adjoining their mines. Another large colliery in South Wales for many years was making no profits at all.

11,182. It has been suggested to us that we might turn our attention to the fact that the State has been able to run an Army of 6 millions as a precedent which we could examine. What are your views upon that?—It is impossible to compare military operations with industrial operations, and the fact that our State has been successful in its military operations proves nothing as regards efficiency because it has been fighting another State. I do not think the thing has any relevance at all to the problem of industry, because first of all you have the motive of patriotism to inspire your people to do their duty even at the cost of life, and it is notorious that a man will give his life for his country when he will not give his profits or his wages; but beyond that the people have to face this question: Are they prepared in the last resort to put military law into operation and shoot a man who refuses to do his duty?

11,183. Can you conceive that the people of this country would ever submit to military rule in their daily life?—I think they would be much more likely to do the shooting themselves.

11,184. Then you do not think that the people of this country would submit to the Prussian system of State railways?—Certainly not.

11,185. I think in the cross-examination by *Mr. Sidney Webb* he raised the point that you had very strong convictions on individualism, and he on the other hand had strong convictions on nationalisation. On the question of individual enterprise, I believe you have some substantial facts that can be established?—Yes, I think they are patent to all the world.

11,186. But in answer to my question, you replied that there was not a precedent which we could examine of sufficient magnitude for nationalisation, therefore the other side have not the same opportunity of examining their convictions?—I do not know myself any case of State enterprise which is sufficiently conclusive to justify further experiments in the same direction.

11,187. It is therefore a question of experience against theory?—Yes, but I think in life you always have to think of theory too, and I think the theory behind private enterprise is sounder than the theory behind State enterprise.

11,188. That being the case you would think it a very risky experiment to trust the coal mines to the State at one step for them to experiment on?—I think it would be a most disastrous thing to do.

11,189. The question of housing is also raised in your paper: are you aware that private colliery owners at the present time are building very excellent houses for the collieries?—I think it is quite likely that some may be doing so.

Mr. Thorneycroft: Sir, may I ask, at this stage, on behalf of the coalowners, that you should rule out any reference to housing? I think *Mr. Smillie* will support what I am going to say.

Mr. Frank Hodges: Sir, I rise to a point of order. At any stage of this Enquiry can any member of the public interpose without your calling upon him to do so?

Chairman: I do not think he is entitled to, but I think what we are entitled to do is, we could hear what *Mr. Thorneycroft* says, and I am sure the Commission would have the courtesy to hear him.

Mr. Frank Hodges: I should object to that course being adopted.

Chairman: Then I will call upon *Mr. Thorneycroft* next.

Mr. Arthur Balfour: In *Mr. Sidney Webb's* question to you yesterday, at No. 10,845—

Sir L. Chiozza Money: Sir, I am very sorry to interrupt *Mr. Balfour*—

Chairman: Sir Leo, I rule that you are out of order.

11,190. *Mr. Arthur Balfour*: *Mr. Sidney Webb* asked you whether it had been brought to your notice that there were, from an economical point of view, some bad effects from the gas sliding scales: "The gas directors are said to lose a great deal of their interest in economies—it is rather like excess profit tax—they get so little out of any improvement that they are not keen on making improvements." Would you agree, if that is the case, that they would have very much less incentive to making improvements if the whole thing were owned by the State?—I think that is quite clear, but I do not quite see why gas proprietors have not a full incentive to make all the improvements they can.

11,191. The control which is exercised over them by the Act of Parliament in regulating their prices is surely very slight as compared with State ownership and management?—There is no evidence that private gas companies are less enterprising in the direction of making improvements than municipal gasworks are.

11,192. Can you suggest to us any means by which we could meet the legitimate desire on the part of the miners to assist in some way in conducting the coal trade?—I do not think it is a legitimate desire. I think the miner's desire to have some voice in managing his own conditions of work is quite legitimate. I am a wage-earner myself: I am content to get my wages and do my work; I do not want to conduct the industry that employs me.

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

11,193. Can you suggest any way in which we can meet their desire to go more keenly into the conditions under which they work?—I think there ought to be some kind of committee of employees in each district.

11,194. Each district or each colliery?—I should think both, myself.

11,195. I think you will agree that it is not reasonable or fair to examine war conditions on a question of this kind as compared with normal conditions?—No.

11,196. Because, as has been brought out, there are other incentives under war conditions?—Quite so.

11,197. I should like you to take the question of steel: Is it reasonable to expect any company to have a sufficient supply of steel under its command for a war that has to be carried on regardless of cost?—I might answer that by saying, Were the State prepared with a sufficient number of soldiers.

11,198. If the State knew there was to be war—and no one could know it better than the State—they ought to have provided some store of steel against emergency—If it was wanted for war purposes, it was the business of the State to look ahead.

11,199. I take it the same argument applies to explosives?—Certainly.

11,200. If the State had any anticipation that there was to be a war, it was their business to have a sufficient amount of explosives as an insurance?—Quite so. Generally the State looks ahead less than the private employer.

11,201. Whereas it is the business of the State to protect our realm and be informed more rapidly as to when war is likely?—Yes. I think the Admiralty did look ahead to some extent.

11,202. The Admiralty, as you would be aware, acts very much on its own?—Yes. The country has had the intelligence to leave the Admiralty alone because it knows its importance.

11,203. The Admiralty refuses to be interfered with by other Departments of the State, and ignores political interference?—That is true. I put down the success of the Admiralty to the fact that it is not interfered with.

11,204. Reference has been made to the excellent work done by Lord Moulton, which was done absolutely regardless of cost. It would be impossible for a private employer to spend the money then spent and not to have gone bankrupt?—Just so.

11,205. Therefore, that cannot be taken as any precedent?—No.

11,206. Take for one moment the telephone question. Do you know that when the State took over the telephones they immediately very largely increased the cost of subscription to the subscribers?—I do not remember that.

11,207. Are you aware that they went from a flat rate to a rate based on the calls made?—Yes, I remember that.

11,208. In many cases that increased the subscription being paid by people from £7 10s. to £150?—I did not know it was so big as that.

11,209. If that is the case you can conceive that might have something to do with the small profit referred to?—Yes, I think the telephone system is immensely worse since the State took it over; it is scandalously bad compared with the United States of America.

11,210. And compared with Switzerland?—And Sweden, where the manufacture of telephone instruments has been highly developed, largely because the State in this country opposed the telephone to keep up its telegraph monopoly. The "Times" of yesterday says that one of the greatest causes of Mr. Wilson's unpopularity in America is on account of the democratic management of his administration and also its blunders, especially in regard to the Government operation of railways, telegraphs, and telephones.

11,211. Can you suggest to us any means by which it is possible for the State to own an industry; that is to say, to find the capital for an industry and then to divorce that industry for political purposes?—I do not think it is possible. It has been tried in Australia, where they set up an independent Railway Commission. Soon or later, Parliament asserts its

authority. If you think of it, it is necessarily so. If the final voice rests with Parliament, that voice will be finally heard.

Chairman: Mr. Thornycroft, the position is this. If you want to make an application, I do not think you are in order. If you want to give evidence with regard to something, if you will kindly let me have a *précis* of that evidence, I will call you first thing on Wednesday morning.

Mr. Thornycroft: I want to call attention to the recalling of one of the witnesses. One of the miners' witnesses has quite inadvertently, but very seriously, made a misstatement of fact.

Chairman: Give me the name of the witness.

Mr. Thornycroft: Mr. Robertson.

Chairman: We will have him recalled, Mr. Thornycroft. I do not want you to tell us anything about the nature of the misstatement. You might, in stating the nature of it, be giving evidence. Will you kindly tell us the nature of the misstatement in your *précis*, and I will communicate with Mr. Robertson. I will put it to him and have him recalled, if necessary.

11,212. *Mr. Robert Smillic:* I think you have rather a strong feeling against the miners?—No, not as human beings at all. I think they are just nice human people, but they are looking out for themselves rather too strongly, perhaps.

11,213. You have a feeling against the Fabian Society?—No, I used to be a member of it years ago. I have no bitter feelings with regard to it.

11,214. I was going to call your attention to that. Is it you grew more sensible and you left?—We all try to grow more sensible as we grow older.

11,215. Are you an opponent of trade unionism?—No, not at all.

11,216. Do men combine into a trade union that they may be able to secure better terms?—Quite so.

11,217. When they combine, do not they set out, and it is well known to themselves and the public, to place themselves in a position to come out on strike?—Yes; that is, of course, the final argument.

11,218. It is quite legal for men to come out on strike?—Of course, it is still a free country—partially.

11,219. Only partly?—Yes.

11,220. You are quite right. You made a statement this morning that the miners have acted during this war very selfishly?—Yes, I think so.

11,221. And have secured everything they could secure for themselves?—Yes, I think so.

11,222. Supposing members of the Government and some of the largest colliery owners in this country say that the miners have acted splendidly industrially during the war, would you accept that?—I can only say the opinion I gave was the opinion I have formed on all the facts before me.

11,223. Are you aware that the miners deliberately agreed to the fixing of the price of coal in order to keep it down?—I do not say they may not have done some good things. I say their general policy has been for themselves, without regard to the interests of the State.

11,224. Do you know that the miners at any time during the last four years had the power to have their wages raised higher than they have been?—They have had their wages raised a great deal during the war.

11,225. Are you aware they had the power to have their wages raised a great deal higher than they have been, and did not use that power?—You mean they have not used their maximum power?

11,226. They have not used that power?—I should think that is possible.

11,227. Are you aware that, up to the present time, their wages have not increased more than the cost of living has increased?—No, I do not think that is true; I think wages have increased more than the cost of living.

11,228. You are told that Lanarkshire miners acted very unpatriotically in going from 11 days a fortnight back to 10 days?—Yes.

11,229. Are you aware they have only reverted to a rule which was recognised by both sides for 25 years, working 5 days a week? Are you aware they gave

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

up the 5 days a week and went to 11 days a fortnight, as they had been doing for 25 years, during the war?—Yes, the question is whether they have not gone back to the 10 days system too soon.

11,230. They are only reverting to what was their previously agreed upon course?—Yes.

11,231. I suppose they believe now the need for the production of coal has gone?—Yes, I think they have made a mistake in their judgment.

11,232. Are you aware that in Lanarkshire where the workers have gone back to 5 days a week; that they have by far the best average attendance during the war—during the last four years?—I am not aware of that.

11,233. Are you aware that absenteeism in that county was 7 per cent. less than the average of the country?—No, I am not aware of that.

11,234. Are you not rather condemning miners wholesale without having full knowledge of the facts?—No, I think the public facts are sufficient to justify the statement that the miners in the mass have acted selfishly during the war.

11,235. If it appeared in the "Times," would that justify it?—One has to take one's information from where one can get it; I do not say all newspapers are perfect.

11,236. Can you give me the name of the employer where the workmen went and told him "You can give us more because the Government will pay it"?—Statements have been made by many people in private conversation.

11,237. Give me the name of one person?—I cannot give it to you at the moment.

11,238. It is a damaging statement. It is a statement against the honour of the workmen of this country. You say here is hearsay evidence of the gravest kind where the workmen went to the employer and said the State will pay so you might as well give us a bit more?—I will see if I can trace my memory back to it and find out who it was and let you know.

11,239. I think you made the statement that the housing conditions of the miners has nothing to do with nationalisation, and that it should not be brought in?—That is so.

11,240. Do you say if the housing conditions of the miners are especially bad that it ought not to have anything to do with nationalisation?—If the house of a miner is especially bad special measures ought to be taken to deal with it. That has nothing to do with nationalisation, in favour or against it.

11,241. Do you think the State ought to build houses adjacent to the collieries?—The miners ought to see to that through their Federation.

11,242. To build their own houses?—Or employ people to build them.

11,243. Employ people to build them?—Why not?

11,244. Because a miner cannot save during the course of a lifetime enough money to enable him to build a house?—Surely in many industrial towns, like Leicester, people have houses built for them which they proceed to buy. Why should not miners do the same?

11,245. The working people of Leicester may be able to save sufficient to build a house, but coal pits are put down wherever the coal is and a workman might build a house close beside the coal pit, the coal pit might run out and he would have to leave?—You mean to say a coal pit is a special case for a tied house as we call it in the south of England.

11,246. The employers' houses are tied houses?—I admit there is a case for tied houses on farms and in the neighbourhood of coal pits. But it is a system to be avoided as far as possible; it interferes with the freedom of the workman.

11,247. You said the Government never house their employees?—Except their Prime Minister and such like people.

11,248. Would you be surprised to know they are housing by far the vast majority of their employees?—I should certainly be surprised.

11,249. Do not they house their Army and Navy?—I thought we agreed the Army was quite a different proposition to industry.

11,250. They are government employees and the Government house them?—I will not accept the proposition that the Army and Navy come into the industrial sphere at all. We are dealing with an industrial problem. I say where Government controls industries it does not house its employees.

11,251. You say that mining has been a very well paid industry?—Yes, as compared with the rest of the community.

11,252. Let us see. Are you aware of the fact that for a period of 40 years the average income of the adult mine worker was 30s. a week?—During the same period the adult average wage of the agricultural labourer was 15s. a week or less.

11,253. I am not dealing with agricultural labourers.—I am comparing miners with agricultural labourers.

11,254. I am dealing with miners and the dangers you admit he has to face. You say he is fairly well paid?—Compared with the average of the community for similar work outside.

11,255. I want to take his usefulness to the community and the same usefulness of agricultural labourers. You would not defend the landlord or farmer paying 15s. a week?—No, I think agricultural wages have been very much too low in the past.

11,256. I put it miners' wages have been much too low and I am correct in saying the average was under 30s.?—That does not conflict with my statement that relatively to other people in the community they have not been underpaid.

11,257. Do you agree with their wages being under 30s. a week?—I say that relatively to the other people in the community miners have not been underpaid.

11,258. That is not really the inference to be taken from the statement?—That is my statement itself. You can make what inference you choose.

11,259. You are sufficiently clever to avoid an answer.—If you will tell me what your straight question is I will give you a straight answer. I have not had a straight question.

11,260. I will give you a straight question now. Do you know how many mine inspectors there are in this country?—No.

11,261. You say the Government have inspectors of mines?—Yes.

11,262. Are you aware the Inspector of Mines whose duty it is to inspect the British Coal Mines could not make one inspection per year per mine?—That may be a strong argument for increasing the number of inspectors, but it has nothing to do with the question of the nationalisation of the mines.

11,263. It has surely something to do with the nationalisation of mines?—No, the Government would lose so much money in nationalising the mines that they could not afford to pay mining inspectors.

11,264. We know the Government are paying so much that they could pay mining inspectors. We differ on that?—Yes.

11,265. You indicate private ownership of mines has amongst other things devised and applied life saving apparatus?—Yes.

11,266. What life saving apparatus?—I mean gas masks and things of that sort arose out of the mining industry.

11,267. Do you know of any safety appliances that has been applied to mines by legislation during the past 40 years which has not been opposed by employers?—I cannot answer you on that question. I have not the facts.

11,268. You put it here as if it were private ownership of industry which has done all this?—I think there is undoubted evidence that a great many mine owners, I will not say all, have spontaneously devoted a great deal of thought and money to develop life saving appliances and improving the conditions of life.

11,269. Do you know of a specific case?—I cannot give specific cases from my memory at the moment.

11,270. If the mines had been well managed from the point of view of safety as they ought to have been, there would have been no necessity for State legislation?—It is rather difficult to say that about an industry. I think the function of the State is to look on and correct people where they go wrong. I think that is required more or less in all industry.

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

11,271. Are you aware that the mine owners of the country opposed very strongly the idea of inspectors of mines being allowed to inspect the mines?—It is quite likely.

11,272. You are not aware of your knowledge it was so?—I am willing to accept your statement. I think it is very probable.

11,273. If you think it is correct as it is would you justify that opposition?—It depends. Take the case of factories which I know more fully. I know some employers in factories just as I dare say you know some employers of mines have opposed inspectors because they did not want to be worried with them or for various reasons. I know employers in factories who have welcomed inspectors. An employer has said to me: "I like the inspectors to come round and see these works." He was dealing with a proper protection for a steam saw. He said, "the inspector has his mind on that job; I have my mind on a thousand other jobs and I like to get expert opinion."

11,274. Inspection by legislation is to keep the worst up to the position of the best?—I think that is so. That is the sort of thing the State can do.

11,275. Do you object to the present State control of the mines?—I object to the State interfering with the commercial or industrial side.

11,276. Do you object to the State limiting the price of coal?—Yes, I do. I am arguing about peace times now. The whole argument as regards war time is a very complicated argument.

11,277. Is it not likely you would have had to pay £1 a ton more for your coal if it had not been for the Government?—It is very hard to say; it is a speculative question. I am not sure we should not have done better with less State control of prices during the war; it is very hard to say.

11,278. If you were in the know you would know better. Are you aware that a coal organisation Committee composed of three mine owners and three miners agreed to ask—of course the price of coal depends on the price they get?—And the wages too.

11,279. The wages of the miners depend upon the price?—Yes.

11,280. Those six people agreed to ask the Government to fix the price because the scarcity of coal would throw the price up by £1 or 30s. a ton?—It is quite likely. I keep an open mind with regard to war conditions. It was possibly necessary to have some fixation of prices during the war. I oppose the fixation of prices by the Government after the war.

11,281. Do you say that was a selfish act on the part of the Miners' Federation?—The action as stated by you was rather fine.

11,282. Rather unselfish?—Yes, on both sides.

11,283. Are you aware the miners have been publicly thanked more than once by public officials?—I would not attach much importance to that.

11,284. Not on the question of going to the front but their action on industry. You fear the influence probably of labour in Parliament in the event of mines being nationalised?—Yes.

11,285. Do you think there has been an extraordinary amount of influence used by the employers and the land owning class from time to time in Parliament?—You mean in the past?

11,286. Yes?—Certainly.

11,287. And at the present moment?—Lansdowners have not much pull now.

11,288. They have not?—No.

11,289. The House of Lords has not much pull now?—Very little.

11,290. Have you made any study relative to the loss of coal in this country through private ownership of minerals and mines?—Yes, I am quite certain it would be enormously greater if you had State control.

11,291. Supposing you were told by 80 per cent. of the mining experts of this country it would have the other effect and that this loss would not have taken place, that is to say, the barriers left in between two landlords' properties would not have been left in but for private ownership, what then?—I know that question. It has been very much exaggerated. That question of barriers between different landowners property I do not think there is much in.

11,292. Do you think mining engineers and mining experts are not the best judges?—They might point to a particular case where there is a particularly heavy loss. Taking the country as a whole I do not think it amounts to very much.

11,293. As a matter of fact they can give you figures; they are at the Home Office. It is millions of tons?—You mean to say unnecessarily wide barriers are kept up?

11,294. It was not necessary in many cases to have barriers at all. There have been barriers of 80 yards?—There are all sorts of complications with regard to water and all kinds of things which justify the barriers in many cases where at first sight they do not appear to be justified.

11,295. I do not speak of barriers kept there to keep water back although sometimes barriers that have been left to keep water back would not have been wanted to keep back the water at all if the water had been pumped out by a proper system of drainage?—I do not deny there might be mistakes under private enterprise. I say there would be more under State enterprise. That is all.

11,296. *Mr. Frank Hodges*: You are a journalist by profession?—Yes.

11,297. Have you ever been down a coal mine?—No.

11,298. Have you ever been on the top of a coal mine?—No.

11,299. You speak with a remarkable amount of knowledge about collieries which you have never been down or on the top of. Where do you get your information from?—I collect it from various sources, as journalists have to do in the pursuit of their trade.

11,300. Where in particular?—From newspapers, or anything I can get from experts.

11,301. Have you ever gone to any authorised source for information?—What do you mean by "authorised source"?

11,302. The Coal Owners' Association for information?—Yes, I have applied to the Coal Owners' Association or anybody who would supply me with information.

11,303. Have you got it?—They have sent on what I have asked for.

11,304. Have your opinions and theories been based on information of that character?—No. Only recently I have taken the trouble to get certain information on specific subjects from such Associations. I have only asked for specific information on specific points I was in doubt about.

11,305. As you have never been down a mine or on the top of a mine, what estimate can you form of the character of a miner's work?—I form my estimate of the healthiness of the miners' work from the information given by Dr. Haldane as to the relative rates of mortality.

11,306. You mean judging the men's work by the mortality?—I thought you meant the healthiness of the work. I have enough imagination to understand it must be very unpleasant work to have to crawl along a thin seam.

11,307. You appear to have a varied and extensive imagination. I should like you to have a little less imagination and a little more knowledge of the facts?—In this particular case my imagination seems to have led me right.

11,308. Why have you come to that conclusion?—I thought you were confirming it.

11,309. In what respect?—That mining work is very unpleasant.

11,310. I have not said a word about it. I ask you if you know, as a matter of fact, what kind of work it is?—I certainly do know that work in mines is unpleasant, if that is what you want to know.

11,311. How do you know that?—You might ask how do I know anything; how do I know that Julius Cæsar ever lived.

11,312. It appears to be pretty obvious you do not know the character of a miner's work?—You might say I do not know that Julius Cæsar ever lived.

11,313. I am not going to say that. That is a matter I do not propose to go into, whether Julius Cæsar ever lived or not. I do know miners work hard, because I have worked as a miner and worked

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

hard?—Do you mean to say nobody ever knows anything about anything unless he has been there himself.

11,314. I know you do not know the character of a miner's work unless you work as a miner?—Then do you say I am not entitled to accept your statements, supposing I want information about mines or miners.

11,315. I want it on the notes that you do not know anything about it?—I do not see your point.

11,316. You will, in a moment?—If I come to you for information as to the character of miners' work, and you told me you have been a miner and worked and it was extremely unpleasant, believing you to be an honest man, I should accept that. Would you turn round and say, "You have no right to accept that"?

11,317. If you did, I should say, "Go and see for yourself"?"—I do not see your point.

11,318. I will come to it in a minute; do not have any fear of that. You know there are 1,000,000 miners engaged in the mining industry?—It is rather over, is it not?

11,319. Approximately 1,000,000?—Yes.

11,320. These men work hard?—Most of them, I should think.

11,321. I suppose they are entitled to have ideas?—I hope every citizen is entitled to have ideas.

11,322. Suppose I tell you that a large number of these million men have very definite ideas; not about wages; not merely about the conditions under which they work, but about the ownership of the industry in which they are engaged. Would you be surprised to hear that?—No, I have gathered the same thing from other sources of information.

11,323. That they have such ideas?—Certainly.

11,324. I noticed you quoted yesterday, I did not hear your proof read, some statements from a pamphlet entitled "The Miners' Next Step"?"—Yes.

11,325. I suppose you consider that a well-written pamphlet?—Do you mean from a literary point of view, or what?

11,326. No; as an expression that some people have ideas?—What are you coming to?

11,327. Is it a document that contains any ideas?—I thought it was rather full of ideas and nothing much else.

11,328. Indicating the man who wrote it had some sort of conception about the industry as a whole?—Will you tell me what you want me to say?

11,329. I want you to agree with me that there are men who are working hard in the mines who are beginning to have ideas about the industry in which they are engaged, whether rightly or wrongly?—I think it is quite obviously so, or you would not have had this agitation for nationalisation, which I think springs from false ideas and nothing else.

11,330. Having got you as an economist, I want to know whether you are cognisant of these things?—I thought that was implied in my statement.

11,331. I am going to give you a little information now which perhaps you do not know?—Thank you.

11,332. Among these 1,000,000 men, some believe in nationalisation with bureaucratic control?—I gathered that.

11,333. Others, the majority, believe in nationalisation without bureaucratic control?—I am glad to hear it is the majority.

11,334. There are still others who believe they ought to own and control the industry themselves?—Yes.

11,335. Without any relation to the nation?—So I gathered.

11,336. If those ideas crystallised in the near future and attempts were made to get either one set or the other accepted, which of those three would you prefer?—With regard to the middle one, I am not quite clear what the arrangement was to be.

11,337. The first is nationalisation with bureaucratic control?—Yes.

11,338. The second is nationalisation without bureaucratic control?—The question is how it is to be controlled.

11,339. The third is no nationalised ownership at all, but the ownership of the property by the men

actually engaged in it. Those are the three different conceptions?—I do not like one or three. Will you tell me how two is going to be worked?

11,340. I am not going to tell you how the second is going to work. That is the idea prevailing in the miners' minds?—If they have that idea they must have some idea how to exercise the control. It is not to be the control of the miner, nor the control of the bureaucracy; whose control is it to be?

11,341. It does not matter what ideas they have as to who is to take the control. They say the State or the bureaucracy shall not do the controlling?—Yes.

11,342. If you have to choose between those three alternatives which would you accept?—I cannot give you a judgment until I know what the second alternative is.

11,343. Do you believe the last is a good proposition?—No, I do not. I think it would be very bad from the point of view of industrial and commercial efficiency for the men to try and control the industry themselves, and it would be extremely unjust to the nation.

11,344. Therefore it is something to be avoided?—Yes, I think so.

11,345. Why should not the men control it themselves?—I do not think they have the ability. I do not think a Committee of workmen has the ability to manage a difficult industry and a commercial proposition.

11,346. You do not think so?—No, I do not think so.

11,347. What ability have they got?—They have varied abilities. I do not think a group of workmen have that particular ability. I do not think a group of any people—I am not depreciating the miners above any people; I think very few people have a commercial instinct; it is rather a rare thing.

11,348. The workmen have never had an opportunity of, in effect, demonstrating whether they have the ability to control the industries in which they work?—Yes, they might during the war. Many offers have been made to trade unions to take over industries.

11,349. Which cases?—Several cases have occurred.

11,350. Give me one in point?—I cannot give you particular instances from memory.

11,351. You have made several generalisations of that description. When Mr. Smillie asked you to specifically state a case in which the owners had voluntarily introduced a life-saving apparatus or life or limb-saving apparatus you could not give a specific case?—Do you mean to say you deny mine-owners have ever introduced voluntarily life-saving apparatus?

11,352. In the absence of proof I come to the conclusion that no owner has voluntarily introduced any life-saving device into his concern, and Mr. Smillie asked you for a case, and you cannot give one?—I cannot give a specific case from memory.

11,353. I ask you for a case in which the workmen have been invited to assume control of a particular industry?—I am quite certain I have seen in the papers more than once statements that suggestions have been made that Trade Unions should take over particular concerns.

11,354. I may take it you are unable to supplement that?—Yes, I have not troubled to collect instances. At the present moment there is nothing to prevent the miners, if they wanted to buy a mine, from buying.

11,355. Out of what?—With their Trade Union funds or any other funds.

11,356. Do you think they have enough money in their Trade Union funds to buy a mine?—If they are so keen to run a mine they can open up a mine.

11,357. Why should they buy it?—Because it is the duty of people to respect the right of property.

11,358. You believe in the rule by majority to some extent?—I believe majorities can sin as much as minorities.

11,359. As a democratic principle that is right. Who has the most right to run the mining industry—the miners?—It is not a question of right; it is a question of effectiveness.

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

11,360. It is a question of right?—If the miners like to buy a mine at the market price and run it themselves let them do it by all means.

11,361. Do you think miners are such arrant asses to put themselves in competition with the whole world of capitalists?—If they want to run a mine let them buy one by all means.

11,362. The whole world of capitalists would be their competitors. That is all. I think they have exercised extraordinary sanity in not doing so? You say they have displayed sanity in not putting their theory to the test?

11,363. In not putting themselves against the whole of the capitalists generally?—You miss the whole point. My proposition is that one capitalist is pitted against another, and it is absurd to suggest that all capitalists would combine together against a trade union engaged in running a mine.

11,364. Come to the question of the risks that the large number of workmen are exposed to. You are aware there are between 160,000 and 170,000 injuries per annum in the mining industry?—I know the risk of life is very serious.

11,365. Is the risk of life comparable with the risk of capital?—The two things are not on the same plane; you cannot compare the two.

11,366. A man who puts £1,000 into a mine is not running any risk compared with the man who works there daily?—It is a different kind of risk.

11,367. Surely the monetary risk is not in the same category?—We agreed that before.

11,368. That is exactly what I want to point out. If you agree money or capitalist risks are not comparable with the risks of human life, surely it is the men who put their lives into the industry that ought to have the prior right to control that industry?—Why?

11,369. You agree?—I do not. You might equally say because a soldier risks his life in going over the trenches he ought to have a voice in directing the whole army.

11,370. I say the soldier who risks his life for his country has a perfect right in taking a governing part in that country?—He does do that already.

11,371. I want these things clearly understood. I think it is you who are the exponent of individualism?—I will not go so far as to say the exponent. I would like the word "an" instead of "the."

11,372. You are an exponent of individualism?—Yes.

11,373. I suppose your philosophy would not count against the determination of a million men?—That is exactly why I object to any such centralised organisation as the Miners' Federation because it can hold the nation to ransom against reason.

11,374. Let us analyse that. In what particular has that ever occurred?—I think during the war and at the present moment the Miners' Federation are putting forward a claim that is against reason in the sense that reason does not justify them on the ground of justice.

11,375. Give us your point?—The demand for an increase of wages and for further reduction of hours puts the miners in a better position than workpeople in other industries.

11,376. Wait one moment. You are referring to the period of the war?—I refer to the present claim.

11,377. You mean a case in which the miners have been opposed to public interests, and the opposition is unreasonable?—I say their present claim is opposed to the public interest.

11,378. Prove it?—This present claim is to put themselves in a far better position relatively to the rest of the community than I think they are entitled to be put in.

11,379. See whether it is reasonable, if their present claim is to absorb the whole of the existing profits there would be no private capitalist; is that unreasonable?—That, I think, would be unreasonable in itself. That is not the issue.

11,380. There are other issues. We will confine ourselves to that one. Suppose the miners decide that it is a perfectly reasonable proposition as they risk their lives in the industry and they represent a majority of the industry, that they should absorb in wages the whole of the available profit now taken up by

those who are not engaged in the industry, would that be unjust and unreasonable?—But who are paying their wages and guaranteeing them their wages?

11,381. The people who pay the price for the coal in the long run?—In the first instance, it is the capitalist who provides the money for the workers' wage.

11,382. Where is he getting the capital from?—From his savings or his father's savings.

11,383. What represents capital?—Savings; it is the difference between what you spend and what you earn.

11,384. If you have a million pounds in the bank, it is not capital at all?—Why not?

11,385. Because it does not function an industry?—Can you show me a banker who keeps £1,000,000 idle?

11,386. There are millions of pounds kept idle?—If there are many bankers who do that there would be no business, but bankruptcy.

11,387. You and I are coming to agreement, really?—We are a long way off it yet.

11,388. I want to convert you?—I am quite open to conversion.

11,389. I am confining you to my own proposition. I am assuming we are not going to allow any profit to be made in this industry, because the profit goes to people who do not work in the industry. Is that unreasonable?—Yes, I think it is most unreasonable.

11,390. Why is it unreasonable?—Because in order to get an industry active you must have three things: you must have capital, you must have brain power, and you must have manual work. Those three things are all necessary. If you destroy the profits of capital you will not get any more capital.

11,391. We have had a lot of academic discussion?—You started it.

11,392. I am keeping you to an idea that the miners have that it is wrong for people to make profit out of their labour. They say, "We will prevent that from now onwards; we will absorb all the profit, and we will increase our wages to the point where the least fraction of profit is absorbed." Why, is that really unreasonable?—It is unreasonable because you will not get any more capital.

11,393. Why would you not get any more capital?—Because people are not going to save unless they can make a profit on their savings.

11,394. Supposing the renewal of capital is all provided for?—How?

11,395. The profits, for example, are not ascertained until they have set aside a certain amount for a sinking fund?—Yes.

11,396. Assuming that funds are still set aside for the replenishment and renewal of capital in the industry is it wrong for the worker that the great margin profits should be absorbed by men who work in the industry?—Yes, it would induce other people to put capital into other things. If I had ever been foolish enough to invest money in a mine I should expect to get some return out of it. If I got no return I should not only put no more money in, but advise my friends the same.

11,397. If you rush to put the money into another industry what would happen?—That other industry would develop relatively to the mine.

11,398. You may bring down the rate of profit by increasing the accumulation of capital. For that reason, I am pleased to see large profits; they encourage people to save more capital and you get capital cheaper in the long run.

11,399. Would you think a case of this description would make a man a rebel, if you like, against the existing institution. Supposing he has a little grocer next door to him who put £1,000 into the Powell Duffryn Colliery Company, he is already making a comfortable income as a useful member of the community as a grocer, and he puts this £1,000 into the Powell Duffryn colliery, where they pay in the year, say, 25 per cent. That grocer gets £250 upon his £1,000 invested, and that would represent more than the wages per annum of a hewer of coal in the Powell Duffryn concern?—Yes.

11,400. What sort of psychology is likely to be created by that?—You will have a number of other people putting their money into coal mines and you get capital much cheaper.

25 April, 1919.]

MR. HAROLD COX.

[Continued.]

11,401. What effect has that on a man who goes through a year and labours and gets less than the man who puts £1,000 in and does not labour?—If a man looks at the facts immediately under his eyes, as most of us do, he would form an evasive view of that and perhaps an angry view. If he looked a little longer ahead he would see the fact that the grocer had made a large profit by investing, it would encourage people to put other capital in; the capital would become cheaper and there would be a larger margin for wages to rise.

11,402. You do not think that would have an irritating effect on the worker?—I think that people who have been educated ought to take a longer view, and ought to tell the miner the ultimate effect, and his unjustifiable irritation would then disappear.

11,403. You think it is a right thing that a man who does not work should have more than the man who works?—It is the right thing that a man who speculates in risky undertakings should occasionally win a large profit.

(The witness withdrew.)

(Adjourned for a short time.)

PROFESSOR WILLIAM ROBERT SCOTT, Sworn and Examined.

11,404. *Chairman*: I believe you are a Master of Arts, Doctor of Philosophy, Doctor of Literature and Doctor of Laws, and Adam Smith Professor of Political Economy in the University of Glasgow, and Fellow of the British Academy?—Yes.

Chairman: The Secretary will read your proof.

Secretary:—

"The organisation of the coal industry should be such as will provide for its progress both internally and externally—internally in securing more harmonious relations amongst all those managing and working it, and externally in keeping the cost of production low, on the one side in relation to the export trade in coal and on the other in the supply of this commodity to industrial and private consumers at a moderate price. Also the provision of capital for future improvements must be kept in view, as well as the type of organisation which will be most favourable to the providing of the ideas and inventions which form the prior conditions of progress.

The Economic Unit of Organisation in this Industry.

Amongst these related problems, the economical unit of organisation is in some respects the most important. While the determination of this unit is not decisive directly save as regards efficiency of production, indirectly it offers the best opportunity, when other circumstances are favourable, for internal harmony, for progress in the industry and for growth of invention. It is only by means of the most efficient and progressive production that shorter working hours can be maintained and at the same time further improvements in the condition of those employed can be effected and continued.

The varying size of existing coal mining enterprises points to a certain degree of doubt in the minds of those controlling them upon the size of the economical unit beyond the variations which might be accounted for by differences in local conditions. The fact that coal mining is an extractive industry would point to the economical unit being of moderate size. On the other hand, in so far as it includes, or has associated with it, certain processes, such as the utilization of waste products, which conform rather to the principles of manufacture, to that extent the economical unit of operation would tend to be enlarged. Another series of considerations enforces the same view, namely, that, in general, when the scale of operations is being extended, this is accomplished most successfully when it proceeds by steps and not by great strides. The experience in managing concerns of moderate size is liable to be incomplete when it has to deal with a unified enterprise, say, fifty times as great. Managers, who have been trained in companies with a capital not exceeding five millions as is the case in the British coal mining or coal distributing enterprises, are liable to be at sea when the scale of operations is suddenly increased to a magnitude which, in coal mining alone, has been variously valued at between one hundred and two hundred millions, and would be still greater if coal distributing were included in a proposed national trust. A sudden jump in size, though of less extent, was one cause of the difficulties encountered by the large combinations formed amongst manufacturing firms in 1899 and 1900. No doubt the experience gained in the control of the

coal trade during the war is a consideration on the other side, but that experience is of limited value, being based on the highly artificial conditions which called it into being and under which it worked. On the whole, while the precise determination of the economic unit in coal mining is largely a technical matter, the present line of argument would suggest that, in existing circumstances, all the economies which have been advocated could be secured in a unit of moderate size which need in no case exceed that of a coalfield and which probably might, with considerable advantage, be smaller. There is another aspect of the coal industry which would appear to indicate a still larger unit, namely, the ownership of railway waggons by coal companies, which results in non-interchangeability of these waggons. The solution here would appear to be the standardisation of coal waggons and the ownership of these by the railway system of the country.

Aspects of the case for Nationalisation.

The size of the economical unit may or may not be related to the question of public ownership. It is worthy of note that the latter course is being urged upon contradictory grounds in this country and in Germany. Here it is often contended that nationalisation is desirable to prevent the waste from the competition of numerous independent concerns, whereas the Reports of the German Socialisation Commission urge the same course but from the contrary point of view, namely, that coal mines are a monopoly. Even when all due weight is given to differences in conditions as between the two countries, both reasons, being contradictory, are not maintainable at the same time. The Germans would nationalise coal mining because there is too little competition, while in this country the same course is advocated because there is too much, and it is alleged to involve avoidable waste. As regards the British point of view, though it is the fashion to decry competition, it is, on the whole, the best method for relieving the industrial organism of parts or functions which have become effete. Certain aspects of this circumstance will be alluded to below.

Mr. Straker, in his evidence on March 14th, advanced various arguments for nationalisation of the coal industry. These fall under two heads, first, such as relate to economies in production, and secondly, those which are psychological or ethical, though they have a distinct economic reference. It seems to me that most of his claims under the first head might be obtained by a reorganised industry, and that the question of organisation is more important than that of ownership. The second line of argument is different. It contends that nationalisation would give the miner greater safety, better provision in case of disablement, better terms for his dependants in the event of death from accident in the course of his occupation, a sense of responsibility through a share in the management of the industry, and the feeling that his work is for the benefit of the community, not for private profit. The general public, alike on social grounds, and in its own ultimate interest, should welcome all precautions for the safety of underground workers, and as far as can be judged, it is disposed to assent to the necessary steps being enforced. Whether these precautions would be effected more surely by

25 April, 1919.]

PROFESSOR WILLIAM ROBERT SCOTT.

[Continued.]

nationalisation of the mines or by legislation with augmented inspection is difficult to determine. The last two considerations (namely, a share in the management, and a direct consciousness of work for the community) seem to cohere together. It follows that the nationalisation intended is not merely nationalisation as such, but nationalisation of a certain particular type. Thus the coal industry might be nationalised under a Minister of Mines, as has been frequently advocated in recent years. But such a Ministry might be established to own and work coal mines without the miners having a share in the control. The scheme of Mr. Straker is of a different nature, and provides for a Mining Council, of which the Minister of Mines shall be permanent Chairman, while the remaining ten members are to consist half of nominees of the Miners' Federation and half of nominees of the Government. Two of the latter are to represent the interests of consumers. From the aspect of administration the position of the proposed minister would be difficult. He would be responsible to Parliament, but without being able to make his views prevail in the Council. That is, he would be in danger of having to bear the responsibility before Parliament for decisions which might not be his. Further, Parliament would have provided public moneys for the purchase of private interests, while under this scheme it would have relinquished control over the administration of those funds. In addition, if the proposed Council could surmount these difficulties, the representation of consumers is too small, since the latter are largely unorganised and their interests would suffer in the face of the compact group of delegates of the Miners' Federation. Necessarily the latter matter is capable of adjustment, but the divorce of responsibility from effective control in the case of the Minister of Mines is a serious difficulty, and one that is fundamental. At the same time, whatever form of organisation may be adopted, it is desirable that those employed in all occupations connected with coal mining should be in a position to be associated with the management.

The Consciousness of working for a State-owned Undertaking.

The estimation of a state of consciousness, which has not yet been experienced, is always difficult, and, when that state of consciousness will be one in the minds of about a million individuals, the anticipating of its effects is subject to great uncertainty. Accordingly, it is only possible to endeavour to forecast anticipated results which must be largely hypothetical. In the first place the formulation of this desire is highly laudable. It represents the ideal of public service, which has inspired many who have deserved well of their country. It would have the effect, if realised, of improving the internal harmony of the industry, and increasing its efficiency by tending to increase the productiveness of a given quantity of labour. This is the favourable side of the prospect. There is, however, another. In normal times when consumers complain of the price of coal, their efforts to obtain a reduction are dissipated between the mine-owners and the miners. The former urge, as a justification of a given price, the high wages they pay, the latter the high rate of profits the owners receive. Under a system of nationalisation what might be called the "punching ball" of owners' profits would disappear, and the consumer and the workers of all kinds would be left face to face. Unfortunately it might happen that the consumers' valuation of the miners' service to the community would be lower than that which the miners themselves placed on it and the tendency would be for the driving force of this ideal to be weakened. In the case of serious friction it would be likely to disappear. Much as it is to be regretted, these are probable conditions which must be faced frankly. Indeed, to some extent the combined effect of Excess Profits Duty and the Coal Mines Excess Payment was a distinct step towards realising this claim of service to the State, since the effect was that all profit in excess of the pre-war standard, save one-twentieth, was placed at the disposition of the Coal Controller and the Exchequer—thus control in this industry accomplished the feat of establishing an Exchequer of considerable amount and transferring the odium of it to the mine owners.

Again, whatever may be possible in the future, it must be recognised that to the present there has been a tendency for State employment to induce gradually and almost insensibly a species of creeping paralysis in the efforts of the workers. The "government stroke" amongst manual workers has been a result of State employment against which the spirit of service to the community would have to contend, and there is little, at yet, to show that the former would succeed in counteracting the latter, still less that it would overcome it.

On the whole, upon balancing these uncertain factors, it follows that under this head the presumption in favour of Nationalisation may be increased, but to an extent which, as far as can be judged, could in no case be great, and which in certain circumstances might be almost inappreciable.

The Effect of Nationalisation on Initiative and Enterprise.

There are other factors which enter into the probable consequences of Nationalisation. Prominent amongst these is the effect it would have upon individual initiative and enterprise. In the industry of producing coal, room for both these will remain and will be urgent. There will be a greater need for improved methods of coal-winning, and great judgment and enterprise will be required in the export trade. In the industry of distributing coal these qualities will be less necessary. It is not enough to assume that the nationalised industry will employ the best managers of the former Coal Companies. In the first place there would no doubt be a number—and those the most enterprising—who would dread the constraint and routine of public management and who would take their capital to overseas coal-fields or to other industries. Whether the number of these was large or not, the case of those who remained is more important, and, though the men would be the same, it does not follow that their efficiency would be equal under the two systems. Hitherto, public management has tended to be more rigid than enlightened private management, and hence it is repressive of initiative and enterprise. There are several reasons for this tendency. The man who has a new idea has the choice of many firms to which he may offer it. In a nationalised industry he has only one chance. If his idea has a reasonable prospect of success, there is a much greater prospect that some private firm will adopt it, and out of the large number of trials of this kind, the great and the small successes represent the survivals which benefit the industry as a whole eventually. Many of the great inventions have been the discoveries of men who believed in the idea in spite of universal discouragement and who risked all that they possessed and could borrow in working it out in practice. Within the sphere of public ownership, progress in invention and improvement in methods would be slower than when enterprise is free. In existing circumstances, in so far as they touch industry, Government has been non-creative, and where (as has been shown by Dr. Marshall) inventions have resulted in State-managed enterprises, these have been the work of men who were trained under competitive conditions. Whether these conditions will be permanent or not, it is impossible to say. Under normal circumstances public undertakings are not disposed to take the same risks that private businesses will undergo. On a broad average, while many of the latter risks do not achieve success others will, and it is from the joint action of the failures and the successes that progress results. From this point of view, in so far as the need for improvement in the coal industry is established, to that extent the necessity for private enterprise in it is demonstrated. On the other hand, in abnormal circumstances a public undertaking may be forced into taking large risks, and, as a rule, it assumes these with less judgment than private enterprise does. In this connection the experience of public control and of national industries during the war has been too recent, and as yet there are no official reports of impartial inquiries into its results available from which a reasoned judgment could be formed as to this period. Such information, had it been available, would have afforded some light in the present circumstances.

25 April, 1919.]

PROFESSOR WILLIAM ROBERT SCOTT.

[Continued.]

Closely related to invention and new ideas are initiative and judgment. Hitherto, the checks, which are judged necessary in public control, have been inimical to initiative. This is generally admitted, and the complaint is repeated in detail by the German Commission on the Socialisation of Coal Mines, in respect of the State owned mines in that country. Routine, instead of enterprise, seems to be the watchword of public undertakings. Their enterprise, when this course is risked, has often been more unfortunate than their inaction. Judgment in industrial enterprises is even greater in its effects than initiative, but the conditions which develop this quality have been analysed only imperfectly. The British belief in character and its absence of self-expression have left the faculty of judgment in industry almost altogether inarticulate. There is no doubt that some men have an almost uncanny power of anticipating correctly coming changes in conditions of the industry with which they are concerned, but their power of explaining the reasons for their opinion is limited. Under conditions of public ownership their want of the power of expression and explanation would deprive the community of the greater part of the advantages of their special endowment. The tendency would be to retain such men in inferior positions with a resulting loss to the industry and to the community.

In the present stage of social evolution, it appears that the faculties and general type of mind which are required for political administration and for industrial leadership, are quite distinct. Under the present system, each sphere tends on the whole to attract to it those who are most fitted for it. Under nationalisation, the tendency would be for the administrative type to oust the industrial type, with the result of the various disadvantages which have already been enumerated. As regards general social progress, these disadvantages would first affect the particular industry nationalised; but, on the assumption that several industries were thus dealt with, these disadvantages would increase cumulatively and progressively as the field for initiative, invention and judgment was contracted.

Thus the general conclusion under this head is that nationalisation, under present circumstances and in the future as far as can be foreseen, would be inimical to enterprise, initiative and commercial judgment.

Probable consequences of the Removal or the Decrease of the Reward obtained by private Capital.

Several consequences may be anticipated:—

(1) As regards the capital at present employed in coal mining and coal distribution, if this were expropriated, it is to be assumed that the stock holders and shareholders would receive in exchange a stock issued by the State. The effect of the lower interest on the latter would be different in the case of debenture holders and preference shareholders as compared with ordinary shareholders. As regards the first two classes (when there are profits remaining after this fixed interest is paid) the holders have deliberately sought a lower rate of income on condition of less risk. Upon an exchange being made into a Government stock, they would obtain a better security at a sacrifice of a part of their previous income if they continued to hold the Government stock received in exchange. Since the reduction in income might not be striking, it seems possible the majority would hold the Government stock, while a minority would sell it and re-invest in Debentures or Preference shares of other companies. The case would probably be different with reference to the owners of ordinary shares. Owing to the risk to which this class of security is subject, the difference between the yield on this and on a Government stock is much wider. On general grounds, it seems possible that over a sufficiently long period the yield on the aggregate of all ordinary shares and of all capital invested in the industry by individuals and partnerships would not be more than would suffice to afford normal interest for the period and make good wastage of capital (where this has occurred). The difference is that the investor of greater foresight expects to improve on this average, while another, whose acumen and judgment is less, will lose. This would be impossible if all those holding ordinary shares in coal companies

continued to hold the Government stock they received in exchange after they were expropriated. In normal times the exclusion of such a large amount of capital from one type of hazardous enterprise would lead to investment in other concerns of the same class and would increase the demand for such investments, probably resulting in calling forth a supply which would include some undesirable promotions. In the abnormal circumstances of the immediate future owing to the new factors of uncertainty caused by the war, it seems that the element of risk in very many businesses has been increased, so that the amount of capital which would seek now investment in which risk was involved (through its having been extruded from the coal industry) would not be sufficiently great to produce a marked effect over a moderate period such as a year. The case would be different, if several industries were nationalised, when the effect would be cumulative.

(2) The transformation of stocks and shares in coal companies into a Government stock would have another effect arising out of the increase in the quantity of the latter. In so far as recipients of the new stock sell it in order to re-invest, to that extent the quantity of Government stocks of all kinds on offer will be increased. The result will be a counteractive tendency towards the reduction in the quantity of these stocks to be anticipated from the operation of the Sinking Fund. Thus *pro tanto* the improvement in national credit would tend to be neutralised to the degree to which these sales are made, and it follows that to this extent the price of Government stocks would be lower than would otherwise be the case. As a result, the country would secure less favourable terms for renewal of its loans when the time will have come for this operation.

(3) The formation of capital depends on the appeal which the income obtainable offers to different temperaments and to persons in different situations. Some demand security and low interest, others larger interest at the expense of less security. If the amount of investments of the latter class is contracted, some prospective savers will be excluded. The removal of the investments offered at present by the coal mining industry would have some effect in this direction through a part of the capital expropriated seeking re-investment where the risk was approximately similar. If the industry of coal distribution were also nationalised, that effect would be accentuated. If the railway industry were nationalised likewise, the consequence would be much more marked. In fact each fresh nationalisation would have a cumulative effect. The general result would tend to make British Government stocks cheap and to make the more speculative stocks dear.

The Supply of Capital for a Nationalised Coal Industry.

If this industry were nationalised, it would require capital in the future in order to effect improvements. It would also need to provide for the wastage of the original capital with which it started. The cost of opening up a mine and of the underground workings is lost when the coal seams in that particular area, reached by these workings, have been exhausted. Hence depreciation of capital, based on the life of a mine and a provision for obsolescence, to provide for the renewal of plant when it is superseded by a better invention, are both desirable and, in this industry, indeed necessary. Depreciation should not exceed these limits; and new capital, as needed, is best obtained by the issue of stock. Such new capital would probably be obtainable with comparative ease. The danger is that depreciation may be inadequate, and capital may be created to provide for charges which should have been met by depreciation. The more the industry were autonomous, the greater it seems would be the risk that adequate depreciation might be neglected. Miners on the one side and consumers on the other would both attack the apparent surplus which would remain after paying the usual working expenses and interest. If this result followed, capital would be raised to meet charges which should have been met from revenue and the total capital would be inflated. As time went on the amount which the winning of coal would have to bear for interest would be increased unduly.

25 April, 1919.]

PROFESSOR WILLIAM ROBERT SCOTT.

[Continued.]

SUMMARY.

The foregoing discussion results in a balancing of alternatives, some of which are in favour of Nationalisation in the coal industry, and others against it.

1. In the future organisation of this industry, Nationalisation would present too sudden an enlargement in the scale of operation. Those entrusted with the management would be required to magnify the size of their enterprise suddenly; and, as a result of their want of experience in new conditions, mistakes would be inevitable.
2. On the assumption that coal waggons will be provided in future by the railways, the economic unit of working is much smaller than the whole country. Accordingly, both these considerations raise a presumption of a certain amount of weight against Nationalisation. Under existing conditions in the coal industry, Nationalisation would create a unit of working which was neither the most economical technically, nor administratively.
3. On the other hand in so far as Nationalisation would increase harmony of working by inculcating an ideal of service to the community, there is a presumption in favour of Nationalisation. The degree of weight to be assigned to that presumption is difficult to estimate. Service to the community has to counteract the influence of the "Government stroke." The former is made to depend upon a form of Nationalisation which is open to objection upon the accepted principles of the responsibility of Ministers to Parliament. However, Nationalisation might be established, there are difficulties. If a Mining Council be established, as suggested by Mr. Straker, the Minister of Mines would be responsible for it in Parliament, but he would not control the administration for which he bore that responsibility. While it is desirable that those employed in mines should be associated with the management, this device would encounter many difficulties. On the other hand, a Minister of Mines working under similar conditions to the Postmaster General would fail to meet the miners' claim for a direct share in the management, and this type of administration would feel the influence of bureaucratic methods more and more as time went on. Balancing these various doubtful and highly hypothetical considerations, it would seem that the ideal of service to the community affords a presumption in favour of Nationalisation, but not to any great extent.
4. Indications are clearer that Nationalisation would react unfavourably upon enterprise and initiative. This consequence would manifest itself in the industry nationalised, more as time went on, and it would grow as the sphere remaining open to these qualities was contracted by the Nationalisation of other industries. These are considerations to which considerable weight must be assigned.
5. The consequence of Nationalisation of the coal industry upon the reward earned by private capital would have minor effects which would be adverse to Nationalisation, in so far as this process would tend to exert an effect towards diminishing the formation of capital by one type of possible savers, and also in tending to reduce the price of Government stocks. At the same time the effect of the Nationalisation of the coal mining industry, if that were the only industry nationalised, while it would be perceptible, would not be marked. But if other industries were nationalised also, the cumulative effect would be considerable and prejudicial.

Thus it results that the balance inclines rather decisively against Nationalisation. The disadvantages are known and increase progressively. The advantages claimed for it are of a speculative nature. In existing circumstances, Nationalisation of the coal industry involves a large gambling element. No doubt the immediate circumstances of the country will require schemes involving large imagination and constructive industrial leadership. At such times there is always the danger of megalomania, and a reliance upon undue extension, instead of intension of conception and effort. Experience of the past (and still more the late experience during the War as far as it can be read) shows that, as has been well said, "projects of great and sudden changes are now, as ever, foredoomed to fail and to cause re-action." In view of the very large number of firms in the coal industry, the unification of all these would be too violent and abrupt. Even if a case for Nationalisation had been demonstrated (which in my view has not been accomplished) practical wisdom would suggest the accomplishment of it, not suddenly, but by stages.

CONCLUSIONS TO BE DRAWN FROM THE NATIONALISATION OF COAL MINING IN GERMANY.

The evidence afforded by the State mines in Germany is defective in several important data. The available information may be examined under the following heads.

1. *The effect of Cartels and Syndicates.*—These in appearance, at least, make the task of nationalisation easier, since organisation had been developed already into very large units. At present the Coal Syndicate is linked up with the corresponding organisation of dealers. It has been objected to the methods of this Syndicate that its policy of making long contracts for the sale of coal presses hardly on the manufacturers of finished goods who purchase coal under these contracts. The manufacturers find themselves during a period when prices of their product are falling, faced with high fixed charges for coal which they cannot escape, and this occasioned much difficulty during the crisis in Germany from 1900 to 1902. Owing to the inadequate representation of consumers on the proposed Imperial Coal Council this disability of the manufacturing industries which depend on coal will certainly not be lessened and it may be increased.

Perhaps what is most important under this head is the degree to which the existence of the Syndicate may appear to facilitate socialisation of the coal industry in Germany, and the absence of a corresponding organisation in this country.

2. *Labour conditions in German State mines.*—In the Saar mines Dr. Herbig (Inspector of Mines in Saarbrücken) considers the chief factor which prevented these mines from affording an adequate return on the capital was to be found in various elements connected with labour, such as the wage policy which relied less on graduated wages than the private mines and to the effect of social policy in relation to labour. As regards the first more recent returns show that the earnings of the Saar miner in 1913 were less than those of the Ruhr miner. The same discrepancy continued in 1916 and 1917—the difference in favour of the average in the Ruhr district being 25 per cent. in the former year and 14 per cent. in the latter year. It might be thought that the advantages in working conditions such as greater security of employment, payment during illness and when engaged on public duties and other similar advantages would compensate for the lower money wage, but the opinion of Professor Paul Weiss, recorded some years ago, was that "in Prussia the State has shown itself the hardest and least indulgent of masters," and this view is confirmed by the emphasis with which the representatives of the miners at the Commission on Socialisation of coal mines repudiated the form of nationalisation which had existed previously as having manifested "such startling examples of this cumbrous State Organisation that there cannot exist a particle of doubt as to the necessity of a radical change."

25 April, 1919.]

PROFESSOR WILLIAM ROBERT SCOTT.

[Continued.]

3. *Output of State mines in Germany.*—In terms of the output of coal these mines have not maintained their position relatively to private undertakings. According to the figures of Dr. Jungst (*Economic Editor of Glückauf*) while the output of State mines increased $2\frac{1}{2}$ times in the thirty years from 1881 to 1911, that of private mines increased nearly $3\frac{1}{2}$ times. Or to put the matter another way, the proportion of the total coal production of Germany between 1881 and 1885 from the State mines was 17.62 per cent., but by 1911 it had fallen to 13.77 per cent. These figures however need interpretation and qualification. One object in the working of State mines was to secure a supply of coal for the State railways, and as far as that object remained an important consideration, the ratio of increase in the output of the State mines would be related to the expansion of the demand for locomotive coal. Also the failure to obtain a minimum return on the capital would necessarily restrict expansion.

The comparative figures in the output of coal per man must be admitted to be disappointing. In the five years 1881-5 the output per employee in the State mines was 249 tons, in the private mines it was 270 tons. The corresponding figures for 1906-10 were 229 and 258 respectively. Each quinquennium shows a deficiency in the output per employee, but the amount of it fluctuated. In the first fifteen years it averaged 25 tons, in the second fifteen years 15 tons. In the latter period there was great fluctuation. The deficiency was as low as 3 tons from 1901-5, but it rose again to 29 tons in the next five years, that figure being the highest in the period except in 1886-90 when it was the same. Necessarily many varied conditions have to be kept in view before basing conclusions on these results. There may have been less favourable conditions in the State mines, or more developmental work may have been in progress. Still, if one takes the Silesian mines which were long established, and where the State mines adjoin those of companies or private owners, the deficiency in the output of the public undertakings remains as great, whereas in the Saar mines the deficiency is on the side of the private concerns. Thus, there is no certain conclusion to be reached on this head, but the balance, as regards output per man, turns in favour of the private rather than of the public undertakings.

4. *Price charged for coal by the State mines in Germany.*—According to Dr. Jungst's figures, the price charged for coal by the State mines exceeded that of the remaining collieries during the thirty years from 1881 to 1910 by M. 1.57 per ton, and it is significant that the excess was greatest in the ten years from 1901 to 1910. In the twenty years from 1881 to 1900 it averaged M. 1.44 and from 1901 to 1910 M. 1.83. This difference is possibly attributable partly to the terms on which coal is supplied to the State railways, partly to the social policy of these mines, and partly to their unsatisfactory financial position.

5. *Finance of the State mines in Germany.*—There is considerable controversy concerning the financial condition of the Saar mines, into which it is useless to enter, since the capital cost is not available. It is otherwise with the mines in the Lower Westphalian coalfields, for which powers were obtained in 1902. As a recent example this operation may be taken as illustrating the financial side of the question.

The estimate of results turned out to be much too optimistic. According to the statement in the Budget Committee of the Abgeordnetenhaus in 1911 (quoted by Jungst) the capital account of these mines should not have been more than M. 81.66 mil. by the time they were estimated to become "paying concerns" in 1915, whereas at the beginning of 1917 accumulated losses had increased this sum to M. 183 mil. or double the estimate. The income is far from paying interest on the loans issued to provide the capital. Nor is this all. Henbig points out that pensions of the State officials, compensation for miners' dependants and certain other expenses are charged against other accounts and not against the State mining administration. So it follows that there is a treble loss—first in so far as general taxation has to subsidise the mines through their failure to earn the

full interest on the capital outlay, secondly in some mining expenses being defrayed from general funds, and thirdly in so far as it appears the coal is dearer than that of private undertakings. A subsidy to cheapen a commodity is, at least, intelligible, but one to make it dearer seems difficult to understand.

The latest Scheme for Socialisation of the Coal Industry in Germany.

In view of these considerations it is not surprising that the methods of nationalisation in vogue in Germany up to the Revolution now find few defenders, or even apologists, there. And it is remarkable that the type of Socialisation, now under consideration, is a complete break away from the principle of Nationalisation. In this respect the recommendations of the Minority Report of the Coal Commission have been largely accepted, particularly in so far as the ownership of the mines is left as it was and the owners enter into a system of joint management by being combined with representatives of the workers and of other interests. The Council of Exports with its membership of 50 has persons selected from no less than sixteen different interests. The proposed system may be described as "the way not to do it." It is simply as if the office of coal controller were put into commission, which would be equivalent to putting the coal industry into Chancery for an indefinite period. A management so diverse might secure an equilibrium of various interests, but it would be the equilibrium of stagnation. Under such a system there can be little hope of the progress which would otherwise be possible, nor is there a real reconciliation of the varied interests, since consumers have ludicrously inadequate representation. Once the owners and workers unite, as they might be expected to do in time, they would have a comfortable majority numbering at least 30 out of 50. Against this there would be only 10 members who might be taken to represent consumers.

The whole scheme, as far as it has been developed, seems to me to be completely chimerical. It must inevitably fail to satisfy the expectations which have been aroused; and, compared with this, the fears in Germany that such mechanical management will be powerless against the free initiative of Great Britain and that English coal may be sent by the Rhine to South Germany and Switzerland, or that the cost of distribution by the State would be as great as the profits made by middlemen in this trade, are of comparatively little account.

A suggested Experiment in Joint Ownership and Control.

The final conclusion seems to be that the best hope of the British coal industry is not to imitate methods which are self-confessed failures, nor yet to adopt others which are totally untried, and which carry the seeds of failure in them, but to try to make the best out of the system of free enterprise, individuality and initiative. The latter have their faults and weaknesses, and the path to progress lies in removing these as far as possible, not in risking the future of the industry in a gamble where the chances are against success. Some of the chief improvements that are possible have already been indicated.

To all this it may be replied that the miners say that they are convinced of the advantages of nationalisation, and that without some concession to their point of view reasonable peace in the industry is impossible. To this it seems to me there are several replies. Neither nationalisation nor socialisation would bring peace to the industry. The case for both is based on hopes which neither by itself can satisfy. The resulting dissatisfaction would produce a new era of perhaps greater unrest. It is like buying a respite from financial pressure by borrowing on a bad security which too often results in the debt maturing with desperate suddenness with compound interest. It is true that both experience and reasoning can only present probabilities, some of which have not a high coefficient of reliability. But the case on the other side is very much less substantial. This seems almost as far as economics will carry us, except to the degree that truth will in the end prevail. But the latter may be a comparatively long process, and it is reasonable to ask can nothing be done in the interval?

PROFESSOR WILLIAM ROBERT SCOTT.

[Continued.]

This again raises another question on which I do not feel competent to offer an opinion, namely, how far, as a matter of practical statemanship, is it judicious to meet an unwise demand of a large section of the people in order that they may learn by experience? If that question were answered in the affirmative, and I were asked, as a practical measure, how to give effect to the decision so that the experiment should be least disadvantageous to the country, I should be inclined to suggest that a coalfield should be selected, neither the largest nor the smallest, and which had an export trade or, alternatively, a sufficiently large area of coal which was comparatively self contained. The companies and other owners should be amalgamated into one company. The Government then would acquire compulsorily, upon terms as between a willing buyer and a willing seller, shares which would carry one-half of the voting power. The Government would next exercise its right of appointing one-half of the directors. These nominees could include representatives of the employees in mines and of different classes of consumers. This method would resemble closely that already adopted in the case of the Anglo-Persian Oil Company. It would have the advantage of affording as practical a test as is possible of the results of joint management and of giving the workers a share in the management. Also it would show whether such management with a favourable unit for working could maintain itself beside independent firms. If experience showed that the experiment was a failure it would be easy for the State to retrace its steps by selling its shares. The difficulty already mentioned in relation to efficiency, involved in the great jump from the present scale of operations to a completely nationalised industry, would be avoided. At the same time, while this scheme diminishes the difficulties which, in my view, are inherent in projects for nationalisation it does not altogether escape them. The interest of consumers would be inadequately protected, since their representatives could only secure a minority representation on the Board. Still, the existence of competition from the other mines would afford some compensation for them which is absent in other schemes. Also the selection of the coal area for this experiment would involve some difficulty in regard to the disturbance of shareholders who would have to sell half their holdings in order to carry out the plan. At the same time, as far as can be seen, they would sell at a time which should not be unfavourable to them. It would be essential that all precautions should be taken that the new concern should bear all its proper working expenses and neither less nor more. It would be important that none of its expenses should be borne by the State in any form. In enterprises into which the State enters this object is very difficult of attainment. Also, in the event of the railways being nationalised, it would be necessary to arrange that no preference in contracts for locomotive coal should be accorded to this undertaking in comparison with other collieries."

11,405. *Chairman*: Would you answer me one question. What is the exact distinction, if any, that you draw between socialisation and nationalisation?—Socialisation would include what we speak of in this country as joint control.

11,406. *Mr. Arthur Balfour*: Would you just tell us exactly what form of joint ownership and control you think would be workable?—What I have suggested is that if a working unit as suggested were fixed upon, which would probably be smaller than a coalfield, and if all the concerns in it were amalgamated into one company, then the State would purchase a half share in that. The State would exercise its right of appointing one-half of the directors. That would afford, under due safeguards, so far as I can see, a safe experiment as between the two forms, private enterprise and some form of nationalisation.

11,407. The State would really have half the voting power?—Yes, half the voting power; that is my point.

11,408. You would not desire the State to interfere with the management other than they were represented on the Board of Directors?—Yes, quite so.

11,409. You would leave the whole of the management of the mine to private enterprise?—I would not suggest in any way that this would limit any

of the existing powers of the State or interfere with the existing powers of the State as regards the safety of the miners or any conditions as regards their health or welfare.

11,410. Would your proposals meet the views of the miners? Would that satisfy the miners' view?—That I cannot say. It is designed to meet, I think, a good deal of it. They ask to have a share in the management..

11,411. And if the State owned half the management they would feel that they had a share in the management?—I would go a little further than that. I contemplate that the State would possibly exercise its discretion in appointing some actual miners to be directors or persons connected with the industry. I would include under that anybody who was a worker in the industry in the broader sense of the term.

11,412. As regards the management of the selling of the coal, the export trade, it would act like a private company?—That would be my intention.

11,413. In your proof you refer to the punch ball of owners' profits disappearing under nationalisation. Is it your view that when the mines are nationalised there would shortly be no profits?—No, that is not my view. In the present situation there are three interests involved, the consumer, the worker, and the owner, and the owner's profit at present, as it were, stands between the worker and the consumer. If the appeal against owners' profits was removed then the tension would probably be between the consumer and the worker.

11,414. That would tend to dissipate the profits?—No, that is not quite my point, if I may restate it. The idea is with reference to the harmonious working of the industry as between all concerned; and the conception that I am dealing with there is the allegation that if you remove owners' profits you would have a greater harmony. I point out, not definitely against that, but to some extent against it, if you remove owners' profits then there may be tension between the consumers and the workers, the consumers then becoming in fact the employers of the workers.

11,415. I quite understand that. Now under this scheme there would be no Minister of Mines, and no special mines department other than there is at present for inspection purposes and for carrying out the different Acts of Parliament?—That is so.

11,416. So that it really would be an investment in which the Treasury would have to take some control or interest on behalf of the State?—Yes, that is how it would work out.

11,417. So that it would really be the Treasury who would control the investment on behalf of Parliament?—Probably.

11,418. And the Chancellor of the Exchequer would have to answer for it to the House of Commons?—I think so.

11,419. You refer to the possibility of the removal of capital from this country if nationalisation were proceeded with on a very large scale. Would not that be a very serious menace to the workers of this country?—Well, of course, that all depends upon the magnitude of the outflow of capital, whether it was great or not. The menace is proportionate to the quantity, and that is very difficult to say.

11,420. You would then say that it is rather a grave risk to run without taking some intermediate step?—That is my point. I was working on other points in the same direction.

11,421. Your feeling is that if nationalisation were proceeded with on a large scale it would ruin confidence in the investment of capital?—I would hardly go quite so far as that, but it would be prejudicial to confidence in investment of capital and the formation of capital.

11,422. *Mr. R. W. Cooper*: In your suggested district or county company, supposing that there were Government nominees on the board of direction would they be free to act knowing that they were the Government nominees?—They ought to. I have never heard any objection as regards the freedom of action of the Government nominees on the Persian Oil Company Board.

25 April, 1919.]

PROFESSOR WILLIAM ROBERT SCOTT.

[Continued.]

11,423. Would they not always expect to receive some instructions from headquarters as to what line of action they should take?—I should not imagine so.

11,424. Assuming the Government put up the money for their half share, so to speak, in this county company, if more money were required to be raised how would you expect that to be provided?—In the ordinary way. The Company would then issue more shares, and it would give the right of allotment amongst the existing shareholders *pro rata*.

11,425. That would be the Government, you mean?—That is, the original interests would take up their half of the new capital and the Government would take up their half.

11,426. Do you not think there would be a good deal of difficulty and delay in inducing the Treasury to sanction the embarkation of more public money in that particular undertaking?—That all depends on how it turns out.

11,427. Supposing it was not looking fairly well but the owners' side of the Board were more courageous than the Government side of the Board, do you think there would be much chance of persuading headquarters in London to advance any more money?—I should think so. It all depends on the case that was put forward.

11,428. Do you think that any case put forward to a Government department suggesting the embarkation of more money in a speculative enterprise which was not promising too well, and which would involve the exercise of a good deal of faith in the future, would be likely to be successful?—That assumes that it is not going well.

11,429. I am assuming that. Some concerns are not going well at the moment but by investing more money, as often happens, an unpromising concern has turned out a success, but it is largely by the exercise of financial faith?—Possibly to some extent that may be a consideration against it, but it is not really very material from my point of view, because what I am suggesting is that it is rather perhaps a little bit against the general drift of my argument, but after the war I would go any length possible to try to get people to all pull together.

11,430. I quite appreciate that?—My point of view is that I should like to meet the miners to see the thing tried, and if those circumstances that you mentioned happened, that the private half of the concern had financial faith and the State had not financial faith, then that is satisfactory to me as affording evidence between the two kinds of management.

11,431. Yes, of course, having made the experiment you could not very well draw back?—I may be wrong, but it seemed to me that that was one of the advantages of this method that I suggest over these half-way house methods.

11,432. You mean as a sort of trial trip?—Yes.

11,433. Of course, you would expect that if the trial trip was not satisfactory to the State, but there was more faith in the other side of the direction for continuing the trip, they might then buy up the State and revert to the *status quo*?—I would assume in that case if the State were not satisfied, if it was prepared to admit that it would not succeed, then they would sell their shares. That is what makes it so simple.

11,434. I quite see the simplicity of it. Supposing, on the other hand, the financial result of the experiment was satisfactory to all parties, I should like to ask you, because I am trying to learn, assuming you have half your board workmen and assuming the other half are representatives of what I call the owners for simplicity, in all matters of management, I will take the production side of the concern first, in all matters of detail management and all matters of responsibility for the observance of legal regulations for safety, and so on, which would have the final voice in your suggested scheme?—The majority of the board.

11,435. But supposing the board are equal, who is to have the casting vote?—The chairman.

11,436. Who is to be the chairman?—The board elects the chairman. Of course, your point of view is that you might have a division.

11,437. Yes. I do not see my way through that difficulty.—Surely with a group of, say, a dozen or twenty British people got together trying to do the best for an industry to make a great national experiment, surely they could agree on a chairman.

11,438. I see the spirit in which you have approached the subject, and I should like to test it a little further. As you may know, unfortunately unreason often grows out of very small beginnings. You may have a small trumpery cause of friction arising between some one man and his immediate foreman. It is not tackled tactfully at the moment, it grows like a sore and bursts out. Supposing that happens would not the workers' half of this board of direction be in a very difficult position?—I think there is something to be said before that happens I should surely hope that we should have an organisation with Whitley councils, or something like that, that would be able to deal with it. I am assuming in addition to this that there would be the organisation that has been suggested already and that the Government is setting up all over the country for dealing with questions of that kind.

11,439. Then you think that by establishing something in the nature of what are popularly called Whitley councils at collieries either in districts or in the county, and by disseminating full and detailed information to the satisfaction of both parties, there would be a great chance of conciliation on both sides?—I think so.

11,440. *Mr. Evan Williams*: Am I correct in understanding that your view is that if a change has to be made it is fraught with so much risk that a cautious experiment must be made beforehand?—I believe there is a great deal of risk in making it.

11,441. And this, you think, is the most cautious experiment that could be made?—The most cautious and, in some ways, I think, the most promising, if you are going to have an experiment at all.

11,442. But it does not follow that you believe that a change ought to be made from the present system of individual private ownership?—That is a very difficult question to answer shortly. I think that there ought to be changes in the existing system of working. I think, probably, on the whole, that as things are at present—I am not saying a word about things in the next generation—but, as things are now, I have balanced it up as carefully as I can, and I think that the advantage does lie with private enterprise.

11,443. *Sir Allan Smith*: I should very much like to know whether you have had actually any experience of industrial experiments?—Not personal experience.

11,444. Have you ever known, or have you ever heard, that it is a cardinal principle that an industrial experiment will be a success provided that that which it is intended to prove is worth having?—I do not quite grasp the question.

11,445. If anyone wants to prove that something is good, they will prove that in the experiment; although the actual fact may be a failure, the experiment will be a success?—But that, surely, as I understand it, the whole country would be able to judge of?

11,446. The whole country might be able to judge, but the judgment might come too late. Supposing you start your experiment in the way you suggest, and supposing that experiment is a success, what it going to follow?—If it is really a success, then, probably the method could be extended.

11,447. If it is not a success, what happens?—Then it would seem to establish that there were certain advantages in private management.

11,448. Your conclusion is that if the experiment is not a success what would be the result?—That, then, the country would be more willing to settle down to make the best of private ownership.

11,449. But what has the country to do with this? The country, I take it, is making no demand. The demand is being made on behalf of the miners?—Pardon me, that is not the view that I take of it. The country is interested.

11,450. I did not suggest any question of interest. I suggested a question of a demand. By whom is this demand being made, is it by the country or is it by a section of the community?—It comes primarily from

25 April, 1919.]

PROFESSOR WILLIAM ROBERT SCOTT.

[Continued.]

the miners, the people who are working in the industry.

11,451. And remotely from whom?—Remotely, it comes from people who would wish to see peace in the industry.

11,452. Then, have you approached this subject from the point of view of some form of nationalisation being the only thing that will promote peace in the coal mining industry?—No, I have not.

11,453. From what point of view have you approached the subject?—I have approached it from the point of view that I think, on the whole, in the condition of things after the war, it is worth, in my judgment, making an experiment of the kind that I indicate.

11,454. And you have already stated, I think, that if that experiment is not a success you could depart from it and the State could sell out and return the mines to the private owners. On the other hand, if it is a success then it would be a stepping stone to something wider?—If it were a success it would show, I take it, that there was something in this claim that has been made for nationalisation.

11,455. I would like to ask you one further question; you have referred to the desirability of the owners and the workers being represented on the boards. You suggest that, do you not?—I suggest this, that the Government having purchased half of the share capital in this proposed company should nominate half of the directors, and amongst that half persons who had been workers might be included.

11,456. Then you also say that there are three parties to the industry, the owners, the workers and the consumers. You would also suggest that the Government should have in mind the claims of the consumers to serve on the boards of the companies?—Most certainly.

Sir L. Chiozza Money: Mr. Chairman, may I have your permission to raise again a matter that I attempted to raise this morning, and which I rather gather was misunderstood at the time? I think it is without precedent in these Commissions for a member of the public to rise and interrupt one of the Commissioners who is examining a witness and ask you not to allow the member to put questions on housing because it was irrelevant to the question of nationalisation. Mr. Frank Hodges rose at the same time, and consequently, when I tried to raise the question, you ruled me out of order, without, I think, appreciating the point that I wanted to put to you. It is a very serious matter if members of the public are to be allowed to actually intrude on a Commissioner who is examining and to suggest that what he is asking is not applicable to the proceedings. My object in rising before was to draw your attention to the fact, and to ask you to make it plain that a member of the public must behave himself.

Chairman: I am much obliged to you for raising that question. I quite agree with you in your last observation, that members of the public should behave themselves. I am sure they will do so. This is a very important question, and I can give this ruling: Anybody who wants to make a communication, will he please put it into writing and send it to me, and I will see if it is a communication that should be attended to, and if it is, it shall be attended to. It is a little inconvenient in the middle of the examination or cross-examination, for some member of the public—might I use quite a colloquial expression—to barge in: it rather puts the Commissioner off his stride. As I say, if they will kindly put what they have to say in writing, I will see that it is attended to. There is one other announcement that I have to make, and that is that on May the 1st, owing to some of the Commissioners having Government work to attend to, this Commission will not sit. May the 1st will be a Thursday.

11,457. *Sir L. Chiozza Money:* I have only a question or two to put to you. I think you said in your very interesting evidence that you thought that the result of nationalisation, if it were attempted, would be to drive capital out of the country?—Hardly so definitely as that: that some capital would be taken out of the country.

11,458. You fear it?—Yes.

11,459. Do you think it could be much worse in that direction than things were before the war?—I think one has to take into account the difference in circumstances. We were exporting capital in any case before the war.

11,460. That is what I mean. Do you know the facts with regard to the exportation of capital from this country before the war?—I have not the exact figures in my mind at the moment.

11,461. Do you know that the State has made an estimate that in the year 1913 four-fifths of the publicly subscribed securities of this country were colonial and foreign; are you aware of that?—I have a general knowledge of it.

11,462. It does not surprise you?—No.

11,463. Therefore, when you suggest that nationalisation might lead to the exportation of capital from this country, we already know that under private enterprise capital is exported in extraordinary quantities from this country; it could not be much worse, could it?—That was before the war.

11,464. Do you know that before the war there was a most extraordinary neglect of industry in this country: that money-lenders—I am not using the term in an invidious sense; but investors, as we call them—were putting their money abroad to get a higher rate of interest than could be got at home?—Of course that is a matter of dispute.

11,465. If it was not a higher rate of interest that they went after, why did they go abroad?—Some people said that this country was saturated with capital.

11,466. The war proves that we lacked all sorts of what are now known as “key” industries?—Several of them were not key industries before the war; they were not recognised as such.

11,467. Take the case of the chemical industry: is not that industry necessary to every country? In the case of one or two branches, or, rather, most of the branches, we were notably deficient?—I should not say so, as long as we could import freely.

11,468. Do you know that German capitalists came over here and set up coke ovens and invested their money there, while our own investors were investing their money abroad?—That is a point on which there is a great deal to be said, and I do not think it can profitably be discussed by question and answer.

11,469. But I am sure you do not mind answering the questions I am putting to you?—If I can answer them shortly.

11,470. Do you know that at Fieldmay there was a torpedo factory set up?—I do not know.

11,471. Do you know that that torpedo factory was set up with British capital?—I do not know that; I did not know these war things.

11,472. Do you know that torpedoes were made there, and that it was the base of supply for torpedoes in the Mediterranean?

Mr. R. W. Cooper: Are you referring to Whitehead's factory?

11,473. *Sir L. Chiozza Money:* Yes. Do you know that torpedoes that sank French and British warships were largely supplied by the factory that was instituted with British capital at Fieldmay?—I know that some of the armament firms had factories abroad.

11,474. Is it not unfortunate that British capital, which ought to be used here to set up factories, was actually being used in Austria and other places to set up armament factories which might be used against us, and which were used against us?—The whole question is much too large to be dealt with by question and answer.

11,475. Surely it is germane to ask you whether it is not leaving the country under a system of private industry?—I think what I said was that some of the most enterprising persons managing the coal industry might leave the country with their capital; I think that is the sense of what I said.

11,476. On that head you know that the managers are not the people who owned the capital of the mines?—I was thinking of people like managing directors.

11,477. *Mr. R. H. Tawney:* In the first place I understand that you propose to limit your suggested experiment to one coalfield?—That is so.

25 April, 1919.]

PROFESSOR WILLIAM ROBERT SCOTT.

[Continued.]

11,478. You realise that the origin of this Commission was a practical one, and that there is a considerable demand for some change from most coal-fields. Have you any suggestion to guide us as to how we should meet that demand?—Would not this meet it: is it not fair, with reference to that demand, to meet it to the extent of giving it a fair trial on a sufficiently large scale?

11,479. I only want to get at what you meant, what you mean is that we should tell the persons concerned that we are going to make an experiment in one particular area, and they must wait until we see the results: is that the suggestion?—Yes; I think that is not unreasonable.

11,480. I am not saying that it is; I only want to get it clear now as to this particular experiment itself. I think, in answer to the question, you said it would be a fair test, as between private enterprise and State ownership, did you not?—I would like to see it made an absolutely fair test.

11,481. In your proposition, is that quite an accurate description of it? For example, if you are to have a fair test between State ownership and private ownership, you must presumably have the State ownership as complete and as full as the private ownership is; but if I understand your proposal, while private ownership is to remain untouched, the State ownership is to be of a very qualified character, to the extent of half of the capital?—But as absolute as the private ownership.

11,482. I do not think you quite take my point. In coalfield A you are going to do nothing: you are going to leave private ownership as free as it is now; in coalfield B you are going to set up a new authority, half composed of shareholders and half composed of representatives of the State?—Yes.

11,483. By the results of the working of those two you are to decide the relative merits of State ownership and private ownership?—Not immediately and in full. If that represents an improvement upon things as they were before the experiment was tried, then it would justify itself, and possibly there would be an argument, or probably there would be an argument, for going further.

11,484. What I want to put is this. The result of your scheme will not, really, produce a fair trial of the relative merits of State ownership and private ownership. In coal-field B, where the practice is to be tried you are not going to have State ownership; you are going to have a combination of private ownership and State ownership?—Perhaps I expressed myself incautiously with reference to the previous question. What I meant to say was there would be a fair trial as between coal-field A and coal-field B.

11,485. Whatever the result, though it may settle the merits of your scheme, it does not settle the merits between State ownership and management. What you suggest is not State ownership and management?—Would it not establish this if there was a benefit from management of persons connected with mines that benefit would show itself and that would give a chance of going further?

11,486. I think that is quite an arguable point. I would like to put one or two points with reference to what has been asked you. I put it in the first place you are going by the scheme of joint control to really lose all the advantage private enterprise has and you are not going to get all the advantage public ownership has. Consider, for example, the point of view of the workers in it. One argument advanced for public ownership is that the attitude of the workers would be different. That, of course, may be disputed. I do not wish to raise that point. But you will observe that under your scheme there is really no reason why it should be different, is there? You are still going to pay dividends to private shareholders?—Yes, but the workers would really see from the inside how those dividends were made. I think a great deal of the separation that there is between employers and workmen is through misunderstanding. If they came together and worked the thing together, and I am not asserting that all the people appointed by the State are to be workers, but if some consumers and some people connected with the actual operation of the mines, some people that have capital in the mines, all

worked the thing together, I think there would be a reasonable chance they would all understand each other's points of view very much better.

11,487. Consider the position. Half of the directors are going to be appointed by the shareholders. The other half is to be composed of representatives of several different interests—the State, the workers, and the consumers. Is not that so under your proposal?—I do not want to limit or to assign any proportion as to how they are to be appointed. I would assume that the State would give the due and proper proportion of representation to the different interests that were not shareholders in the company.

11,488. I want to get at this. Is it an essential point of your scheme that the shareholders should have half the representation?—I should like to think of that further.

11,489. It is rather a fundamental point because, if they are to have half, any other interest must have less than half, seeing there are several other interests?—Not if you aggregate the other interests.

11,490. If it is quite legitimate to aggregate the other interests—the workers and the State, or the workers and the consumer, or the State and the consumer—they may conceivably disagree?—Conceivably, yes; but conceivably when you get different interests together you have all sorts of combinations amongst them.

11,491. My point is quite a practical one. On one side there is a solid block of the representatives of private shareholders. On the other side there is the representatives of several different interests. If you want your scheme really to offer satisfactory evidence as to the value of State initiative, that is not the way the authority ought to be constituted. It would be much better to go the whole hog in this experiment and let these particular experiments be an experiment in nationalisation or State ownership; then it would prove or disprove something?—It is a matter of opinion.

11,492. You see the difficulty?—I must say I prefer my own scheme.

11,493. *Mr. Robert Smillie*: A question was put to you whether you knew of any demand for nationalisation of the mines outside the Miners' Federation. Did you say you did not know of any demand?—I am afraid I forget how I answered that.

11,494. I think you said there was a remote demand. Are you aware the British Trade Union Congress, representing all the organised workers of Great Britain, have repeatedly passed resolutions at their Congress calling for the nationalisation of mines?—That was in my mind; it escaped my memory in answering.

11,495. It is important if it went from here that only the miners were asking for it. Would you be surprised to know there is hardly a single trade union in the country that has not passed resolutions asking for nationalisation of the mines?—As far as I recollect, that is true.

11,496. Do you know whether or not the parliamentary union, that is to say, the Labour Party, have branches in practically every town and city in Great Britain and have passed resolutions for the nationalisation of the mines?—I think that is so.

11,497. If that is true, it is not a small part of the community making this demand?—I do not think I said it was.

11,498. It was put to you by Sir Allan Smith it was the miners only, a limited number of the community. I put it to you that the vast majority of the working classes, at least the industrial class in the community, are desirous of having the mines nationalised?—Certainly my information is, of course, it is published at the proceedings of the Trade Union Congress, that there have been a great number of resolutions passed.

11,499. Do you know there are a number of professors of universities in this country who are in favour of nationalisation of mines?—I daresay there are some.

11,500. Do you know there are a large number of the educated classes and the wealthy classes who are in favour of nationalisation of mines and have expressed themselves so?—No doubt, some.

25 April, 1919.]

PROFESSOR WILLIAM ROBERT SCOTT.

[Continued.]

- 11,501. You are at Glasgow University?—Yes.
- 11,502. How far does your knowledge of Glasgow carry you back?—Only four years.
- 11,503. That is from practical experience of it?—[I am quite a new-comer in Glasgow.]
- 11,504. Have you taken the trouble to read up any municipal history?—I knew that before I went to Glasgow.
- 11,505. I suppose it has gone in for municipalisation on a scale that very few cities have. Do you know anything at all about the fight that took place as to whether or not Glasgow would municipalise its tramways, I mean from reading the history of it?—Personally, I cannot recollect it. I was a young man at the time.
- 11,506. Do you know whether every argument that has been used against the nationalisation of mines was used against the municipalisation of the Glasgow trams? Were you aware of that?—I cannot recall the arguments used then, at the moment.
- 11,507. Would you think there would have been arguments used by interested persons against the municipalisation of the Glasgow trams?—Quite probably.
- 11,508. Has the municipalisation of Glasgow trams been a success. Have they a successful municipal tram service in Glasgow?—I think it is successful on the whole.
- 11,509. Is it true the fares are less than half per mile than what they were under private ownership?—Probably they are.
- 11,510. Do not you know as a matter of fact you are riding on Glasgow trams for less than half-penny a mile?—I know the present fares and I have a general recollection of what the old fares were, but I do not know the distances.
- 11,511. Will you make enquiries when you go back. You will find that I have under-estimated it considerably?—I think you are right.
- 11,512. Do you know that districts of Glasgow have been opened up and tram lines laid down where private companies never attempted to do it?—Yes.
- 11,513. Will you find out for your own information whether the newspapers of Glasgow were not for months and months flooded with letters condemning any idea of municipalisation. Is it not a fact they have made a profit of over £60,000 a year for the Corporation from those trams which are charging half the fares the private owners did?—They have made a large profit until recently; I cannot give you the figure.
- 11,514. Do not you know it is at least £60,000 a year?—It is very difficult to remember. I would not like to pledge myself to any figure.
- 11,515. Do you think it would have been a wise thing when the Glasgow Corporation was considering the question of municipalising its trams that they should halve the responsibility, take over half of the private owners' interest and let the private owners keep the other half. That is what you propose in the coal trade?—Yes.
- 11,516. Instead of nationalisation you propose the Government should buy out half of the interests and have the right to appoint half of the Directors. Do you think the Glasgow Corporation, a body of business men, would have been taking a wise step to have bought half the interests of the then private tram Company and appointed half the Directors?—The cases are very different.
- 11,517. They are only different in extent. Is not the principle the same?—The extent to my mind is very important in this case because the Glasgow tram service like other tram services was localised and in complete nationalisation you are jumping from the management of a firm of moderate size—I think the largest has a capital of about £5,000,000—up to something that might be 20, 30 or 50 times the size and all combinations that hitherto have succeeded have been extended by steps and not by jumps.
- 11,518. Unification would be the same if in private hands; would it not be the same; it is large to manage?—I do not suggest unification in private hands.
- 11,519. I put it unification of the industry would be as large a thing as State ownership of it if it were to be unified under the trust of the employers. You do not propose that?—I should not like to see that unless it were very strictly State controlled.
- 11,520. You propose that you should limit the units of your scheme to counties. I think you suggested county areas?—What I really suggested was either a coal-field or something that was a separable area that was self-complete as regards coal measures.
- 11,521. What do you mean exactly by a coal-field?—One where you have coal measures occurring together.
- 11,522. Take the Lanarkshire one?—Yes.
- 11,523. Might you not have it in this way that one of your coal-fields might be so poor as to make it impossible to pay the same wages as could be paid in another coal-field where the coal was better and more easily got and a greater demand for it?—In my proof I suggest there ought to be, as far as possible, an average one, not a best or worst, but something in between.
- 11,524. You must take it as it is there. You cannot improve the quality of coal nor thicken the seam. I want to say to you now that one of the main reasons for asking for nationalisation is that the tendency is for wages to be based on the worst situated mine or else it must go out of action. It is based upon that. That is one of the main reasons why we are asking that mines should be nationalised. Would not that occur under your system, too?—A Board of this joint company that I propose would settle wages on whatever basis they liked.
- 11,525. Could they?—Yes, I should think so.
- 11,526. Could they not only settle wages on whatever position they found themselves in? I put to you now, you would have the same danger in your proposal as we have at the present time of the wages of miners being fixed on the worst condition of mines or the mine going out and shutting down. That has taken place in the past. Mines have shut down because they could not pay. I put to you the same danger would be faced with your scheme?—I am afraid I cannot see it.
- 11,527. You say you would try that as an experiment to see if that was a success. What do you mean by a success? Do you mean a financial success?—Partly; partly in harmonious working inside the industry; partly in general improved conditions.
- 11,528. It might be a success, might it not, supposing it did not pay as large dividends as had been paid to private owners if it improved the living conditions of the persons who worked in it?—Yes.
- 11,529. Would not that be one of the things to make it a success?—Yes, provided it was able to pay interest upon its capital—provided it was able, in other words, to maintain itself.
- 11,530. The Corporation of Glasgow has not only its tramcars; it has its gas supply, its electricity and its water municipalised. Are those services, the tram service, the water service, the electricity supply and the gas supply not models of how industry should be carried on?—They are quite good. I should not say they are all models in every respect.
- 11,531. Do you know of anything better in the hands of private owners?—There is nothing you can precisely compare Glasgow with because there are no private concerns carrying on those services that have an area as big as Glasgow to supply.
- 11,532. Are you aware of the fact that the price of gas in 90 per cent. of the cases is cheaper where it is municipalised than where it is under private companies?—It is some time since I have been through the figures. I was through them a little time ago.
- 11,533. Whether the town was large or small; Hamilton is a small town and Glasgow is a large town in both cases the gas is municipalised and in both cases it is considerably cheaper than by private enterprise. Are you aware of that?—You must compare Glasgow with a place similarly situated with regard to coal-fields and similar conditions.
- 11,534. Remember you are answering this as a citizen of Glasgow. Would you prefer to go back to private owned trams, to private owned water

25 April, 1913.]

PROFESSOR WILLIAM ROBERT SCOTT.

[Continued.]

supply, to private owned gas and to private owned electricity. Could you, on behalf of the people of Glasgow, say they want to go back to the old thing. Is it possible to give an answer to that question?—No, I do not think I could.

11,535. *Mr. J. T. Forgie*: Is it the case that when the tramways were run by private enterprise they were run by horses?—I cannot recollect.

11,536. That is so. During the whole time the private enterprise ran the tramways in Glasgow they were run by horses. Is it the case that that company which owned the tramways in Glasgow had only a lease for 21 years from the Corporation of Glasgow to use the streets?—It had a lease; I cannot recollect the length of it.

11,537. Therefore there was no great temptation for them to do much during that short lease, to spend money in increasing the service?—They got it very cheaply.

11,538. Who got it very cheaply?—The Corporation from the company.

11,539. There was no great temptation for that private company to spend money in developing the tramway service with that very short lease of 21 years?—That is so.

11,540. At the same time, the company had to pay a very large rental to the Corporation of Glasgow for the use of its streets?—It had to pay a rental, I recollect.

11,541. The Corporation of Glasgow, or rather the Tramways Department of the Corporation of Glasgow pays nothing from the Tramways Department to the Financial Department. There is no charge for the use of the roads or streets, therefore that £60,000 does not represent the profit made as against the profit or loss made by the private Tramway Company?—That is so.

11,542. Glasgow having an assured long period to run those tramways have seen it fit to develop their

tramways without any difficulty about their period expiring very shortly?—Yes. They are able to effect improvements which the benefit of which would be exhausted within the period of a very short lease.

11,543. The introduction of electricity as a means of propelling those tramways has brought about a great reduction in the cost of running those tramcars and necessarily so?—That is so, and it affects both private and public ownership.

11,544. A new private company would have been able to reap the advantage of this modern improvement as well as the Corporation of Glasgow?—They would have reaped an advantage.

11,545. Is it fair to say the fares under the old tramway company in Glasgow were high compared with the present fares?—The two things are not comparable.

11,546. *Mr. Robert Smillie*: Are you aware the hours of the guards and drivers is 8 hours per day as against 12 when privately owned?—I am aware the hours have been reduced.

11,547. Are you aware that even before the war the wages paid to the drivers and conductors were 70 per cent. higher than were paid under the private ownership?—I think one ought to add to that that the wages of tramway drivers and conductors on an electrical service are higher than to men on a horse service.

11,548. Are you aware that Glasgow wages with horses are higher and the hours shorter than any privately owned tramway in the country?—I know that; the things are very different.

11,549. People have to live in the country as well as in the towns?—Compare the size of the undertakings. You are comparing an enormous system in Glasgow with a thing in a little country town. I do not think it is a fair comparison.

(The Witness withdrew.)

Mr. Frank Hodges: Could the Secretary get out a statement showing the number of shifts lost in the industry through strikes for the four years prior to the war and the four years of the war so that we can get an exact index of the state of industrial unrest during that period?

Chairman: Will you kindly put down what it is you want and hand it to the Secretary.

Mr. Robert Smillie: Might I ask at this stage whether you will give instructions for some witnesses to be called. The Act gives you power to call witnesses. I want to call the Marquis of Bute, the Earl of Dunraven, the Duke of Hamilton, Lord Durham,

the Duke of Northumberland, Lord Londonderry, and a representative of the Ecclesiastical Commissioners and Lord Dynevor. I should like to give those gentlemen an opportunity of saying something.

Chairman: What day shall we take all these gentlemen? I want to cause as little inconvenience to everybody as possible. We are taking the case of the mining royalties on Wednesday. The Secretary will send out subpoenas to those gentlemen for Tuesday week.

Mr. Leslie Scott: I will ask leave, if I may, to make an application on Tuesday morning.

Chairman: Send in a notice to me, Mr. Leslie Scott.

Mr. JOHN ATKINSON HOBSON, Affirmed and Examined.

Chairman: It is not that I wish to hurry over the witness, but possibly if we restrict the output of cross-examination we shall get this witness finished to-day. The *précis* of the evidence of Mr. John Atkinson Hobson, Master of Arts, and author of economical works is as follows:—

“Assuming that unification of the coalmining industry is recognised to be desirable, the alternatives are full nationalisation, in the sense of State ownership and operation; or joint control either under private or State ownership. For unification under private ownership and control may be ruled out, as offering no adequate guarantees for the supply of sufficiently large and reliable output and sale at reasonable prices. The private monopoly of a necessary of life and of industry places a dangerous power of extortion and oppression in the hands of the monopolists.

The mining industry does not appear to be a good subject for joint control. For if, as must happen under such an arrangement, the detailed management of the industry is left to the mining companies, it will be very difficult to prevent that management being directed by the motive of private immediate gain as

heretofore, instead of by the new motives of public service, in the relations of the industry to the consuming public and to labour. So long as the same managers are left to do the same work, it will be almost impossible to get either into their minds, or into the minds of the workers, the new intentions designed to secure harmony of relations between workers and administration, and efficient output. Any attempt on the part of the Government to exercise close control would breed incessant friction with the companies, while lax control would leave the companies with too much power over output and labour conditions.

The case for full nationalisation, thus indicated, is supported by wider considerations. The naturalisation of railways is practically a certainty of the near future, and their early electrification is probable. In any event, a great scheme of generation and distribution of electrical energy for important public services, public and private industries and domestic uses, is likely to be carried into effect. Coal will be the source of this energy, and the safety and success of all these public and private enterprises

25 April, 1919.]

MR. JOHN ATKINSON HOBSON.

[Continued.]

will be contingent upon an adequate, reliable and moderately priced supply of coal. Though every coalfield, every mine and seam, has its own peculiarities, coal, as a commodity, is capable of standardisation and distribution on a large routine basis. The nationalisation of railways, and of public services dependent on fuel, is insecure so long as any effective control of coal mining remains in the hands of private companies. No scheme of sliding scales for the adjustment of profits to selling prices is likely to prove satisfactory in an industry when the relation between costs of production and output are so variable. The contention that individual initiative and enterprise would be impaired by nationalisation has little weight in light of the evidence produced before the Commission exhibiting the backwardness of private management to avail itself of recent technical and business improvements.

It is evident that any scheme of joint control implies an exceedingly imperfect unification, *i.e.*, a proportionate failure to secure the full economies of a national service, either in the production or the distribution of the coal. As for a tripartite co-partnership of capital, labour and the public, experience in other cases does not suggest the feasibility of a satisfactory balance of interests. Moreover, and this I regard as an exceedingly important consideration, the new mind of the workers in this country, and especially of the miners, is definitely set on nationalisation. The dislike to work for the companies is not wholly due to a feeling that their labour has been exploited for high profits during the war. There appears to be a wide-felt preference for a new status as employees in a public service. This feeling for status must be taken into account, for if it is real, it signifies that a more reliable supply of coal can be got under a nationalised than under a private industry. The opponents of nationalisation may say that this implies a desire of the miners to plant their constantly growing claims upon the assumedly unlimited purse of the taxpayer. But, so far as this objection seems to carry weight, it applies with almost equal force to any plausible scheme of joint control, as war experience sufficiently attests. This risk, if it be real, applies to all national services. But, in point of fact, public employees in general have not been willing or able to abuse their position by bringing political pressure to bear. If it be alleged that miners, or railwaymen, will, by reason of their numbers and organisation, be able to do so, the answer is (1) that they will be less likely to press excessive or unreasonably large demands upon the public than upon private "profiteers," (2) that the greater publicity of mining conditions which should attend nationalisation would be likely to educate a strong public opinion hostile to a privileged position for miners at the expense of the consumer or the taxpayer, (3) that the growing education of the working classes and their increasing consolidation for industrial and political objects will furnish such checks upon the tendency of any single group of workers to advance far faster than their fellows, and even to injure these fellows as wage-earners, consumers or taxpayers, by excessive demands pressed unduly at their expense.

In conclusion, I desire to put in a strong protest against the proposal to provide for miners a special housing fund by placing a charge of a penny per ton on all coal. This is a particularly bad form of indirect taxation, bad in its incidence upon the poorer classes of consumers, so far as they pay it, bad in its shifting if it is shifted. It is particularly wrong in the case of coal mining, because that industry yields a surplus peculiarly fitted to bear such a charge, *viz.*, royalties."

11,550. *Mr. Cooper*: Do you occupy any Professorial Chair?—No.

11,551. Might I ask what is your precise occupation?—I have been a student of economic subjects; formerly a University of Oxford Extension lecturer on political economy, and in recent years a too voluminous writer of books upon economic subjects.

11,552. May I take it that your actual occupation is that simply of authorship?—Yes.

11,553. What particular opportunities have you had of gaining knowledge about the condition of coal mining?—None.

11,554. I observe about half-way down your statement you say that "the evidence produced before the Commission exhibiting the backwardness of private management to avail itself of recent technical and business improvements." Have you read the Shorthand Notes of the proceedings before the Commission?—I have not read the Shorthand Notes. I have read as much as I could of the reports in the papers.

11,555. Is that statement based entirely on newspaper reports?—Yes, so far as the Commission goes. I have not had time, or opportunity if I had the time, to read the Shorthand Notes.

11,556. When were you asked to give evidence here?—About a week ago, I think.

11,557. Who asked you to give evidence?—I received the usual intimation from the Secretary of the Coal Commission.

11,558. Did it not occur to you, before you made such a statement as that, that you should have read the Shorthand Notes of the evidence for yourself?—It would have been practically impossible for me to have given the time during the brief interval to have read the whole of the Shorthand Notes of the Commission.

11,559. I do not mean reading the notes of the evidence that are irrelevant to the question. I mean, for example, the notes of the evidence that were relevant to the question?—In order to find that evidence I should have had practically to go through the whole of the reports.

11,560. You think you were justified in coming here and making a statement like that based upon newspaper reports?—Well—

11,561. Answer my question, please, yes or no?—Yes.

11,562. I ask you no more questions.

11,563. *Mr. Evan Williams*: When you speak of joint control in your proof, I assume you mean joint control where the State intervenes in the industry. "The opponents of nationalisation may say that this implies a desire of the miners to plant their constantly growing claims upon the assumedly unlimited purse of the taxpayer"?—The opponents of nationalisation may adduce that.

11,564. You say that has been the case?—I do not say so, and I do not say so here.

11,565. "But so far as this object seems to carry weight it applies with almost equal force to any plausible scheme of joint control, as war experience sufficiently attests"?—"But so far as this objection seems to carry weight it applies with almost equal force." So far as it has any weight it does apply.

11,566. So the effect of State interference, so far as it has gone in the direction of joint control, has been to impose burdens upon the taxpayer?—No, I think there is a natural desire on the part of the workers, whether under private or public industry, to improve their general condition. So far as the thing is already under public control, or where the public purse is called upon to pay, the increase of wages has still gone on, or the demand has.

11,567. The interference of the State or the tendency of an interest by the State wholly or partially is not likely, in your view, to affect the demand made by the workman in that industry upon the owners?—I think the sense of the workman in an industry that no profiteering, as they call it, is made by the capitalist will be and is to some extent a check as to the amount of demand which they are likely to press. They would prefer on the whole, without being ideal citizens, that the State or the municipality should get the advantage of whatever surplus accrues on industry than it should go to the owners of the private capital. To that extent they would be less likely to press unduly and dangerously their claims upon a public authority.

11,568. Are you aware the miners have stated it is quite immaterial to them who gets the profits, whether

25 April, 1919.]

MR. JOHN ATKINSON HOBSON.

[Continued.]

the State or the owner, as long as the profit is made from the industry they are entitled to have their wages raised?—The miners; what miners?

11,569. The Miners' Federation?—I do not know that; I am surprised to hear the miners expressed any such view.

11,570. It has been expressed?

Mr. Frank Hodges: Where?

Mr. Evan Williams: By the Miners' Federation. I have heard of it. It has been made in this room, I think.

11,571. Sir Allan Smith: You start your *précis* by saying, "Assuming that unification of the coal-mining industry is recognised to be desirable." Is the whole of your *précis* built up upon that assumption?—Yes, I am afraid it is. I did assume that it would be impossible to go back to the pre-war conditions in the coal-mining as in the railway industry. There were certain industries where it was practically impossible to return to the old conditions, partly owing to the unsatisfactory character of those conditions in the year before the war, and partly to the changes that have taken place during the war with regard to forcing the pace of unification.

11,572. Tell me very shortly what are the unsatisfactory conditions to which you have referred?—The fact that the public who would have no security of having a regular sufficient supply of coal at its disposal.

11,573. There was that experience prior to the war?—Yes. I think there was a growing sense of insecurity in the public as regards the supply of coal owing to the quarrels between the two parties in the private industry.

11,574. Do you suggest that you should remove that control from one of the parties and leave the control in the hands of the other party?—I do not suggest that.

11,575. What do you suggest?—The unification of the coal-fields.

11,576. Does that involve the carrying on of the coal-fields by a Government Department?—Yes.

11,577. In consultation with the miners?—In consultation with all persons having interests affecting the good working of the industry.

11,578. Who are those persons?—The persons would be the coal miners and the consumers, assuming that the State were the owners of the third factor of production, namely, capital.

11,579. Are you satisfied that that would be a good economical and useful combine for the purpose of working the coal fields?—I think it would be better than returning to the dangerous conditions.

11,580. Answer the question. Would that be a good combination for the working of the coal fields?—It would be a better combination.

11,581. A good combination?—Good is a relative term.

11,582. "Better" is more of a relative term?—I do think so.

11,583. Do you include the distribution of the coal in the same scheme?—Yes.

11,584. You would eliminate all the people at present engaged in coal distribution?—For profit.

11,585. Would you compensate the people?—Certainly.

11,586. Out of what?—Out of the public fund which acquired these rights.

11,587. Sir L. Chiozza Money: It was suggested to you that you ought to have read the evidence before you came here. Are you aware it would not have been possible to do so because copies are not available?—I was not aware of that.

11,588. It was rather beside the point to suggest you ought to get copies, as I cannot myself get a complete corrected copy. Did you notice in the papers in some of the excellent reports that it was shown in evidence that in certainly one big mining district the technical efficiency of the mines was not all that might be desired?—I saw that statement. I assumed that would be granted by everybody with regard to a certain portion of the mines in the coal fields.

11,589. Did you notice that an Inspector of one of the big mining districts said he estimated not more than one-third of the mines in his district could be said to be thoroughly up to date and well equipped?—I remember something of that kind being said.

11,590. It was suggested to you you know nothing about coal mining and you were asked who brought you here. Are you aware Mr. Harold Cox, who was brought here by the other side, confessed he knew nothing about coal mining?—So I understand.

Sir Allan Smith: Might I interrupt on a point of order to refer to the remark which Sir Leo has made. He said that Mr. Harold Cox was brought here by the other side. Who is the other side? I think it is an unfortunate remark.

The Chairman: That is a misapprehension of Sir Leo's. As a matter of fact, to make it quite clear, Mr. Harold Cox came here at my suggestion. I am certainly not on the other side. I thought it right to have everybody, no matter what side, whom I thought could give evidence. I know Mr. Harold Cox held certain views, and I said he certainly ought to be called. I think somebody gave me this gentleman's name as holding an opposite view. I said "let him come too". There is a misapprehension in saying "the other side".

Sir L. Chiozza Money: I am glad Sir Allan asked the question. I was under a misapprehension. You are aware that no objection was raised by Mr. Cooper to Mr. Harold Cox's evidence on that ground.

11,591. Mr. R. H. Tawney: You have been a student, I understand, of economics all your life?—I have.

11,592. You have also sometimes contributed to the Press?—I have.

11,593. In that respect, you were similar to Mr. Harold Cox. You have also written, what I hope I do not offend you by calling, solid works on economics?—Solid and heavy.

11,594. Which have obtained a high reputation amongst those qualified to judge. Let me take you over your evidence. In the first place, I gather you think that we have really to start from the position that something new must be done; that is to say, we cannot simply now say we will leave things as they are?—I think everybody who has his eyes open at the present time agrees if we are to have a satisfactory industrial peace in this country and return to prosperity, we must have something which they call high productivity, and high productivity cannot be got without the increasing contentment of the workers in the chief industries; I have no doubt whatever; and this is one of the chief industries directly concerned.

11,595. One suggestion put forward is a combination. I understand with that you do not agree?—No.

11,596. A second suggestion put forward was, it should be a private organisation under the public control—external supervision. You appear to agree with the others who say it would breed incessant friction?—I think that is so. I do not think you could get effective control on the part of the Government with a business that was still said to be privately managed in all its details without constant friction.

11,597. The third alternative you put forward is nationalisation. As you know there are many objections advanced to that. First of all, there is the objection it would be unduly bureaucratic. What do you think about that? On the face of it it seems a reasonable objection?—It is a reasonable objection. There would be a difficulty in getting a satisfactory running of the mining industry unless we can do something which is substantially sound towards reconciling the working classes with the State, that is to say, making what I should call a more democratic State—democratic in its constitution and in its administration.

11,598. That is to say, the efficiency or inefficiency of nationalisation, like the efficiency or inefficiency of private ownership, are not matters to be settled in the abstract on this *a priori* argument which is

25 April, 1919.]

MR. JOHN ATKINSON HOBSON.

[Continued.]

unsatisfactory. It depends on the character of the State?—Yes.

11,599. That lies within human control. If one is unsuccessful another method can be tried. You refer to the question of public electricity and public railways, and you say that has some connection with the coal supply. Would you develop that?—What I mean is this. The progress of this country in its mining industry will depend more or less upon the new plan for electrification and improved transport system of the country, and both these depends for their industrial life upon a reliable supply of coal, and, therefore, the whole issue of the development of these great national industries and the security of them, as well as of the domestic supply of coal and of electricity, which will become increasingly important for ordinary domestic purposes, are things that hinge on coal, and it is for that reason that the effective social control under the State of the coal mines seems to me at the present time to be of such primary importance.

11,600. That is to say, if the State were to run the railways, for example, it might have to protect itself by owning coal mines, is that the point?—Yes. If you have a private cartel or a private company owning the coal they would be in a position to rack rent the railway system, an intolerable position.

11,601. We have heard something of the absence of stimulus of self interest under any form of self-management. You have studied economic motives. Can you tell us what you think about that?—So far as the individual worker is concerned, I cannot see why his incentive should be less if he is paid by a public employer than by a private employer, and the same, as far as I can see, ought to be true of the managers or the engineers in a coal mine. There is no reason whatever why, that is to say, as far as his own career is concerned, he should not have a private incentive under State ownership and control. It would still be to his advantage to have a higher post in the new civil service rather than a lower post; to have a better remunerated post than a lower remunerated post. These are the men whose energy of mind and body contribute mainly or almost wholly to the efficiency of the industry, and if they are still subject to what we call ordinary selfish methods, why should they not continue to operate under a State system.

11,602. *Mr. Frank Hodges:* In reply to Sir Allan Smith, you suggested that the three parties in the industry would be the State, the consumer and the miner?—Yes.

(The Witness withdrew.)

Chairman: With regard to the subpoenas you want to issue, what sort of information do you suggest we should get?

Mr. Robert Smillie: The list I have given you is only a sample of the witnesses we want called. I should like them to attend and produce their titles, to show us the extent of the holding of the private mineral rights, the output of coal and other minerals, and the total annual output from their estates. Also the amount per ton payable, whether it is fixed or on a sliding scale, and the income they receive from mineral royalties.

Mr. R. W. Cooper: I do not know whether we should discuss this question here or *in camera*. I am the last person in the world to prevent any information being laid before the Commission, but I do venture to suggest to Mr. Smillie that these gentlemen ought not to produce their title deeds. Consider what that means. I happen to know a good deal about Lord Durham and a good deal about his title deeds. If Lord Durham is asked to come here and bring all his titles, then he will have to bring a railway van. I am personally acquainted with Lord Durham's title deeds. Lord Durham will tell you everything you want to know. I do suggest the question of the production of the title deeds has no re-

levance, and is an oppressive construction of the section. It is for the Commission to decide.

11,603. It was not your intention the word "miner" should be interpreted too literally. You mean by "miner" every man engaged in the industry in a productive sense?—Yes, I did. I did not mean the narrow sense of the word. I meant everybody employed usefully in the industry.

11,604. Whether an existing managing director, if he contributed to the technical improvement of the concern, you include him as well as the miner?—Certainly.

11,605. The principal objection, apparently, to nationalisation appears, as Mr. Tawney put it, to be its implied bureaucratic administration. To take it to the extreme, is the theory that, to be free entirely from bureaucratic administration, you ought to have some such system of control as syndicalism? Have you examined the theory?—I have examined it as a theorist.

11,606. Would you say that is a form of administration that should be effective in a great industry such as the coalmining industry?—I do not think it is a form of administration that would be effective. I think the development of to-day has shifted the view of those who would have been reckoned as ordinary State Socialists a few years ago, and we recognise it is important that there should be a different representation of the workers in the industry in the administration of that industry.

11,607. In effect, the proposal you are putting before the Commission at this moment is a sort of modification of the old idea of State ownership with bureaucratic administration and some form of control out of a syndicalist idea on the part of the workman?—Yes there must be a strong representation of the interests of the workers in the governing portion of the industry.

11,608. Do you think that the workmen, putting it in a wide sense of all workmen engaged in the industry, are intellectually equipped to take an intelligent part in this great industry?—There, again, you see, I have not direct experience. I should think so, from my knowledge of the working class movement and the educational influences acting on the working classes.

11,609. Could you make a deduction as to the intellectual equipment of the working class, say, from that, from the control exercised by a committee of management in the administration of local co-operative stores?—I have no experience of that kind closely before me. I do not fear myself the lack of interest and intelligence, especially under the stimulus of the new social feeling.

Mr. Leslie Scott: As far as some of the gentlemen I appear for are concerned—

Chairman: Mr. Leslie Scott, you must put it in writing. I sent a message to you, as I saw you were leaving the room. I thought you ought to hear this application, but you must put in writing anything you have to say.

Mr. Leslie Scott: I recognise that is the ruling of the Commission. I must, with great respect, very greatly deprecate that ruling. It puts counsel in the position of great and, I think, almost unprecedented difficulty.

Chairman: I think it does.

Mr. R. W. Cooper: I hope Mr. Smillie will withdraw that part of his request.

Mr. Robert Smillie: Certainly not. Lord Durham's title is not the kind of title I want. I want the title conferred upon him when his lands were conferred on him and I want to find out who gave him the lands and the title.

Mr. R. W. Cooper: Would a memorandum made by myself do?

Chairman: The Committee will adjourn to 10.30 on Tuesday morning, and will be sitting in private. At 11.30 it will be sitting in public.

(Adjourned to Tuesday morning next at 10.30.)

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

SECOND STAGE—FOURTH DAY.

TUESDAY, 29TH APRIL, 1919.

PRESENT :

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. ROBERT SMILLIE.

MR. R. W. COOPER.

SIR ALLAN SMITH.

SIR ARTHUR DUCKHAM.

MR. HERBERT SMITH.

MR. J. T. FORGIE.

MR. R. H. TAWNEY.

MR. FRANK HODGES.

MR. SIDNEY WEBB.

SIR LEO CHIOZZA MONEY.

MR. EVAN WILLIAMS

SIR RICHARD A. S. REDMAYNE (*Assessor*).MR. ARNOLD D. MCNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

Mr. Robert Smillie: Sir, in connection with an application which I made last week, I would like to amend it to a certain extent this morning, and ask you to be kind enough to call the Duke of Hamilton's agent, the Duke of Northumberland, Lord Durham, Lord Dynevor, Lord Tredegar, Lord Dunraven, the Marquis of Bute and Captain Womyss. The purposes for which we would like them to attend are to show us the extent of the holding of the proved mineral rights, the output of coal and other minerals, the total annual output from their estates, also the amount per ton payable, whether it is fixed or on a sliding-scale, and the income they receive from mineral royalties and wayleaves, if any.

Chairman: I am obliged to Mr. Smillie for making that application. I think it is only due to him to say, and I intend to say it, that the reason he does not want the Duke of Hamilton is that it appears his Lordship is unwell. Mr. Smillie does not want to put him to any personal inconvenience in attending, and therefore Mr. Smillie has substituted the Duke's agent instead of the Duke of Hamilton. I purposely say that publicly. Those gentlemen will be written to and asked to attend or be subpoenaed, as the case may be. Now I will call Mr. Sidney Webb.

MR. SIDNEY WEBB, Sworn and Examined.

11,610. *Chairman:* I believe you are a Bachelor of Laws, Barrister-at-Law, and Professor of Public Administration in the University of London?—Yes.

11,611. Will you kindly read your proof?—Yes.

"1. Ho has studied the conditions of efficiency in administration and the methods adopted, alike in private enterprise in many industries and in the various forms of co-operative and governmental enterprise, central and local, in different parts of this country, and also in other countries, over a long period. Among other publications, he was principally responsible for the chapter in *How to Pay for the War*, entitled "The Nationalisation of the Coal Supply," which was separately issued under that title. This summarised the available information on the subject down to 1915; and the pamphlet, as republished, is put in as part of the evidence before this Commission.

The Root Cause of the relative Inefficiency of the British Coal Supply is its foundation on private profitmaking.

2. It is desirable to make plain that the relative inefficiency of the British coal supply, as already demonstrated—an inefficiency which, it is submitted, is seriously detrimental to national well-being—is not to be ascribed to personal shortcomings in those who direct the various branches of the industry. There seems no ground for accusing the mining engineers, or the directors or managers of collieries, or the mer-

chants or dealers in coal, of any technical inefficiency. Indeed, it is not suggested that there is among them, for the most part, any inefficiency in getting profits. Even those who suppose that profitmaking is indispensable as a motive, will realise that the making of private profit is no test of efficiency, nor the amount of the profit any measure of the efficiency. To the economist of to-day, as to the statesman, an efficiently directed industry of coal supply which would be one which:—

- (a) provided for all the persons engaged in the industry the essential conditions of a civilised life, full opportunity for individual development and civic efficiency, so far as was compatible with the necessary conditions;
- (b) reduced to a minimum the number and gravity of the casualties incidental to the industry, and the impairment of health by its special diseases;
- (c) produced the required amount of coal when and where it was wanted with the greatest regularity and the smallest possible efforts and sacrifices of those engaged—which (and not the amount of wages or salaries) the economist means by "cost of production";
- (d) made as economical as possible a draft on the nation's irreplaceable resources in coal.

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

It is on these four points that the present system of administration of coal-mining and coal-distributing is (here the witness adopts the weighty judgment of Sir Richard Redmayne, the experienced Chief Inspector of Mines) "extravagant and wasteful"—alike as regards human life and personal development, as regards the nation's coal, and as regards expense to the consumer. It is submitted that the cause of this waste and extravagance is the present system, or absence of system, which makes the management of coal-mining, the marketing of the coal, and its retail distribution, the sport of individual enterprise and competition for profit, without union of aim or co-ordination of effort, each of the jostling rivals seeking, and being tested by, not public service but merely private gain. Whatever advantages this chaos of private interests may have—perhaps in stimulating the wits of the capitalist competitors and lessening their indolence—its drawbacks in the coal supply have been made sufficiently manifest to have led the Government, in explicitly accepting the Chairman's Interim Report of 20 March, to commit itself unequivocally to the policy of a national unification of the colliery enterprises. This being the case, the witness submits that only national ownership can meet the necessities of the position. Nationalisation is called for (1) as the only means of adequately improving the position of the miners with regard to housing, accidents and special disease and infantile mortality; (2) as the only means of dealing economically and efficiently with the nation's coal resources; and (3) as the only means of ensuring that the coal is supplied to the consumers with regularity and at the lowest cost.

(a) *Housing.*

The housing conditions of the mining population, which constitute a grave national peril, can only be effectively dealt with by a public authority of national scope. No business considerations will ever warrant each colliery enterprise in erecting decent cottages near each pit, many of which may be expected to be worked out within a short term. The same reasons apply to prevent any prudent Rural or Urban District Council from taking action on any considerable scale—even if it were to the pecuniary interest of the locally influential colliery enterprise to encourage any such outlay of the rates. Nor is it fair to throw the whole cost of housing of such a special population on the ratepayers. Like extraordinary traffic on the roads, it is a case for the industry bearing its own burden. What is wanted is a prompt expenditure of something like ten or twelve million sterling; the planning of a whole series of well-designed new villages, placed in situations easy of access to the whole of each part of the coalfield; and built at the cost of a National Housing Fund provided by the mining industry as a whole. It would plainly be impracticable to arrange for such a subsidy whilst leaving private colliery owners, whether separately or united in any capitalist trust, to reap the pecuniary profits.

Such a Miners' Housing Fund, moreover, must not be provided, any more than any other national purpose should be paid for, by a tax on coal, even of only a penny per ton. Such a tax, and such a method of raising the funds, must be condemned as unscientific and contrary to sound canons of taxation. By raising the price of coal, it would make the poor man contribute almost as much per annum as the rich; and it would also by so much tend to diminish our export trade. A better method, it is suggested, would be to charge the Miners' National Housing Fund on the Mining Royalties, when these are for other reasons made national property. If the royalty-owners are compensated by being paid the present selling value of their incomes (say ten years' purchase), the interest and sinking fund payable by the Government on the capital required (say 6 per cent.) would leave an annual fund of a couple of millions, which might be allocated to housing, without causing any increase in the price of coal. But any such dealing with the housing problem, especially if the factors of infantile mortality and the lack of amenity of the mining

village are also to be corrected, is dependent on Nationalisation.

(b) *Accidents and Special Diseases.*

It is not usually realised that, as has been said, the miner is always "in the trenches." Last week, even without any big explosion, there will have been over 3,000 serious casualties in the mines of Great Britain: this is the average number officially reported each week as serious enough to involve absence from work for at least seven days (some five and twenty being fatal). Public attention is fixed on explosions of firedamp or coaldust, sometimes killing men by scores or hundreds; but these are the least of the dangers. Far more serious are the falls of side or roof, occurring to somebody's grave hurt at the rate of nearly 200 every day in the year, and accounting for 600 deaths and 62,000 serious injuries annually. Shaft accidents take place two a day, killing a couple of men daily, and gravely injuring several others.

In addition, more than 25,000 men and boys are maimed or crushed, annually (and over 200 killed), by being run over underground by trams or tubs, and over 75,000 more suffer injuries incapacitating them for over seven days (some 200 being killed) by accidents classed only as "miscellaneous." We are, in the case of the miners, "coining their blood for drachmas." The liability to accident in the different coalfields varies considerably—partly no doubt, by reason of differences in the character of the coal and the adjacent strata, but partly also, it cannot be disputed, by reason of differences in methods of working in the extent to which mechanical safeguards are provided, in the precautions taken, and in the vigilance of the inspection. The South Wales coalfield has by far the worst record, not only for accidents from explosions and those from falls of side or roof, for which there may be some excuse in the character of the strata, but also for those from being run over by trams or tubs, a fact which demands explanation: the Yorkshire coalfield disputes the bad eminence of South Wales in the number of accidents from falls of side or roof; the Scottish coalfields vie with that of Yorkshire in being the worst for shaft accidents; whilst the Northern coalfield, which (perhaps for geological reasons) suffers least from falls of roof, comes out best at all points. Places of greater risk ought to be places of great precaution. If all the coalfields of the kingdom could be made only as safe as those of Northumberland and Durham, the nation would save annually three or four hundred miners from death, and probably thirty to forty thousand from serious injury.

It is not contended that all accidents can be avoided; but it is a grave fact that, under private ownership, the pecuniary interest of the colliery shareholders is permanently against the adoption, in their entirety, of the safeguards that the Home Office recommends; and the very fact that the coalowners naturally resist such improvements—are, in fact, slow to believe that such costly changes can constitute improvements—inevitably causes the Home Office to be reluctant to recommend all that it would wish to do. It will not be denied that the 3,300 collieries differ much among themselves in the extent of their mechanical safeguards against accidents; *meaning that the worst are, in the conditions of safety, far below the level of the best.*

Moreover, with colliery agents, pit managers and deputies or overlookers keenly aware that the working expenses must be kept down, it is impossible to secure sufficient thought or care, and sufficient expenditure on the stricter supervision and more adequate precautions that would, so the miners believe, prevent a large proportion of the casualties. The enormous number of accidents caused by insufficient use of pit props to prevent falls of side or roof is very significant. Pit props are now expensive. Such mechanical appliances as automatic contrivances to prevent overwinding, detaching hooks and cage gates are still not universal, because the smaller colliery concerns and the poorer owners shrink from the capital cost involved. In some cases it would mean,

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

to the shareholders, all the difference between profit and loss. The legally required clear spaces and refuge holes (for escape from being run over by trams or tubs) are still sufficient neither in number nor in width. There is still, in many collieries, nothing that can be called a systematic treatment of the coal-dust now recognised as a serious cause of explosions; such systematic treatment is, indeed, not always an easy matter, but there is still too great a shrinking from incurring an expense which would make for safety. The trams, too small for security, are in some districts habitually piled up with coal one foot or even two feet above the level of the top of the tram, which then scatters pieces and dust. A whole generation of financial experience of the Employers' Liability Act—a couple of decades of the Workmen's Compensation Act—have demonstrated a fact of momentous significance, namely, that it usually costs less to compensate for accidents than to prevent them. This applies equally to a capitalist trust and to separate ownership.

It is submitted that it is not easy to avoid the inference that a certain proportion of the 3,000 accidents per week are, in these ways, directly attributable to dominance of the profit-making motive, involved in the private ownership of the collieries, and that this proportion, at least, will not be avoided until the private ownership, however much it is unified, has been got rid of. The miners have at least some ground for their firm belief that a nationalised administration would (a) make general at all mines all the mechanical safeguards already in use at the best of them; (b) render easier the adoption of new safeguards and precautions; and (c) diminish risks by lessening the strength of the plea that accidents cost less than prevention.

A similar inference may be drawn from the slowness that the Home Office and the colliery managers still show in adopting the preventive measures against miners' diseases which science teaches. The fear of increased expense to the owners, and of the political resistance which that fear causes, at present paralyses the authority responsible for the miner's health. It stops even educational work. The Mines Department of the Home Office does next to nothing in the way of a propagandist campaign, for instance, as to the means of preventing Miners' Nystagmus; and is afraid to prescribe what the medical experts recommend as the remedy. It is scarcely an exaggeration to say that, at present, the rate of compulsory (and therefore universal) adoption of improvements affecting the health and safety of the million miners is kept down to the rate of persuasion or conversion, not, perhaps, of the slowest and poorest colliery management, but of the most backward quarter of the whole. With an adequately endowed and continuously working Research Department forming part of the Ministry of Mines in which the prevention of accidents and diseases would be a principal object; and dealing with local mine managements that would, under the new conditions of incidence of cost, and of accounting, and the continuous comparison of pit with pit, and district with district, vie with one another in demanding the newest improvements, instead of resisting them, the miners may very reasonably expect a steady diminution of casualties and disease. It is impossible to exaggerate the national importance of this.

Infant Mortality.

4. It is not a small matter for the nation that the miners, as a whole—one-tenth of the entire community—have the highest infantile mortality of any section, namely, 160 per 1,000 births—as compared with only 96.9 for agricultural labourers as a whole, and with 76.4 for the upper and middle classes (Report of Registrar-General for 1911, Table xxviii, p. xli). Why do twice as many babies die in a miner's cottage as in a middle-class home? That it is not poverty nor mere overcrowding in insanitary hovels, nor yet any exceptional ignorance of the girls who marry miners, which is the cause, is shown by the fact that the agricultural labourer's babies, even with the wages of 1911, die at only two-thirds the rate. The gravity of the evil is, of course, not merely or mainly that so many babies

die. The causes that kill so large a proportion, inevitably damage those who survive. It is not the infantile death-rate, but the damage-rate among this one-tenth of all the nation's children that the excessive death-rate infallibly indicates, which is of the greatest moment.

It is submitted that the outstanding cause of the difference between the whole class of miners and the whole class of agricultural labourers in all the counties of England and Wales is to be found in the special conditions of the miner's home—the dirt that he and his sons bring in every day; the discomforts of his washing all over in the one room available for the family; the hanging up to dry of the wet and grimy pit clothes; the exceptionally hard work imposed on the miner's wife, not lessened by the habit of more than the average number of children.

Of course, this is no concern of the colliery shareholders and directors under the present system of private ownership and management for pecuniary profit. It would be equally outside the ken of a capitalist trust. Only a Ministry of Mines, responsible to the nation for genuinely efficient administration from a national standpoint, could take into account the effect that the industry was having on so large a proportion of the nation's children. Once those officially responsible came to consider the matter with the reports of the Research Department, and the discoveries of the experts, together with the national mandate for reform, probably various things would happen. There might be, on this ground alone, a universal installation of pithead baths, which the Home Office actually proposed to Parliament in its Bill of 1911, and provision of pit clothing, to be changed before going home. There might be some arrangement by which different shifts were made up entirely of men dwelling in different cottages, so as to avoid upsetting the household hours. It might be found that the most effective way of saving the lives of thirty or forty thousand miners' babies a year was to lay on hot water from a central station to every miner's cottage, and introduce other labour-saving devices, to counteract the extra burden that the miners' occupation imposes on the mother of his children. But no privately-owned industry would or could do these things.

Economy of the Nation's Resources in Coal.

5. There is, under a system of private ownership, whether of individual collieries or in a capitalist trust, not only no motive for an economical use of the nation's coal resources, but also none of the necessary knowledge of the problem as a whole. The Coal Conservation Committee's Reports show how wastefully we are at present dissipating our stock by—to name only the most conspicuous examples—(a) leaving unnecessary boundary ribs, made requisite only by separate ownership; (b) letting whole districts be flooded; (c) neglecting to use the small coal. No mere merging of individual colliery interests in a trust—no mere bureaucratic control of such a trust—can remedy this capital instance of the inefficiency of the industry. It is only the community as a whole that can have any motive for an economical using-up of the community's future resources. Any enterprise carried on for private profit must necessarily prefer methods of working that produce the highest contemporary dividends, irrespective of the result to subsequent generations. A huge capitalist trust would have even greater powers of resistance to, and greater means of evasion of, any attempts by the Home Office to prescribe, in the public interest, methods of working that were immediately less remunerative, than those which the existing 1,500 Colliery concerns adopt.

Nationalisation.

6. The system of letting our coal be got by 1,500 separate colliery concerns; working their 3,000 mines without co-ordination, without acquaintance with each other's cost accounts, without common knowledge as to the total amount of coal being raised or of the amount likely to be required; sinking new shafts, and working additional seams without concert or

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

consideration of the needs of the nation as a whole; on the one hand, competing with each other for their stores and new equipment as well as for their leases of coal, and on the other, competing with each other in their sales, either at home or for export; and, what is, perhaps, most important of all, deprived by their ignorance of each other's experience and results of all the check and all the emulation that close comparison of detailed working costs would promote, can hardly be elaimed, in the light of up-to-date business methods, as efficient or economical. Such an anarchic chaos necessarily results, over a term of years, in the price of coal being kept up to what will pay the worst-situated, worst-equipped and worst-managed mine that is required to maintain the output. Similarly, it results in the miner's wages being kept down to what this marginal mine can afford at such a price. The whole advantage of all the better mines necessarily goes in additional profit or royalty rent, over and above that required for the conduct of the industry, to the fortunate owners of these superior mines. This constitutes, so the economist must say, a wholly unnecessary tribute on the community, for which no good purpose can be shown. For this annual waste the witness knows no excuse.

It is submitted that there is no practicable remedy except national ownership. To merge all the 1,500 colliery concerns in a gigantic Capitalist Trust might be the means, if the Trust were sufficiently large-minded and efficient, of remedying such of the waste and inefficiency as results from disunity. But (a) it would not change the profit-making motive and thus not solve the housing problem or that of the excessive infantile mortality; (b) it would still be cheaper for the Trust to compensate for accidents than to prevent them; (c) a Capitalist Trust would have no more regard than the separate colliery owners for the most economical use of the nation's irreplaceable stores of coal; (d) it would still be up against the causes of waste and inefficiency incident (as Sir Richard Redmayne has demonstrated) to the present individual ownership of royalties.

What is even more important, to form a gigantic Coal Trust would be to commit both the industrial and the domestic consumer to the tender mercies of a monopolist who would have no other interest than to charge the utmost price that "the traffic would bear"; and to produce, not all the coal that could advantageously for the nation be consumed, with the regularity that would be most convenient, but such an amount only as would produce the greatest net income, even with any stoppages or irregularities that could be made the means of additional extortion. Witness believes that any proposal for a Capitalist Trust in coal, however camouflaged, would meet with the most strenuous opposition, not only from the Miners' Federation and the whole Labour Party, but also from the powerful Co-operative Movement, now beginning to have its own collieries, which would certainly refuse to enter such a combination; from industrial users of coal; and from the ten million domestic consumers. Such a proposal would be so univorsally unpopular as to bring down the strongest Government.

It may be urged that such a capitalist trust could be put under control; that a schedule of minimum wages and maximum hours could be imposed on it, together with a fixed maximum price. Experience shows that all such safeguards of capitalist monopoly are delusive. There are always a hundred and one ways in which they can be dodged; and no one would willingly put faith in the ability of a Government Department to outwit the profiteer. A single monopolist concern, having its tentacles in every constituency in the Kingdom, with a million families on its pay-roll, would be far too powerful a Leviathan to be dragged with a hook by the Home Office. From the standpoint of the consumer, such a monopoly would be scarcely less open to objection if it were, in an unholy profit-making alliance, the joint concern of the combined capitalists and the Miners' Federation. Finally, it must be pointed out that a Government which was administering a national system of railway and other transport, and also a national system of electricity generation, could hardly allow itself to be

dependent, for the regularity of its indispensable coal supply, on a privately owned and administered Coal Trust—which might any day get into any difficulties, either with labour or by mechanical or administrative breakdowns—and against which it would have constantly to pit its official brains to avoid being "done" in the price. There is thus, politically, no alternative to National ownership.

Compensation.

7. The question of compensation on expropriation is, in the matter of coal, a comparatively small and simple problem. *Less than the retail price of one year's coal is involved*; only a quarter of what the railways will cost; and fewer than 10,000 separate interests. Moreover, the general principles to be laid down for the guidance of the arbitrators in such an expropriation have been already worked out, with definite precision, by a very authoritative committee, on which the Treasury was strongly represented; namely Lord Sumner's Liquor Trade Finance Committee (England and Wales) 1917, Cd. 9042.

What the community should pay for in such a case has nothing to do with coal or alcoholic drink, or with the ancient history of how the particular private rights came into existence. The compensation is equitably due for a disturbance of established expectations, so far as income is concerned. "The method we recommend," says the Committee, "is that of capitalising the true commercial profit that a concern is normally capable of earning by a factor representing the value of the security for the maintenance of that profit." It would obviously be unfair to take into account either the adverse influences of the war period on this annual profit, or the additions made as the result of the artificial interferences with trade and prices. Thus, we should take, in each case, as the basis for compensation, the pre-war income, and the pre-war estimate of its security as expressed in the number of years purchase that such an income then normally sold for. If we take the pre-war number of years purchase, which (by reason of the rise in the rate of interest) is for all securities considerably more than the present number of years purchase, the Committee recommends that the pre-war capitalisation arrived at should be reduced by a percentage representing the average capital depreciation; or, putting it another way, the issue "to the vendor of such amounts of Government stock as would, if sold at current market prices, produce a sum of money equal to the present cash value so ascertained." (Liquor Trade Report, p. 14.)

As the whole concern would thus be paid for in each case, there would be no valid claim for compensation in respect of particular assets (whether buildings, machinery, stocks, railway trucks, ships, &c.), all of which would pass to the Government as in an amalgamation of companies. The Government would thus be paying actually too much, and it might fairly claim to deduct the five or six years' depreciation and exhaustion of the coal. On the other hand it would only be fair to add to the compensation based on pre-war income the amount of new capital actually put into the concern since the basic year.

Elaborate arrangements are proposed for (a) arbitration; (b) allocation of compensation among the persons entitled; and (c) provision for exceptional cases.

Compensation on this basis would presumably be made payable to

- (a) The 8,000 recipients of Royalty rents and wayleaves (less the Mineral Rights Duty).
- (b) The Debenture holders in the 1,500 Colliery Companies.
- (c) The Preference and Ordinary shareholders.
- (d) The comparatively few individual owners of collieries.

Where collieries are worked primarily for the supply of particular businesses in the same ownership, they might be allowed to remain as they are, subject to all coal not used in the business being placed at the disposal of the Ministry of Mines at cost.

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

It is suggested that the same principles should be applied to the various businesses of factors, merchants and dealers in coal where this forms more than a small fraction of such businesses. A large proportion of the persons employed in such businesses would be offered service in similar capacities, and with not less income, under the public administration. But to all whose services were dispensed with the usual Civil Service Compensation should be paid.

It is not easy to estimate with any precision the total that would be payable, but witness suggests that the amount of Government Stock that would be issued, in satisfaction of all demands, if the principles of the Liquor Trade Finance Committee (England and Wales) are adopted, might be between £200,000,000 and £300,000,000, subject to a considerable recoupment by the Railway administration in respect of the trucks taken over."

11,612. Will you kindly help me there? Your view is that the sum to purchase the royalty rents and way-leaves and the colliery undertakings might be between £200,000,000 and £300,000,000?—Yes, including also compensation to individuals whose services were dispensed with.

11,613. And Government Stock would be given. Have you read out anywhere the rate of interest?—No, I have not gone into that detail. That is carefully explained in the Liquor Trade Commission Report, which I can quote, if necessary, later on; but may I suggest that it is unnecessary to go into that, because there is always the alternative of issuing, let us say, a Four Per Cent Stock at 84, or Five Per Cent. Stock at 100. The point is that whatever stock you issue should be saleable in the market when you issue it, so as to yield the amount of cash which you are proposing to give.

11,614. Have you any views upon the subject as to whether it would be advisable, supposing your theories were adopted, to issue a stock at a certain rate of interest for five years with a reduction of the rate of interest subsequently?—That is what I may call a question of financial technique which it is very difficult to consider. The Government would have to be very careful not to adopt any (what I may call) fancy arrangement, which would make the stock worthless in the market. The Treasury would look after that, and would see that whichever form of stock was issued was most advantageous for the Government. It might be a stock under par at a low rate of interest, or a stock at par at a higher rate of interest, or terminable annuities. But all that is a question for the financial expert.

11,615. Would the stock be a general stock or particular earmarked coal stock?—Personally, I should think it would be more profitable for the Government to issue it as part of the general stock and not to give it a fancy name. I think a fancy name has always a disadvantage. There are always ignorant investors who do not know what it means; and, secondly, you get a much wider market by merging it in the general Government Stock than by merely confining the issue to a stock with a particular name.

11,616. If you had a coal stock, what would be your view of having a special sinking fund to pay it off provided out of the profits of the industry, if any?—It would be undoubtedly desirable that there should be a special sinking fund, in order to be perfectly and pedantically right, in view of the wasting nature of the property. I do not necessarily admit that the coal properties of the Kingdom would be a wasting asset, except at a very long term, but in order to be pedantically correct it would be desirable to have quite a special sinking fund which would arrange for the repayment of the whole of the stock created for the purpose at a much shorter time than possibly might be required for other Government Stocks. And there is this justification for a sinking fund which it might be desirable to add, because a fixed sinking fund has been found from a hundred years' experience not to be very good finance. There comes a year when you cannot afford to pay the sinking fund out of revenue, and then you have to be actually borrowing at probably a higher rate of interest to raise money to meet your sinking fund. But, in the case of such an enterprise as coal mining, the enterprise would itself be providing the sinking fund, and therefore there is,

I think, financial justification for a special sinking fund.

11,617. I am obliged to you. Will you proceed with your proof?—Yes.

Plan of Management.

8. It would be idle, without the detailed knowledge available in the present administration and in the Home Office and the Coal Controller's Department, to attempt to lay down any detailed scheme of management of a Nationalised Coal Supply. But, in order to provide a basis for consideration, witness submits the principles and outlines of such a scheme.

(a) The National administration should, from the outset, be based throughout on (i) Accurate measurement; (ii) Complete Publicity and (iii) Continuous Comparison.

(b) The necessary organisation should be worked out on the lines of (i) Centralised National Determination of Policy; (ii) District Autonomy in Execution; (iii) Participation in the Administration, Central and Local, of all grades of the staff; (iv) Scientific Costing of each section of the operations; (v) Perpetual Comparison of Results as regards safety and health, working costs and output, among the several Districts, Pits, Seams and Methods of dealing with the coal, in order to evoke both criticism and emulation; (vi) Continuous Scientific Research and the obtaining of suggestions from all concerned, for initiative and improvements.

(c) At the head of the whole administration, and directly responsible to the House of Commons, there must be a Minister for Mines, presiding over a Department adequately staffed for dealing alike with the scientific and mechanical, the medical and social, and the commercial and financial sides of the work. Such a separate Ministry of Mines was provided for in the Report of Lord Haldane's Machinery of Government Committee, which had in contemplation the Nationalisation of the Mines.

(d) The Minister of Mines should have the counsel and criticism of a permanent and authoritative National Coal Council, composed of (a) the heads of the principal branches of the central administration; (b) representatives of the various main grades and sections of the million employees, who might be nominated by the Miners' Federation of Great Britain, and (if there should be any grades or sections not then covered by that organisation—for instance, the managerial and distributive staffs) by any other organisations concerned; (c) possibly a representative each of the Treasury and of the public Railway, Canal and Electricity administration; and (d) it is suggested also an expert representative of the domestic consumers, who might be nominated by the Co-operative Movement, which seems to be the only organisation, other than the Central and Local Government, representing the consumers at large."

11,618. Would you just help me there with regard to the Minister of Mines? In your view is it absolutely essential that he should be a Member of the House of Commons, or would you appoint him for 5 years or 10 years, or the tenure of a judge?—No, I am a democrat, and I think it is indispensable that the nation's coal mines should in the last resort be governed, like every other part of the nation's administration, by the House of Commons, and I know no other way of securing that than that of a Minister responsible in a real sense to the House of Commons, and to the House of Commons for the time being. Consequently I think the Minister of Mines ought to be a Member of the House of Commons. He ought to answer for the Ministry in the House of Commons, and he ought to be liable to have a vote of censure moved upon him by the House of Commons, and he ought to bring down the whole Ministry if the censure is carried in the House of Commons. I hold the view very strongly on constitutional grounds that any attempt to secure an absolutely independent administration of the mines would mean that the control of the nation over that administration must necessarily be so much weakened. But, of course, that does not preclude arrangements within the Ministry for securing a very authoritative position both for the views

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

and desires of the employes of all grades and also of the scientific experts.

11,619. Will you now proceed with your proof?—

“(e) Among the principal branches of the Ministry of Mines should be those of—

- (i) SAFETY AND HEALTH, in which the present Mines Department of the Home Office would be merged, and greatly developed;
- (ii) RESEARCH, to be continuously at work enquiring alike into improvements of coal-getting and the treatment, transport and using of coal; into the physiological, economic and social problems of the occupation of coal-mining; and into the commercial and financial aspects;
- (iii) SCIENTIFIC COSTING AND MEASUREMENT, for a continuous, accurate comparison, item by item, of every part of the operations and their results;
- (iv) EQUIPMENT AND STORES, for the common purchase and provision of everything that the most perfect equipment of the mines require;
- (v) ALLOCATION, controlling the supply of the coal to (a) the various Government Departments and Local Authorities, including the railway, canal, electricity, gas, tramway and port administrations; (b) industrial users; (c) domestic consumers; (d) for export and bunkers.

(f) It is suggested that the existing coal districts should each be administered by a District Superintendent, to be appointed by the Minister of Mines, who should be assisted by the counsel and criticism of a Local Coal Council, to be composed of (a) a certain number of the ablest of the Mine Managers and Agents in the District; (b) representatives of the various grades and sections of the employes; possibly also (c) a representative of the local railway and electricity administration; and (d) at any rate for the first few years, the ablest of the present active directors of colliery companies, if these are willing to serve the community for fees on the present scale.

(g) The executive management of each pit or mine would be, as at present, in the hands of a responsible officer, duly qualified, and appointed by the Minister of Mines, with the advice of the Local Mines Council. He would have under him much the same staff as at present, although possibly it may be well to assign a special assistant to look after safety and health exclusively. He should have the counsel and criticism of a Pit Committee, which should be made up, of (a) the principal managerial officials of the mine and (b) representatives of the various grades and sections of the employes. This Committee would be supplied regularly and spontaneously, with all information; and the Manager would consult the Committee upon every new departure. But, in order to secure national unity of policy, the Pit Committee, like the Manager, would be under obligation to carry out every decision of the National Coal Council, to which there would always be a right of representation and appeal.”

11,620. Would you tell me there whether you are in favour of putting the fireman under the Pit Committee or Council or under an Inspector of the Home Office?—I think the fireman, like everyone else in the mine, should be under both in a sense, but I think it is essential that there should be one officer responsible for direction and execution in the mine, and therefore including the fireman with every other person. In my view the Pit Committee should be a constantly acting and influential and effective body, but as the responsibility must rest with the manager (as I call him here) of the mine, it seems to me that the Pit Committee can only be a consultative and advisory committee. Otherwise you are not clear where the responsibility is, and in order that you may hold the manager responsible for everything that goes on in the mine and for the results, he must be in the position to give the orders he should give—orders, as I venture to think, the most sensible manager now does give—in consultation not only with the head of his

department but with the representatives of the staff. Naturally all emergency orders must be given as emergency orders, but I mean when there is a new departure to be made he would presumably talk it over with his Council.

11,621. Will you now please continue with your proof?—

“(h) The note of the whole administration from top to bottom should be the fullest possible publicity for all the facts, whether scientific or commercial, which the Costing Branch would be perpetually expressing in tables and graphs of comparative statistics, and the other Branches in frequent reports, to be widely distributed in convenient form, and which, it is to be hoped, would become the subject of constant discussion and criticism not only at every Council and Committee, but also among the employees of all grades and sections. There seems no ground in the national administration for the secrecy that has hitherto marked business enterprise, or that to which most Government Departments are at present addicted. Democracy, to be effective, requires a very free use of the departmental printing press, the constant invitation of criticism, and an instant public explanation of everything complained of.

(i) It is suggested that the Ministry should keep in its own hands the supply of all the public Departments and Local Authorities including the railway, canal, electricity, gas, water and tramway administrations; all industrial users of more than trifling magnitude; and all the export and bunkers. The supply of coal at the pithead, either free or at a nominal price to the employees, or at a prescribed price to consumers carting it away, would be directed, under national regulations, by the District Superintendent and the Local Coal Council. With regard to domestic consumption (including that of the smaller industrial users), it is suggested that the Ministry should arrange for a regular supply by rail, canal or coasting ship to every railway station, but that the retailing and cartage should be undertaken locally. There might be three alternatives: Either the Local Authority would undertake the business, or it might be offered to the local Co-operative Society—all its customers automatically becoming members; or, failing both these, presumably in rural areas, it might be undertaken by the Public Railway Administration, especially where the present work of the stationmaster is insufficient to warrant a salary making the post one attractive to a good man.

Whether the Ministry should itself conduct the export trade, taking over the present export establishments, whether it should simply employ these, or some of them, as its agents, at an agreed commission; or whether it should leave the trade to them, merely fulfilling their orders at whatever price might be fixed from time to time, may be left for discussion. The position may be much changed if foreign governments undertake the whole supply of their respective countries and come to the Ministry with collective orders, sometimes for a long term.

(j) What ought to be aimed at is (i) Absolute Continuity of Working, so as to guarantee the miners against any Unemployment; (ii) Security by local stocking against any breakdown of supply; (iii) Stability of the price to the home consumer, whether industrial or domestic. There is no warrant for any difference between summer and winter prices, and no need for a rise where there is a fall of snow. It is suggested that every industrial consumer should be guaranteed a supply for a term of years at no more than he has been paying. What he wants is certainty and stability of price, on which he can base his contracts. There is much to be said for fixing a price for household coal that should be as invariable as the postage stamp, and (the Ministry of Mines paying the Minister of Ways and Communications an average rate for the entire tonnage transported) uniform at every railway station in the Kingdom.”

11,622. Mr. R. W. Cooper: There are one or two general questions which I want to put to you before I ask you a number of questions in detail upon your proof. In the first place, what I ask is what I may

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

describe as for the moment your scheme of nationalisation. Is that the scheme of the Miners' Federation?—No, it has not been submitted to them. It is entirely my own suggestion. I might say I have sought to be as helpful to the Commission as I can, and I have not shrunk from putting things down in detail merely as a basis.

11,623. You cannot tell us definitely to what extent they do or do not approve of your plan?—No, they have never seen it.

11,624. I gather from your plan that, broadly speaking, it is that the State should become the owner of what I may call the whole of the coal interests?—Yes.

11,625. Both of the royalty interests and of the colliery interests?—Yes.

11,626. And should pay for both those interests their fair selling value by means of stock such as you have been describing?—Yes.

11,627. If that came to pass, am I right in supposing that all private ownership or working of coal, even undeveloped coal or unknown coal would be put an end to?—With the one exception I have suggested—mines that are worked for the supply of another business in the same ownership.

11,628. And you purposely refer there to collieries that are at present owned and worked, or held and worked, by large iron and steel companies?—Yes, principally.

11,629. To dispose of that particular detail, I gather that you intend to exclude these iron companies, and they should retain those collieries, and, if they have any surplus product which they wish to sell, they should sell that to the coal department?—Yes.

11,630. To finish one point, I observe in your proof you speak about selling that surplus product to the Coal Department at cost, whereas in your pamphlet you talk about an agreed price. Which of the two do you mean?—I mean an agreed price, but it is only fair to point out there would be no other purchasers of the coal. The Government would have to deal equitably, but would not be at the mercy of this particular colliery.

11,631. In other words, they would have to pay a fair price for the coal, leaving a fair profit on the coal for the seller?—Yes. I do not think there is anything between us on that point. I think the Government would deal equitably with those particular colliery owners with regard to any surplus coal they had to dispose of. When I say "cost," I mean to include all that is reasonably fair. I do not necessarily mean the Government should pay to those collieries anything in the way of profit which is more than a reasonably fair consideration of cost. I mean cost, including all such items.

11,632. You do not mean by cost the bare cost of producing the coal?—No, not in that sense; I mean a fair price.

11,633. I think I see what you mean, and I will not pursue that for the moment. Assuming that the State became the owners of all the coal mines in the Kingdom and became a large colliery undertaking, how do you expect the State to proceed to develop any new coalfield? Do you think they might take the risk of the speculation?—I am sure they would. It would be essential, of course, that they should.

11,634. Is it your idea that the final decision as to whether the State should or should not embark, say, on an expenditure of £1,000,000 in starting a new colliery that that should rest on the Minister of Mines?—Yes; that is quite a small item compared with what does rest with Ministers.

11,635. It may be, but £1,000,000 sterling at one venture might be lost, and that is not a small item?—All these things are relative compared with what we do entrust to Ministers at present; it is, relatively,

a small item. I do not think you could trust it to any one man more properly qualified to come to a right decision. By the term "Minister" you mean the Department with all its knowledge?

11,636. Yes. Would he be in any way fettered in coming to a decision by the feeling that he must obtain a vote of the House of Commons?—No, I think not. That has been my experience of Ministers.

11,637. You think he might make the decision and then take the risk of obtaining the confirmation of the House of Commons?—That is the usual practice, and I may say I hardly remember any occasion on which a vote has been refused.

11,638. On the other hand, if the majority of the House of Commons disapproved of the speculation, they might, of course, censure the Minister?—They might, and the Minister would resign.

11,639. Would not the fear of that rather retard the Minister's enterprise?—No, he takes it all in the day's work.

11,640. In other words, you think he would not care much about the vote of censure?—I think, considering the Minister was *ex hypothesi* in sympathy with the majority of the House of Commons, he would not be afraid of a vote of censure and debarred from honestly doing his duty.

11,641. I suppose your idea is that the Coal Department should be run on commercial lines to yield a profit?—No, I should like to say I demur to that way of describing it. I consider one of the great advantages to be derived from the nationalisation of the coal mines is that we should more and more come to regard the supply of coal as a public service, just as we regard the supply of water, and, if I may say so, the carriage of letters.

11,642. You mean by that, as long as the Coal Department simply pays its way you will be satisfied?—I do not mean that, at all, necessarily. I mean, of course, the Department would be run to take into account the obtaining of a revenue, as far as possible compatible with its other objects; the other objects would be the permanent objects, for instance, the effect upon the life of the community. That is a big thing, and the Department would not be fulfilling its trust if it attempted to run the coal business for the sake of making a large revenue—ignoring the non-commercial results to the community.

11,643. You mean to say it would be a reasonable profit maker, but not an unconscionable profiteer?—I consider it could be run with all due regard to economy and thrift and pecuniary advantage, but that should be only one of its objects, and it should not be the greatest of them.

11,644. The welfare of the workers should not be overlooked in the desire to make profits?—No, I would go further than that. It would be inexcusable if the Coal Mine Department were to come forward and say we know there are going to be these accidents; they could be obviated to some considerable extent, but, because this is they are going to make a great hole in the Chancellor of the Exchequer's Budget, we cannot provide the money to prevent them.

11,645. When you first propounded your scheme for the nationalisation of the coal supply, it was a chapter in a book issued by the Fabian Society called "How to Pay for the War."?—Yes.

11,646. The idea was the surplus profits earned from the running of the Coal Department should help to pay for the war?—It was so. The Fabian Society was alive to getting a good selling title and did not put all its proposals in that book. It put the title on the book.

11,647. The Fabian Society intimated their desire to be of some assistance to the Chancellor of the Exchequer in the present financial emergency?—Yes, and I do believe the nationalisation of the coal supply would be financially profitable, as the Post Office is.

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

11,648. And that profit would go in aid of the Exchequer?—Yes.

11,649. Do you think if the collieries were managed by the State and were simply part of a State Department that the same good service would be got out of managers right down to the workmen as is generally got in private enterprise?—That can only be a matter of opinion, and I give my opinion just for what it is worth. I consider that if you take into account what are the real ends and objects of the service you are engaged in there would not only be the same efficiency but there would be a greater efficiency. I am quite prepared to admit possibly if your aim is merely to get profit it is possible there would be a smaller efficiency.

11,650. One would naturally say the influence affecting, say, the manager would be what his aim was. I suppose the manager's aim would be to improve his own position?—No. I do not believe it.

11,651. You think not?—No; I think that is taking too cynical a view. I think the majority of people even at this day who are at work are very largely influenced by the sense of duty of doing their job well, and I believe that stimulus becomes more potent when you are directly in the public service than when you are serving a private employer, and, at any rate, I believe that stimulus and motive are becoming constantly more potent.

11,652. Do you suggest that persons who work are animated by the love of work rather than personal advantage to themselves?—I do not say "love of work." Unfortunately, only a small proportion of the people who work in the world are able to work in a way which they can reasonably be expected to love, but I do suggest that the majority of the work in the world is done already out of a sense of duty. That may seem strange, but I hold to it.

11,653. Now a question or two upon your pamphlet which is put in as part of your case. I see in your introduction to your pamphlet you speak of new mines being opened here and abandoned there. Do you think that is a thing that often happens?—Yes. As I meant to express the fact, I gather that mines are each year discontinued, some mines out of the 3,300, and each year there are new mines or new pits opened, and my suggestion was that those two operations were done without concert at present; that the man who abandoned his mine because he had reasons for doing so was not acting in concert with the man who sank a new shaft because he thought more coal was required.

11,654. There are mines and mines. There might be a small drift in the country worked by two or three men that might be called a mine or there might be a large colliery employing several thousands of men which is equally called a mine?—Yes.

11,655. Have you heard of a reasonably sized colliery being abandoned in the manner you are describing?—I cannot cite from any particular case; I thought fair-sized mines had remained unworked for certain periods. I thought it was put forward as one of the risks of the enterprise that mines were abandoned.

11,656. The risk of losing money in running the mine; the abandonment of a mine generally is the last resort?—I am interested to hear that. Of course, you will notice that that supports my economic point that the price of coal under private ownership has to be always kept at the cost of the production of the worst mine. If the mine never goes out of use we are saddled for ever with the cost of production at the worst mine.

11,657. The nation is getting the best of the coal produced by the worst mine?—It is quite conceivable you might be getting coal at a less price by working more extensively some better mine.

11,658. Then why should you cease working the poorer mine and exhaust more rapidly the better mine?—Perhaps I may explain to you my view. The

function of a unified coal administration would be to determine how much coal was required in the aggregate for the year, for the coming period, and then attempt to work every mine and develop each seam in each mine up to what we should call a common margin of cultivation. It cannot be done precisely, of course, but you would work down to a common margin of cultivation and you would not push your working beyond that margin.

11,659. Do you suggest that each year an estimate would be made of the probable demand of the next year?—As I have explained, I think that is indispensable if you are going to secure absolute continuity of working. I think it is essential to secure absolute continuity of working; and, therefore, in working to a fixed quantity you may always put it irrespective of the momentary demand.

11,660. Would not that practically involve an examination every year of the actual condition of every mine?—Yes, that would be a matter, of course. The Minister of Mines would have to do that for his Budget; not merely the Minister of Mines, but any National Coal Trust would be under the same obligation.

11,661. Supposing the output was increasing year by year and got ahead of the demand?—You will have read in my suggestions that allowing for the demand getting ahead of the production, the production must set itself promptly to get ahead of the demand in order that you may have local stockings to provide against discontinuity and breakdown of one sort and another. That, again, is an advantage of nationalisation as compared with any private ownership that you would be able to work to a fixed possible total which would be in excess for a good many years of any possible demand for that year.

11,662. How do you deal with trade depression? Trade moves in cycles?—In the first place, trade depression is very much more a depression of profits and sometimes a depression of prices than an actual depression in production. The proportion of variation between a year of boom and a year of slump is, as far as we can make out as regards actual production, not more than 11 per cent.; and in the worst year, 89 per cent. of the goods are being produced as compared with only 100 per cent. in the very best year; therefore the variation in the actual consumption of coal would be quite small and would be quite within the margin to which we should be working.

11,663. I suppose you agree that a change of 10 per cent. in the demand for coal would probably bring about a condition of depression with the resultant loss?—Not under nationalisation. There would be no depression of the industry under nationalisation.

11,664. Why—because you would work to the extent to make good the loss?—No, there would be no depression. If you ask whether the amount of coal would not be produced—

11,665. Supposing there was a great depression in the iron trade; the iron trade has a great influence on the coal trade?—Yes.

11,666. Supposing there was a great depression in the iron trade and a lot of blast furnaces were put out and we need to produce the coal at the colliery, how would your scheme obviate that?—That would make a difference of a few million tons on a total of 280,000,000 tons. Allowing for whatever the difference would be which the iron blast furnaces required less that year, all you would need to do during the rest of the year would be to put that coal to stock in order that you might arrive at the aggregate stock at every part of the Kingdom which is necessary in order to provide against breakdown. When you come to make your calculations for the next year you would provide possibly for a smaller total, and then you would restrict the necessary number of persons entering the industry. Each year, it must be remembered, probably something like 50,000 new boys, young men, enter the industry, and the

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

number taken into the industry each year would be varied according to the prospective requirements, exactly as the Post Office does.

11,667. You know now and again you hear of collieries only working three or four days a week?—That would certainly never happen under nationalisation. That, I consider, is a crime: first, a crime against the efficiency of the nation, but, secondly, a very serious offence to the men employed—the fact that men employed in industry are deprived of their opportunity of earning during those times. You do not deprive the horses in the pit of their food.

11,668. That is not the point?—They get that.

11,669. If the consumers cannot use the coal, and therefore do not use the coal, and the pit is only worked half time, how is the State to remedy that?—I am sorry I have not made it clear. The pit would not work half time under nationalisation.

11,670. If the coal could not be used, how would you deal with the coal stock then?—May I explain, as I have explained in my proof, it is necessary, in my judgment, for the safety of the community and to preserve perfect regularity in the passing of the coal into consumption, so that nobody should be short at any moment, that there should be a considerable stock of coal in the Kingdom at all points, and, consequently, the setting up the provision of that stock in the first instance, which would take some years, and the quantity of that stock, which would be varied from year to year, would always supply a margin of supply sufficient to cover variations in the consumption of the remainder of the year until new arrangements could be made. Then the number of persons taken into the industry for the time being would, of course, be varied according to the Budget of that year.

11,671. Then really your remedy for the results from the want of demand is stocking?—No, that is putting it a little too briefly, but I am content to take it that way.

11,672. That is so?—In effect.

11,673. I suppose you know that many classes of coal do not improve by being stocked?—I am aware of that. The stocking would not be made of those coals.

11,674. You know that certain consumers, notably gas companies, object to take stock coal?—They may.

11,675. Do not they stipulate that their coal shall be fresh gotten coal?—I do not know whether we could oblige them in that way.

11,676. Then apparently you think the State would care little for the wishes of the consumer?—I think the State would have the utmost care for the wishes of the consumer; for instance, if I may give a case. The gas companies two or three times during the past three or four years have been so reduced in stock that they have not been able to give adequate light and heat in London, and they have been under the grave peril of having to cut the supply off. That was because the gas companies ran things too fine and were not prepared to go to the expense of the necessary stock.

11,677. Do you not know that some of the gas companies—I do not know the conditions in London—are so situated that they have no stock ground?—These are quite interesting cases. There are cases in which industrial concerns in order to obtain greater profit, have deliberately failed to provide themselves with the conditions of proper public efficiency.

11,678. I daresay you know in many towns in England the gas works are entirely surrounded by the town?—That is so.

11,679. And it is a physical impossibility to have a stock ground?—Pardon me, it is not so as a matter of fact.

11,680. Would you pull down the houses?—You find those gas companies have stocks of coal, but not necessarily at the works. If they have been so improvident as not to get sufficient ground to keep their necessary appliances and requisites immediately adjacent to where required, such imprudent producers have to obtain space at a distance, and they do so.

11,681. You call the gas companies imprudent producers?—Not all of them. Those are imprudent

who have not provided themselves with sufficient space to carry on their business.

11,682. Gas is not a recent invention?—No.

11,683. You know as well as I do, I suppose, that in nearly all the towns in the Kingdom where they are supplied by gas companies, or even Corporations, these gas works are practically surrounded by the town?—No, they are not.

11,684. Are not the large number?—Some are.

11,685. Do you know Newcastle?—Yes.

11,686. Do you not know that the gas company in Newcastle is surrounded by the town?—A very bad example of private enterprise.

11,687. You think so?—Yes, a shocking example. The supply of Newcastle with gas is a flagrant instance; it is a flagrant evil of profit-making gas supply.

11,688. I am keeping to the stocking places kept by it?—If the Newcastle Gas Company has not made adequate provision for stock, that is another instance of it.

11,689. Do not let us become disorderly, and let us keep to the question as far as we can. You suggest in these cases stocking ground should be bought and railways laid to the stocking grounds somewhere in the Country?—I could go into the question of private enterprises which have not provided themselves with sufficient accommodation for the expansion and growth, which is what they should do. The case of the gas companies is like the case of the manufacturer who finds he has not sufficient accommodation for his business and has to make other arrangements. As a matter of fact, I may remind you that the gas enterprises are always making such changes as you are describing. They are constantly ceasing to use the gas plant which they have in the middle of the town and they are providing new and more efficient and larger plant on the outskirts.

11,690. And in course of time do not the outskirts increase and surround the gas works?—Yes, and they go on again and again.

11,691. Should this provision be on the side of the consumer or on the part of the colliery?—There is no reason why proper provision should not be made, just as the Government makes adequate provision for the working of its business.

11,692. That is not the question?—My remedy for depreciation is not stocking, but a reasonable output of production in accordance with the demand. For any momentary case of discontinuing command I suggest stocking is a remedy.

11,693. We will take that for the moment that you suggest stocking is the remedy. You do not wish to restrict the output?—No, not to anything less than required; in fact, it would be the object of nationalisation to produce, at any rate for some years, more than was required in order that the nation might be equipped with an adequate supply.

11,694. You wish to keep the miners as far as possible fully employed?—That is obviously a commercially desirable thing. The lack of it has been one of the great drawbacks of private ownership. A proper stock has not been secured. That is one of the great gains unity would make.

11,695. Do you now know that many collieries are so situated that they cannot carry out a scheme of stocking?—I am not suggesting the collieries should necessarily do the stocking.

11,696. Who should do it, the Government Department?—A stock of coal at a colliery would not be a remedy. A remedy for a breakdown or stoppage by a fall of snow would mean that it is necessary that the stock should be near the consumption.

11,697. In your pamphlet you spoke of one of the reasons for your scheme that "The danger of interruption in the supply of the coal imperatively required by the Admiralty has led to the purchase by that Department of coal mines being very seriously considered." What was the condition of interruption to which you refer there?—So far as I know, there were two kinds of interruption considered. One was the formation of a combination amongst the producers of the Admiralty coal, and the Admiralty did not wish to be at the mercy of any combination of producers of Admiralty coal.

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

11,698. On that point, supposing we were at war, I suppose the Admiralty would not be at the mercy of any combination?—No, I presume not.

11,699. They could commandeer the coal?—The majority of years are years of peace.

11,700. Was not the danger of interruption to which you there refer the danger of strikes?—No, I do not know that; I am not aware of it. The Admiralty can prevent themselves against that by stocking.

11,701. What about those threatened strikes in South Wales during the war?—There were threats of strikes, and there were some steps taken.

11,702. Ministers had to go to South Wales under great difficulties to prevent the strike?—Yes.

11,703. There was a strike?—Yes, there certainly was a strike. I am not aware the Admiralty then thought of purchasing the coal mines. I was referring to previous times.

11,704. Come to the present situation. Do you think if the State was running those Welsh collieries the risks of the strikes of the Welsh miners would be less than to-day?—I would put it carefully; I think they would be less than to-day. I believe that there would be considerably fewer strikes under Government ownership than under private ownership. I think I am justified in drawing that inference, not only from theoretical considerations, but from the actual facts of Government enterprise.

11,705. Will you please let me get a question in if you do not mind? Do you think there would be less risk of strikes because the Government would be more ready and willing to meet the miners' demands in the matter of wages?—I think the Government on the whole would be more equitable. To put it another way, I think the Government would be more responsive to the needs of the miners than any private capitalist in competition can afford to be.

11,706. That is only another way of answering my question. You think they would be more willing to meet the demands of the men in the matter of wages?—I think a very large number of strikes arise from other causes. Strikes arise from acts of what are considered tyranny or oppression or even cheating, not on the part of shareholders, but on the part of the subordinate officials, which the men resent. I think we should do a great deal towards diminishing that kind of friction. I do not think the issues with regard to wages are so frequent or so numerous as to enter very much into the question of strikes. If you inquire into the number of strikes you find the other causes come in very much. It may be in highly organised industry the conflict with regard to wages is the big thing, but it comes least often.

11,707. When it did come do not you think the Government would be more amenable to pressure on the question of wages than the private owner?—I think it all depends upon public opinion.

11,708. Do you think the miners' request in the matter of wages would be restrained by public opinion?—Yes; my opinion is, I am speaking from experience in this matter, that when the persons employed by the Public Authority have public opinion upon their side, by which I mean public opinion very largely of their own class, and the Public Authority gives way, and ought to give way, there is no harm; but directly a person employed by a Public Authority goes beyond the point at which they have public opinion on their side—public opinion of their own class—then the Government or the Public Authority is very strong, even stronger than a private capitalist would be, or might be.

11,709. The point would be as to what was the attitude of the Public Administration with regard to the equity, or otherwise, of the miners' requests?—Yes.

11,710. You speak about tyranny; I suppose you mean everything from want of tact upwards or downwards?—Yes, it is a wide term.

11,711. I agree. Do you think that you have any right to expect that persons employed by the State would be more tactful when employed by the State than by private enterprise?—Paradoxically, I think they would. I think the whole spirit of the administration would tend to be different.

11,712. Do you think they would be less tyrannical?—I think they would be less tyrannical, and for two or three reasons: first, the regulations would require more consideration and less tyranny; secondly, I suppose that, in all probability, there would be a right of appeal, to put it simply.

11,713. Dismissing the right of appeal, and considering the psychology of the Government officials, do not you think a great deal depends upon the Government official?—I say there is a great difference with regard to them, that is to say, between the middle class and the upper class and the wage earning class. As a matter of fact, you do not find the Government officials are at all tyrannical or rude with regard to people whom they think of their social class, but they are when they deal with people whom they think are their social inferiors.

11,714. Do you not think that the mere fact of always being able to get their own way as Government officers is apt to make them more arbitrary?—I was myself a Government officer for 13 years.

11,715. I am not suggesting you are arbitrary?—I am not aware I had a habit of getting my own way. As a matter of fact, the Government officer never gets his own way, never, even a manager. That is one of the contrasts with private enterprise. In any decent-sized private enterprise there is an autocrat owner, and the great difference between a reasonable-sized enterprise and a large one is that the autocrat has to disappear and he becomes a piece of the machinery.

11,716. The great check is the great number of persons with whom he is dealing?—Yes.

11,717. That would be absent if the Government carried on the business exclusively?—That would be so. I must add that the assumption that you may go somewhere else in private enterprise is an obsolete assumption, and one which has been believed in for generations after it has passed away. I cannot go anywhere else for milk.

11,718. Confine your mind to coal. Do you suggest that in Newcastle if I buy coal there, if I come up against an arbitrary official, I cannot go anywhere else to buy coal?—You mention Newcastle. A great majority of the consumers of coal have not that recourse. If you carry your mind to the people in the country, they are obliged to get their coal from the one person supplying coal. The knowledge that there is always a series of competitors whom people can go to is far from true to-day.

11,719. You complain of the army of dealers in coal?—In London and other places.

11,720. What about the country?—There is not an army of dealers in coal in the country.

11,721. You do not suggest the country places are in the hands of one dealer?—Very often.

11,722. In the great majority of cases they are not?—I am less familiar with the country than I am with London.

11,723. You spoke somewhere about the danger of alien ownership. Why should it be necessary for the State to become possessed of all the coal mines in the country to prevent aliens becoming owners of coal mines in this country?—No, it is not at all necessary. That instance was only put in as a fact, as an illustration. I point out in the next sentence, "But the holder-up is not always an alien enemy."

11,724. I am not thinking of the offence of holding up. I thought you were pointing to the danger of aliens holding at all?—The incident quoted is that of an alien who was doing nothing but preventing their exploiting the coal.

11,725. That was a statement made by the President of the Board of Trade when he was referring to the case in Yorkshire. With all due respect to him, the statement is not quite accurate?—I am quite content to take the statement of the President of the Board of Trade on the point.

11,726. Have you heard of a German magnate called Hugo Stinnes? Do you know that he was about to sink a colliery near Bawtry in Yorkshire?—I heard that.

11,727. That colliery has been disposed of by the Board of Trade?—It may not have been disposed of at the time.

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

11,728. Why should the fact that Hugo Stinnes took it after it had been offered to a number of English people be a reason for the State becoming possessed of all the coal mines in the country?—It was never given as a reason.

11,729. It is one of the parts of an introduction which I regard, of course, as being a great principle or reason for the plan?—May I observe there is a certain literary art in this thing, and the alien was brought in as a way of driving in the next statement; "but the holder up is not always an alien enemy."

11,730. The alien was a make-weight?—The alien was a device.

11,731. Lower down there is this: "We, for this reason, suggest that the time has come for the nationalisation of the coal supply"?—That does not follow immediately after the alien; it follows after a holding up by other people not aliens.

11,732. It is the conclusion of the paragraph of which the alien forms part?—It is one of the reasons, and the alien was brought in as a glaring instance to arrest the attention of the reader.

11,733. The alien is one of the reasons?—Yes, certainly.

11,734. On page 4 you lay a great deal of stress on the question of railway trucks and the details of the user of the trucks. I assume those remarks only apply to those portions of the trade where private wagons are in use?—No, not entirely. A large part of the waste of haulage and discontinuity of working due to the separate ownership of trucks—

11,735. That is my point. I assume these remarks of yours only apply to the part of the country where the privately owned trucks are in use?—I was going to explain not only that, but the separate firms of coal merchants are themselves—

11,736. Privately owned trucks, I said?—May I answer the question. The fact of the coal distributing trade being scattered over such a large number of competitors does result in a large waste owing to this multiplicity. I have quoted that the late general manager of the London and North Western said that over 80 per cent. of the coal traffic on the London and North Western Railway averaged less than 20 tons per consignment. It is not only the separate ownership of the trucks, it is the small separate consignments which are due to the fact of the separate private competition amongst the larger coal merchants which causes so much of the waste.

11,737. Do not the railway companies prescribe the size of the truck loads?—I suppose they do.

11,738. In doing that I suppose they have regard to the requirements of the customers who possess their own trucks?—I have not said anything about the size of the truck load. It is the consignment that is so small. If you have to distribute a good many million tons of coal in a number of small consignments under 20 tons each, each to be sent separately, you undoubtedly get your train made up of a number of separate loads which increases the cost very much. Coal is at present carried from Leicester pits to King's Lynn at 3s. 4½d. per ton net rate, yet to London for distribution, which is, of course, about the same mileage, and a straight run, it costs 6s. 7d. The reason of this in the case of King's Lynn is that a complete train load is taken straight through, tipped into the steamer and brought back; whereas to London the wagons have to be collected together at a suitable connection, which entails considerable shunting. Then when the train load is made up and is brought to a London sorting station the wagons are divided up into a few wagons to each merchant here and there, entailing more shunting. This would not be necessary at Government controlled depots; the coal could be brought forward in one train load straight into a station and cleared quickly. Obviously the carriage rate could be reduced in comparison with the reduction in labour, &c., for shunting purposes. Consequently the trouble is not due to the private ownership of wagons, but the large number of small consignments. You must have co-ordination and unity in your distribution of coal as much as in the production of coal.

11,739. Do you mean that the consignments ought to be made bigger?—Yes, I should imagine London

would be supplied with coal in large train loads every day; single consignments.

11,740. Do not large train loads of coal come into London every day?—Yes, that is just what I have been endeavouring to explain. They come, but they are made up to the extent of 80 per cent. of separate small consignments going to different merchants, factors or consumers. The result of the separation of ownership is that the wagons have to be shunted to and fro and backwards and forwards in order to get them to their right place. That would be avoided if there was greater unity in the distribution.

11,741. I will come to your proof for one moment. In your proof you refer to the expressions used by Sir Richard Redmayne, "extravagant and wasteful," which I think, you are aware, was based upon the report of a committee called the Coal Conservation Committee?—Partly only.

11,742. As regards the Coal Conservation Committee, whatever points in that were made the foundation for the use of those two adjectives, this was the remedy proposed by the Committee?—That may have been so.

11,743. You have read the report, of course?—Yes.

11,744. One of the functions of that Committee was to investigate matters of that sort and to suggest a remedy?—No, I think they were on the sole point of the economising of the coal.

11,745. It was coal conservation?—Quite so. You would not suggest the judgment which Sir Richard Redmayne gave expression to was based entirely on the question of the conservation of coal. It was not even Sir Richard Redmayne's judgment. He said that the fact that the present system is extravagant and wasteful is, I think, generally accepted.

11,746. That is his statement?—I know, but my statement is that he said that the extravagance and waste was generally accepted.

11,747. My point is, was he not accurate in basing that in his evidence on the investigations conducted by the Coal Conservation Committee?—No; I suggest he was only referring to that as one instance. Will you look at page 5 of his proof, where he says the present system of individual ownership of collieries is extravagant and wasteful, and so on. The things he mentions there are elaborated under nine different heads, and not one has any relation to the suggestions of the Coal Conservation Committee for the greater economy in the nation's store of coal.

11,748. No. 6 has?—If the economy of colliery consumption was one of the principal items of the Coal Conservation Committee's report, it has passed away from my memory in view of the great stress they laid on other things.

11,749. They dealt with coal consumption, waste of coal at the pit heads; loss of coal underground; loss in working with regard to thickness; loss from coal left for barriers and loss of coal left underground; loss of coal from water logging and loss of coal left for supporting, and so on?—That seems to bear out my point that the saving which they anticipated have no relation to colliery consumption.

11,750. On the question of houses, is it not a fact that in many mining districts the mining population is intermixed with other individual sections of population?—That is so; it is perhaps less the case with regard to miners than any other industry.

11,751. It applies to a considerable extent where the mines are in the vicinity of the town?—Yes, that is so.

11,752. You do not, I suppose, suggest that in those districts the overcrowding which unfortunately we know prevails is peculiar to the miners' houses only?—No, I should imagine not; I have not suggested it is.

11,753. All the figures that are given in the return relate to the district as a whole and not mining only?—With regard to overcrowding but not with regard to infantile mortality.

11,754. You seem to think that the colliery managers at present are deterred by their anxiety to keep down expenses?—I have suggested that there is a permanent pull against any costly improvements in the pecuniary self-interests of the mining concern. That is not meant as any indictment of the concern; it is only a necessary incidence of the reliance of

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

private and pecuniary self-interest as a method of carrying on business.

11,755. You suggest under a system of Government management by free intercommunication of results there would be a certain relationship amongst the managers?—Yes. I should like to say on behalf of the managers they are deprived by the system of separate ownership of collieries and the lack of opportunity of communication, of the opportunity for emulation and comparison which any properly organised industry I think ought to give.

11,756. Although what I suggest is not universally true because it depends upon the individual, do not you know there is a very large amount of interchange of ideas amongst managers now?—I am aware that managers in a particular coalfield frequently meet each other. I am aware of their Association of Colliery Managers, and they compare notes. I may say that both those facts taken together amount to a very trifling comparison in contrast with that which in well organised industries there ought to be.

11,757. I will take you on the question of comparison of cost. Do not you think, and I quite agree comparisons are useful, the more the comparison the greater the desire on the part of every manager to make his results look as favourable as possible?—Certainly; that, I think, is a very important feature.

11,758. Therefore, to a State servant or a private servant there would be the same desire to keep down the expenses?—To keep down working cost; but it must be remembered under any scientific system of costing considerable allowance is made for different details.

11,759. I am not talking of the system of costing, but the effect on the mentality of the manager?—The first point with regard to the mentality of the manager is, in so far as it is affected by comparison it is, with regard to the profitability of his enterprise.

(Adjourned for a short time.)

11,767. Mr. R. W. Cooper: We were on the question of accidents, and I believe I had just touched on your paragraph about pit props when we adjourned. I notice you say this: "The enormous number of accidents caused by the insufficient use of pit props to prevent falls of sides and roofs is significant. Pit props are now expensive?"—Yes.

11,768. We knew, of course, that during the war pit props have become very expensive. Do you mean by that paragraph to convey a suggestion that because pit props have been expensive during the war there has been undue parsimony in providing timber?—What I actually meant was that you have the permanent pull of two motives: one is the motive of not wasting more money on timbering than is absolutely necessary, and the other is the common desire to prevent accidents; and those two motives must be in conflict.

11,769. Truly; but both these motives must exist in the mind of a State manager just as in the mind of a private manager, if the man is doing his duty?—That is so; but the suggestion is that under a system of profit-making the motive of saving expense is very much stronger, I consider, than under a system of public ownership.

11,770. Now with regard to pit timber, and so forth, I need scarcely remind you, of course, that there are very considerable obligations imposed on a manager of mines under the Mines Act with regard to providing an efficient supply of timber?—That is so; but I suggest that no system of compulsory obligation and regulation can ever be more than generally effective, and especially when such a system cannot be very exhaustively inspected.

11,771. I am still rather puzzled to know why, if the manager was employed by the State instead of being employed by the private individual, he should be any keener in carrying out the obligations which the Act of Parliament imposed on him. Why should he?—The suggestion is that he would not be quite so keen on economising the use of timber.

11,772. Do you suggest that that would affect his proper discharge of the obligations imposed upon

11,760. You are wrong there. The manager has very often no idea of the profit. The only knowledge of figures he has is the working cost. He has no idea of the price, because that is managed by an entirely different department, and very often in a different town altogether. How do you mean it affects the conditions and affects the manager's mind?—That is rather an element I may agree upon. As far as I know about managers, they are thinking not of the cost, but the expense. That is a different thing.

11,761. What is the distinction?—If the manager's wages go up the expenses go up, but the cost has not gone up.

11,762. I must be very dull, but cost and expense seem to be to me the same thing?—That is one of the great differences which is the great benefit of nationalisation. You would be able to distinguish those two different things. The cost of production is the sum of the efforts and sacrifices which all the persons concerned make—

11,763. I am talking of cost of production not in that scientific sense?—I can only talk of it in the true sense.

11,764. Will you address me colloquially rather than in the scientific sense?—One of the great advantages of nationalisation will be that the ideas of some of the people connected with coal mines will be purified. In that way, instead of being governed by the question of expense, and therefore profit, it will be possible to have regard to the real incidents and not to the difference between expense and price.

11,765. You think one of the results would be a sort of psychological exaltation of the colliery managers?—Yes, they will be purged from the dross of carrying on for profit.

11,766. That nationalisation would have a very spiritualising effect?—That is my view.

him by the Act of Parliament?—Yes, I do suggest that it is not possible to prevent that very natural motive being always at work.

11,773. Notwithstanding the fact that if he is found out or if an accident happens or an inquiry is held he is liable to punishment?—Yes; because there is a very considerable margin between the amount of neglect which would be held to be culpable negligence and the mere ordinary economy. After all, a manager is not criminally prosecuted except in cases of extremely culpable neglect. In the last year for which the Home Office has reported up to the present I do not think any person was prosecuted for failure to use pit props.

11,774. That may be; but are you not entitled to draw the inference from that, that on the whole all the persons who were responsible for the fulfilment of the Mines Act were doing their duty?—No; I want to say generally that I do not think with regard to any of these classes of accidents we can infer from the paucity of prosecutions that in every other case the people were doing their duty. I could quote from a Home Office Report in support of what I say, but I will venture only to read one paragraph: "Proper economy in pit timber is undoubtedly a matter of pressing importance, and there is no objection to the withdrawal of timber in such a manner and to such an extent as is consistent with safety, but the provision of an adequate supply at the working places as required by the Coal Mines Act is still more important as being essential to the safe working of mines. Economy can and must be practised without infringing the Act and endangering the lives of persons employed in mines." I infer from that that they had need for putting in that proviso. As a matter of fact, I find there was one case of a mine which was not and had not been carried on in conformity with the Coal Mines Acts in many respects: "The offences relating to the supply of timber were of a serious nature. In certain places the roof under which the work was carried on was not adequately supported (as required by Section 50 (1) of the Coal Mines Act, 1911) and a sufficient supply of timber or other material suitable for supports was not kept

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

within 10 yards of every working place as required by Section 51 of the Act. The workmen were, if they required timber, to draw it from the waste or other disused places. The defence urged was that what had been done was done with a view to economy in the use of timber, as instructed by the Controller of Coal Mines, and with due regard to safety." That is the only case of a prosecution, I believe, during the war, and the Agent and Manager were fined £110. I only quote that as an instance of what does happen. In that very serious case a prosecution took place, but I do not think I am speaking without knowledge when I say that there is every grade of neglect down to that point which is not prosecuted.

11,775. That particular year that that is dealing with is referring to war conditions?—That is so.

11,776. When, of course, we all know that there was great difficulty in getting timber?—I am afraid that I cannot believe that the desire to economise timber was stronger because of war conditions than it would be because of the desire to save money.

11,777. Think for a moment. Do you not think that, having regard to the straits to which the collieries were put, having regard to the timber supply, and everything else, there was a natural desire to economise the timber simply because they could not get as much as they wanted?—I quite grant that in that case you had an accumulation of two motives, and, therefore, there was a special reason.

11,778. They could not help themselves?—Possibly.

11,779. Now you mention another source of accident as though that might be cured under State control. You mention, for example, detaching hooks, and so on, as if they were not universal, and if not, why not? They are provided for by the Mines Act. Section 40 (2) of the Mines Act makes them obligatory, unless you get an exemption, in which case the responsibility must rest on the Home Office?—I am afraid I am not sufficiently acquainted with the technicalities to say why these things happen; but as a matter of fact you have cases in this year of accidents from overwinding which killed three people.

11,780. That may be; but my point is this: these things are already provided for in an absolute manner by the law?—I quite grant that there is an Act of Parliament requiring these precautions to be taken; but that is my case, that no Act of Parliament merely requiring precautions to be taken, even under heavy penalties, is efficacious in all cases when it comes into conflict with the motive of private enterprise and profit making. There will always be cases where it is evaded. That is my case, that not even the most stringent Act of Parliament can be efficacious in preventing these accidents under private enterprise.

11,781. Under your State enterprise you do not propose to eliminate profit?—I do propose that none of the persons concerned with the management of the mine shall have any interest in making a profit.

11,782. In one sense, they have not now, because they are paid by fixed salaries, and their primary duty is to show that they are working on a proper scale. I suggest that the same conditions would apply exactly to a State manager as to a private manager?—I am afraid I am not able to agree with you there, and again I make a concession: I am conceding in my answer that under State management there would not be so strong a motive for pecuniary economy or for increasing profit, as you call it, as under private management, because there would be the stronger motive at work of increasing safety.

11,783. You mean that that motive would be operating more strongly in the minds of the managers?—I think so, because the other motive would be operating less strongly.

11,784. The manager, of course, is not a philosopher, and we will assume he is an ordinary practical man of business. Would he be actuated by ordinary business considerations in the discharge of his duty?—I think he would be actuated by ordinary business considerations in the discharge of his duty, but ordinary business considerations always give a very large part to the making of profit.

11,785. They do not, as a rule, allow much play for sentiment, even under a Government office?—Possibly. That is my case, that there would be more play for sentiment, because he happened to be employed by an employer who was not pressing for the largest amount of profit.

11,786. May I ask you, before I finish these small points about accidents: You talk about no provision for dust. The Act contains a provision for dealing with coal dust. There are very elaborate provisions in the Act, beginning with Section 62, which formed the subject, as I daresay you remember, some years ago, of very great discussion?—Yes.

11,787. Which discussion was the result of discussions in which the miners took part?—I am afraid that is the same point.

11,788. You give me the same answer to that?—Yes, that under private ownership of the mines the most stringent Act of Parliament with regard to the prevention of accidents cannot prevent accidents so efficaciously.

11,789. To put it shortly, although you admit that every one of these points is covered by law already, you say that the psychological effect is that the law is not so well enforced as it might otherwise be?—That is so. It is not possible to manage any industry on the basis of inhibition. Inhibition is a broken reed with regard to social organisation. It only comes in in the grossest cases.

11,790. You refer here to what I may call the financial effect of accidents on the employer. Do you agree with me that accidents cannot possibly pay an employer? I do not know whether you are familiar with some of the practices in the North. In the case of a fatal accident in the pit, the pit is idle for the rest of the day, or if it occurs after two o'clock in the afternoon, then it is idle the following day. I say nothing of the financial responsibility under the Workmen's Compensation Act. Surely must that not represent a dead loss to the employer?—Certainly. I am not contending that accidents are not a source of loss to the employer, that is to say, since the passing of the Workmen's Compensation Act or the Employers' Liability Act.

11,791. In the case I am putting to you, the loss which an employer suffers in the way I have described, much outweighs anything he suffers under the Workmen's Compensation Act, against which he may be insured?—Yes, I can believe that that is so.

11,792. Therefore, to put it on the lowest ground, there is the strongest possible motive on the part of the employer to obviate accidents?—To obviate fatal accidents.

11,793. Now let us come to the non-fatal accidents. As you know, under the Workmen's Compensation Act, there is a long-continuing liability?—Yes.

11,794. That cannot be altogether satisfactory to the employer?—I quite grant that an employer has to pay for accidents. My case was that he would have to pay more for preventing them.

11,795. There I join issue with you, I do not think he would. I notice that you refer to the Employers' Liability Act. That, I suppose, is a sort of historical reference. You knew, do you not, that that Act was very limited in its scope?—Yes, I remember that it was bitterly fought by the employers for a whole generation.

11,796. I am not here to defend the old-fashioned Toryism of the old class of employers, but you know that it was very limited in its operation?—It was discovered to be largely in consequence of the amendments which were inserted in the House of Commons when it was passed.

11,797. Was that Act not the result of a Special Committee about 1877 or 1878, of which Lord Bramwell, I believe, was the Chairman?—The first Act was 1880.

11,798. But before the Act was passed, there was a Special Committee which sat?—I do not think the Special Committee amounted to much; it was really due to the long-continued agitation of the miners' organisation and the railwaymen.

11,799. It was not an Insurance Act at all: it was simply an extension of the common law doctrine of negligence?—I would put it in another way. It was

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

a removal of some of the figments which had been invented by the lawyers for the protection of the employer.

11,800. Being a lawyer yourself, why do you speak so scornfully of lawyers?—What I am so passionately angry about is the way in which a whole generation was exploited for profit-making.

11,801. Then the whole thing is profit-making?—Yes, profit-making: it is not any special wickedness on the part of the employers.

11,802. Do you expect this world to go on unless it is actuated by motives of profit-making?—Yes, I do think the motive of self-interest and profit is a decaying motive which the world is already becoming fit to get rid of more and more. I think the ground is open for increasing the other motives which I think influence higher conduct.

11,803. You are more hopeful of a great moral change than I am?—It is not so much a moral change. May I suggest that we are all self-interested in a certain sense. There was a very clever remark made by a German a generation ago. He said: "The motive of profit and self-interest is like steam in a steam engine: I cannot tell what it will do or in what direction it will work until you tell me under what pressure it is working." Now, if you have a system of private ownership of business, very likely the motive of profit is indispensable, but if you have another system—namely, that of nationalisation, then possibly you are altering the pressure under which the various motives are working; and so, without any moral improvement, you might get quite a different result.

11,804. You seem to me to lose sight so much of the everyday fact of the character of human nature?—No, pardon me, I was trying to explain that it was not so much the character of human nature as the pressure under which you make human nature work. You can alter the pressure under circumstances, and, therefore, get quite a different result from the same human nature.

11,805. Is not the pressure the result of human nature?—It is, but fortunately we are able to alter that, and in that sense we can alter human nature.

11,806. Now you come to the question of disease, and there you practically throw the blame, if I may use the expression, on the Home Office?—Hardly upon the Home Office, but upon the Home Office confronted with the strong opposition, and the quite natural opposition, of the private owners of the collieries.

11,807. Will you tell me, what evidence have you in support of that statement; when has there been any attempt made by the Home Office to effect a change which has been defeated by the influence of the employers?—I will give you the first one that comes into my head, namely, that the Home Office did propose in 1911 to make pithead baths universal, but it was met with such a torrent of opposition in the House of Commons that this had to be departed from, and pithead baths are still not compulsory at all.

11,808. Do you not think that that is one of those expedients that happen from time to time in the House of Commons?—I would rather put it down to the inveterate habit of compromise on the part of the Government.

11,809. It might be from their desire to get the Bill through?—The Home Office does what it can, but it finds so much resistance owing to the profit-making motive that it cannot get through what it would wish to get through; therefore it has to accept compromises.

11,810. Surely the Government is strong enough to carry anything like that through against the opposition?—I am afraid no Government is strong enough to carry a thing through against the opposition of the whole capitalist class.

11,811. You do not suggest that the whole capitalist class would oppose the institution of pithead baths, do you?—I am afraid that the organisation of capitalism is very potent.

11,812. But not so potent as your friends opposite?—I am afraid the result shows that it is more potent.

11,813. Then we must agree to differ. Now, with regard to infant mortality I observe the causes to

which you ascribe that, but do you not think that a good deal of the infant mortality is due to ignorance?

—Certainly, a great deal is due to ignorance, and a great deal to misconduct, but the point is that I do not know how to draw an indictment against these million of people who are miners as against the other million who are agricultural labourers. I do not believe that the girls who happen to marry miners are more ignorant in the total than the girls who marry agricultural labourers.

11,814. I am not talking so much of the housing conditions, but do you not think that their general conditions in which they live, their modes of life—do you not think that their habits of life and the conditions under which they generally live are not so conducive to health as those agriculturists?—I do not know about their habits, but I agree with you that the conditions of life under which they live are not so conducive to infantile health as in the case of the agricultural labourers, and it is to those conditions that I have directed attention. It may seem a small matter, but I cannot help believing that the special infantile mortality of the miner is due to their coming home in their pit clothes.

11,815. I cannot see that. I should be disposed to agree with you that bad housing affects it, but I do not think you can put it down so much to the way the collieries are carried on?—I put it down to dirt in the miners' cottages.

11,816. Have you been into many of the miners' cottages yourself?—Not many, but I have been into some.

11,817. Were they clean or dirty?—They varied; sometimes they were very dirty. I do not mean some of the cottages were; I only mean that at some periods of the day the operations were dirty.

11,818. Have you been in a miner's cottage when the father or son had just come home from the pit?—I have never actually seen the washing operation.

11,819. I have. I have seen them go into the bathroom to get the bath?—The cottage I went to had not a bath.

11,820. Do you not think that the cleanliness or otherwise of the house depends very much on the character of the occupier?—I think it depends very largely on the character of the occupier, but there is no reason to suppose that miners, apart from the special disability of having to bring the coal home with them in their clothes, are less cleanly than the agricultural labourer when you are dealing with the million. It is a startling thing that you have the whole million miners with two-thirds as great again a death rate among their infants as you will find among the whole million agricultural labourers.

11,821. You do not suggest that the miner is desirous to take a bath directly he comes home, though the bathroom may be there?—I have not struck one with a bathroom in my little experience, but the mere fact that a man does not take a bath directly he comes home is no part of the case. I venture to say he ought not to be in those working clothes at all.

11,822. Suppose the man does not take that view, why should you suggest that he is uncivilised just because he prefers to wash at home?—I am afraid my judgment as to whether he is uncivilised or not will depend on his mind. What I propose to do is to operate on his mind by providing facilities and making it convenient and comfortable, such as providing a pit uniform.

11,823. Do you mean pit clothes?—Yes.

11,824. He has pit clothes now?—Yes, but they should be kept at the pithead in a locker with a key. At first you would have some miners who would say they would not do it, and I should let them alone; but I believe in a very short time you would have a rapid increase among them. I am not speaking altogether without warrant when I am saying this. There is one colliery where they do have pithead baths, and when they were provided they found at first that there was some reluctance to use them; but what I have read in the reports is that that rapidly diminished, and that now a very large proportion of the miners make regular use of those pithead baths.

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

11,825. *Chairman*: Is that at Atherton?—Yes, at Atherton in Lancashire.

11,826. *Mr. R. W. Cooper*: So that really the difference between you and me comes to this: It is a difference between the bath being at the pithead and at the miner's house?—I think that is the vital difference; and very likely the lives of 30,000 or 40,000 babies a year depend on that. I cannot say that for certain, but I suggest that is the biggest cause of the mortality among the miners.

11,827. Does that remark of yours apply to a complete up-to-date modern cottage. That is to say, you say although a house may be a complete up-to-date house, simply because the bath is in the house instead of at the pit head, that that is the cause of the mortality?—That is a hypothetical case which I have not come across, and it is not likely to be the typical case for many years to come. Before you can have an up-to-date cottage throughout the whole industry a whole generation will have to elapse.

11,828. I can point to places where 30 per cent. of the houses are furnished with bathrooms?—I am glad to hear of that enlightened district; but if you take out the number of rooms which are available for the million miners' families at present, and the time it would take to convert those into five rooms and a scullery for each family, it would take a generation. I do not want to destroy quite so many babies' lives as that would involve.

11,829. This figure of 160 per 1,000 births, I understand, is from the Registrar-General's Returns?—Yes—for 1911.

11,830. I have a copy of Hansard for the 19th March, 1919, and I observe that Mr. Pratt, answering a question in the House of Commons, said in the following administrative counties, where over 10 per cent. of the total labour is the work of miners, the infantile mortality for the year 1915 was as compared with 110 for the United Kingdom as follows: Nottingham, 102; Derby, 128; Carmarthen, 102; Denbigh, 109; Glamorgan, 150—then he says that these figures may be taken as representative for these years.—I may observe that Mr. Pratt is a Junior Lord of the Treasury. When I go for statistics I go to the Registrar-General.

11,831. Where does the Junior Lord of the Treasury get his figures from?—I do not know.

11,832. He is speaking before the House of Commons.—Just as you are speaking from the brief that has just been given to you. You could get up your case better. May I explain? The statistical difficulty is this. It is not possible to get any useful figures unless you can take the whole class of miners as compared with another whole class. The comparison between the inhabitants of a given district and another district is not useful because they include people who are not miners. So far as I know the only case in which the statistics of the infantile mortality of a class have been taken out are those of the Registrar General in his report for 1911.

11,833. Now on the question of nationalisation, among the advantages which you suggest is the getting rid of competition, and I think it was already suggested by Sir Richard Redmayne that there was competition amongst collieries for stores for new equipment?—Yes.

11,834. Supposing there was only one buyer, namely, the State, do you not think that the persons with private stores for equipment would combine to make a ring against the State?—They might, but they could do it much less easily than they can against the collieries.

11,835. Surely that is not so, because if there are 1,500 people all coming to them with orders, why should they be able to combine any better against them than against the State when they have only one buyer coming to them?—As a matter of fact, of course, the State would promptly set to work to manufacture its own if it was held up.

11,836. Then it comes to this, that you would propose to nationalise stores and equipment as well?—No, I have not said that. This is not special to nationalisation; it is common to unification. I say if a national coal trust found that it could not get the best terms from the stores from which it bought

it would probably pay that concern to manufacture for itself. It does not pay any one of the 1,500 individually, but it would pay the State immensely.

11,837. You suggest that it should be that particular branch of trade?—I say that they would keep the contractor in order, just as the Government has kept the contractors in order during the war. I am not speaking without warrant. This question has been gone into very elaborately in connection with the Railway Companies. There are only a few scores of railway concerns effectively separated, but when it was looked into on behalf of the Government to see what economies could be made by single purchasing the requirements of the Railway Companies the estimated economies run into many millions—something like 20 per cent. on the cost of stores and equipment, owing to unified purchases. Of course, that has been the experience of one concern after another where a trust has been substituted for separate ownership, that the cost of obtaining the necessary apparatus and stores is found to be very much less.

11,838. Surely you would find that all these various suppliers of stores in the case of a national trust would not be content to die without a kick?—I think they might die with a kick.

11,839. Have you amongst your records any records showing the number of fatal accidents per 1,000 in mines over a long series of years?—Yes, the Home Office publish these statistics. They give the number of deaths per million tons. I have not the figures by me, but, of course, they show a very considerable reduction. (*Mr. Frank Hodges*): They have been put in. (*Sir L. Chiozza Money*): I asked for them. (*The Witness*): The fatal accidents show a considerable reduction per million tons, but I should like to point out that we have not any record in relation to the tonnage raised of the non-fatal accidents. The fatal accidents in mines are relatively so few, fortunately, that it would be much more satisfactory to have the way in which the number of accidents varied with the tonnage. At the same time I do not wish to suggest that there has not been a relative reduction in accidents in mining. It would be a very great disgrace to the industry if there had not been a reduction; but there has been a great reduction, certainly in fatal accidents, and, I expect, in other accidents.

11,840. You have already answered my question with regard to compensation, but I should like to ask you one or two questions about that. I observe in your pamphlet you set forth your views with regard to compensation?—Yes.

11,841. You there say, "There can be no justice in penalising a share and debenture holder in coal-mining companies more than those in other capitalist enterprises that we leave unexpropriated." Do you contemplate nationalising other enterprises as well as coal?—Really I am not able to keep up with the rate at which this is going on. The Government have decided to nationalise the generation of electricity, which is a large enterprise, and last December it was decided to nationalise the railways. I cannot keep up with it.

11,842. Then you look forward to other forms of nationalisation?—I think it is very probable.

11,843. Then you go on lower down to discuss the basis of valuation and say, the 16½ millions—that is sterling—which was proved to be the average profits of the coal industry, including royalties, for the five years preceding 1913, included incomes of different values which must be taken separately?—Yes.

11,844. You mean by that, of course, in ascertaining the capital value of royalties you would take a different number of year's purchase to those on which you would capitalise the value of the collieries?—Yes; as expressed by Lord Sumner's Committee, you take as a factor the number of years which represents the security.

11,845. You are not speaking of the royalty?—It is all the same to me.

11,846. Lord Sumner was dealing with commercial profits.—Pardon me, not exclusively. He was including the freehold interest in the buildings and land.

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

11,847. But then, of course, those two elements had not the differing values that these two have in the coal mines?—They have differing values which may be more or may be less. I think the principle is applicable.

11,848. My question is, why you in your proof go to Lord Sumner's Committee instead of adhering to your own pamphlet?—I do not think there is any difference between what I suggest in the pamphlet and Lord Sumner's Committee.

11,849. In your mind there is not intended to be any difference between the two?—No. I only quoted Lord Sumner's Committee because it is always desirable to shelter one's self behind a high authority, and, if possible, the House of Lords.

11,850. Lord Sumner's Committee, when they talk about interest, attached to it a special definition. I mean that is an expression used by them as defining what they mean?—Yes.

11,851. They also said that although they took a datum period special provision must be made for special circumstances?—Yes.

11,852. And so with regard to coal mines I take it you would have to make a special provision either way for special circumstances?—Yes, certainly; I have suggested it.

11,853. Now, a word or two about your plan of management. You suggest management by a district superintendent?—Yes.

11,854. Do you mean that one man to be a sort of district dictator?—No, I think that would only be a term of abuse when we did not like what he ordered. I meant administrator.

11,855. Who are to be in the majority on the proposed local Coal Council?—Really, I have not thought it necessary to be precise about that.

11,856. What interest do you think should preponderate or command the majority on the proposed local coal council?—I do not think it is very important where you have the majority, because I only propose that it should be an advisory and consultative council.

11,857. Is that all?—Yes.

11,858. Only advisory?—Yes, in all cases.

11,859. I understood what you said about pit committees being advisory?—Yes, I said it quite clearly.

11,860. If that was the case the real director or governor would be the district superintendent?—Yes, I have said so—to be assisted by the counsel and criticism of the local coal council; and I have suggested that it should consist of a certain number of the ablest managers and agents and representatives of the employees.

11,861. But only acting in an advisory capacity?—Only acting in an advisory capacity.

11,862. Therefore the real master of the manager would be the district superintendent?—That is my view. The final master would be the Minister of Mines.

11,863. What sized district are you thinking of?—That I am not competent to decide.

11,864. What have you in your mind?—I assume that Northumberland would be one district.

11,865. You know that Northumberland is one-third the size of Durham?—Yes; and I would take Durham as another.

11,866. Durham in peace time with 40 millions output represented by 100 different concerns—do you think one man could very well manage all those?—I think one man can manage the whole British Empire. There is no difficulty at all. It is only a question of hierarchy and sufficient members of the staff.

11,867. All the members of the hierarchy must be more than mere advisers?—Pardon me, in arranging an administration you do not consider how large it is. You put one man at the top.

11,868. Can you invest all with power?—Certainly. Everybody in the mine, in my view, right down to the youngest boy, will be invested with power and charged with a duty.

11,869. As between the manager of the mine and the District Superintendent, who would there be?—I have not provided for anybody in between those two, but of course if you had a very large district it might be desirable to have assistant superintendants.

I have not gone into that. There would still be a District Superintendent even if he had assistants.

11,870. I gather from what you say that you do not intend that there should be emulation among the State managers to produce their coal cheaply?—I hope there will be emulation with regard to every part of their work. The consideration of cheapening working costs would be only one; but I hope there would be just as much emulation in the prevention of accidents.

11,871. You think that would be stimulated by publicity?—Certainly, it is impossible without publicity.

11,872. Do you not think, human nature being what it is, managers would be more desirous to show cheap working coal and leave the expensive coal alone?—But the District Council would soon bring that to light.

11,873. Do you think that the District Council having the control of Durham could do it?—Certainly. Really, I must again fall back on general considerations. You only have one governing council for the British Empire.

11,874. You fall back on general considerations not unnaturally, but I put it to you—and I do not wish to do it offensively—that you yourself have no practical knowledge of carrying on a coal mine?—I am very glad to say I have not.

11,875. *Mr. Arthur Balfour*: I have heard your proof read with great interest. I take it, we may assume from it that you are unconditionally in favour of nationalisation?—Yes.

11,876. How have you been able to come to a final decision of that kind without having a big inquiry like that which we are holding at present?—It is necessary that people who study these questions should make up their minds. I have made myself master of such available information as there is on the coal question, and, after all, I am only responsible for forming an opinion, and I place that opinion at the disposal of the Commission without any desire that it should count for more than an opinion.

11,877. It is really an opinion without your having had an opportunity of investigating it on a large scale?—Pardon me, I have had an opportunity of investigating it on, perhaps, a larger scale than most people.

11,878. Where have you had that opportunity?—Truly, there is no actual case where it has been carried out on so large a scale. I have not, certainly, known any analogous case, but, after all, I have been studying public administration all my life. I have seen and written a great deal about public administration in all its forms, including a very great substitution of public administration for private enterprise which has been going on in the world for the last generation, probably greater than most people are aware. I have studied that. I cannot profess to know everything about it, but I have done my best, with my means, to obtain the material for forming a judgment by considering and investigating what has happened in a good many different countries and a great many different services. I actually was on the London County Council for 18 years, during which a great deal of municipalisation on a considerable scale was done, in which I took part.

11,879. If it was shown to you that the result of the German nationalisation of coal mines was a failure, would that alter your view at all?—There has never been any nationalisation of the coal mines in Germany.

11,880. But they have State owned mines?—Quite so. That is a different thing. The mere fact that the Government owns some of the establishments in a particular industry is not nationalisation of the industry, but something quite different to it.

11,881. Are you aware that the United Gladbeck, the Bergmangluek and the Waltrop mines in Germany were estimated to make a profit in 1915 of £455,000, whereas they actually made a loss of £2,576,000?—I am interested to hear that. Might I ask what was the object with which they were run?

11,882. The object was to make profit?—Was that the object with which the Prussian Government owned mines?

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

11,883. I think so. They estimated that one of those three mines would make a profit at the end of that time, the others a slight loss?—I take it from you; but if you have studied the history of the Prussian coal mines you will know that the object was not in the least to make a profit out of the coal mining; it was in order to obtain for its direct consumption the coal which it required for its railway and other sources, and to protect itself against the higher prices charged by the private enterprise coal mines, and until you can ascertain what the complete balance sheet is I do not think you can say that the Prussian Government made a mistake or not.

11,884. Of course those coal mines were run under military discipline?—They were not; as a matter of fact they were run under a stringent autocratic system.

11,885. Very much approaching military discipline?—That is a vague term.

11,886. It is quite clear that those State-owned mines in Germany have not helped them to pay for the war?—They have helped them to carry on the war.

11,887. It has not helped them to pay for the war?—They have not paid for the war yet.

11,888. With regard to the form of nationalisation which you have been good enough to sketch out here, do you believe that it would satisfy the aspirations of the Miners' Federation of Great Britain?—I think you would probably find the Miners' Federation would decide that it was a great improvement on the existing system and they would give it a trial. That is only my speculation as to what might happen.

11,889. Do you think it would be possible to divorce the management of mines from political influence?—I do, if you mean under Liberal and Tory influence.

11,890. You told us this morning the Minister would have to be responsible to the House of Commons?—Yes.

11,891. How could he manage under political pressure?—It depends upon what you mean by political pressure, but I meant free from political influence; I meant free from Liberal and Tory influence. I think it would be possible to make the appointments in a very much more unbiased and disinterested way than appointments are made now, and make them really free from a political bias. I believe it would be possible to carry on the mining industry without any reference to Liberal or Tory politics, as it is certainly possible to carry on the Post Office in that way. I do not think anyone has ever suggested that the Post Office administration is influenced by political pressure in that narrow sense.

11,892. How can an official be free from political influence if his chief is liable to political pressure in the House of Commons?—I was a Civil Servant for some years, and my chief was liable to that in the House of Commons, but I do not know that it affected me.

11,893. You told us this morning that you were unable to get your own way?—Yes, that is the condition of things in working in a great machine. The individual is never able to get all his own way, and it is just the same way in railway administration.

11,894. If that is so, how could you manage to secure freedom from political influence?—I must say *solvitur ambulando*. It is done. I can only suggest it is an advantage that an individual should not get his own way, but it is an advantage that he should be able to make his opinion felt with other people, and reason has to prevail. It is much easier to govern, as has been said, in a state of siege; but it is not good government.

11,895. Why do you want to hand over the coal mines of this country to a political machine liable to pressure and in which people would answer for it in the House of Commons by getting information or figures, if you like, which you do not think as reliable as the Registrar-General's?—No one's figures can be so reliable as the Registrar-General's. If you ask me why I am in favour of the nationalisation of the coal industry, it is because the organisation of the

industry at present is extremely inefficient, in my opinion, and costly and wasteful, with bad social results. Unification has become imperatively necessary, and the only form of unification which I can imagine is national ownership. That is why I am in favour of national ownership.

11,896. I want to take you to the point in Sir Richard Redmayne's evidence. I think you will agree that referred to the same problem and not to the other heads which you attached to it?—Really my recollection of Sir Richard Redmayne's evidence is quite the contrary. As a matter of fact Sir Richard Redmayne, as it so happened, did not refer to any one of those points which the Coal Conservation Committee mentioned, unless they mentioned the reduction of colliery consumption, which I do not quite remember. Practically speaking, Sir Richard Redmayne did not refer to that in this connection when he said that "the present system of individual ownership of collieries is extravagant and wasteful . . . whether viewed from the point of view of the coal mining industry as a whole or from the national point of view, and I think by thoughtful persons on both sides, both the owners, and the workmen, that is pretty generally accepted." Then he went on to state the reasons, and not one of them referred to the conservation of coal.

Mr. Arthur Balfour: I should like Sir Richard Redmayne to be recalled and for him to be asked what he meant. It is a very important point and it covers a very large field.

Chairman: Yes.

Witness: May I read what he said? It is—

"(1) Prevention of competition, leading to better selling prices for exported coal being secured. (2) Control of freights. (3) Economy of administration. (4) Provision of capital, allowing of quicker and more extensive development of backward mines. (5) More advantageous purchase of minerals. (6) Reduction of colliery consumption. (7) More harmonious relations between the workmen and the operators, due to steadier work and adequate remuneration of workmen. (8) Obliteration to a great extent of vested interests and middlemen. (9) Unification of the best knowledge and skill, leading to greater interchange of ideas and comparison of methods. If good results are obtained at one mine and bad in another, these results would be open to all to benefit therefrom."

Those were the advantages which Sir Richard Redmayne ascribed to collective production. That would include, of course, any form of unification, and not necessarily nationalisation.

Mr. Arthur Balfour: Sir, I think I should like to have Sir Richard Redmayne recalled at some time. I think it is very important.

Chairman: Yes. Sir Richard Redmayne's evidence on this point is on page 215 of the Shorthand Notes.

11,897. *Mr. Arthur Balfour (to the Witness)*: With regard to the health of the miners, are you in favour of a Ministry of Health?—Yes.

11,898. Would it be his business to look after the miners' health?—That point was elaborately gone into by Lord Haldane's Machinery of Government Committee in this very connection. Lord Haldane's Machinery of Government Committee contemplated the nationalisation of the mines with remarkable prescience. The Committee had to go into the question of the ultimate overlapping which would exist between the Health Ministry and a number of other Ministries. That question was gone into, and it was decided that where an industry was nationalised (Lord Haldane's Committee was really reckoning ahead) and carried on by the Government, it would be imperative that that Department should have a Minister of its own for reasons which were there given, and in that case the overlapping question would have to be dealt with by some sort of machinery such as a joint committee between the subject Ministry and the industry Ministry.

11,899. Would there not be constant clashing in that case?—There must be always clashing of Ministries. You cannot get a division of functions

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

between Ministries which does not lead to overlapping cases, and the various Ministries were distributed by that report, including a Ministry of Mines, in order to get a minimum of overlapping and a maximum of co-ordination.

11,900. With regard to housing, how long is it since you were in a miner's house?—I think it is some years.

11,901. How many years?—I do not remember, but I do not think I have been in a miner's cottage for 10 years certainly.

11,902. Are you aware that private owners have built very large villages of excellent cottages within the last six or seven years?—I am aware of that.

11,903. And that they are fitted with bathrooms?—Ycs. May I say I have not given any evidence as to the character of housing from my own knowledge or about housing at all, but I have only dealt with the facts as put in? I have not even said that the housing was bad.

11,904. Then you agree that the private owner has built a large number of very satisfactory houses?—I should not agree with that—the adverbs are not carefully selected. It is not a very large number of houses in relation to the need of the whole industry. Some private owners have built some decent cottages.

11,905. I have seen a very large number. Have you seen a large number?—No, and I will not contradict you, but I suggest that the adjective must be used in relation to the total. A very large number might be a thousand. If I saw a thousand, I should say it is a very large number, but it is nothing at all in comparison with the million.

11,906. I think if you will take the trouble to look at some of the villages, you will see that it is a large number?—Well, I am very glad to hear it.

11,907. On page 3 of your proof you state that you would be afraid that "a single monopolist concern, having tentacles in every constituency in the Kingdom" would be "far too powerful a leviathan to drag with a hook by the Home Office." You do not object then to tremendous trade unions with equal power, apparently?—I do not object at all, but I think that you have to take the steps necessary to prevent any one trade union being able to use its powers in a way detrimental to the public interest, and one of the ways to do that is to nationalise the industry.

11,908. And you would say the same thing of combinations of trade unions?—Yes.

11,909. How would you go about the necessary control?—As I say, generally the first step is to nationalise the industry. The Government, with the public behind it, is much more powerful than the employers.

11,910. Do you really believe that strikes would be less frequent if you nationalised the industry?—Yes. As I explained, a large proportion and perhaps a large number of strikes occur from all sorts of causes which ought not to happen, and which I do not think would happen in a public service.

11,911. Taking the war period, we have had some little experience of Government control of industry, and are you aware that the number of strikes which have taken place in the whole period have been almost entirely against the Government?—I do not think so. I think the large majority of the strikes in the war period have been against private employers. There have been very few strikes in Government establishments.

11,912. But the strikes which have taken place in private establishments have been against Government decisions and not against the employers?—I cannot understand that.

11,913. Do you agree to that?—No, I think the strike is against the private employer. It may be sometimes because the private employer has not carried out the decisions of the Government.

11,914. Are you aware that those strikes have been very largely due to delay in Government decisions?—That is one way of putting it. I have heard it put that they have been very largely due to delay in carrying out the decisions.

11,915. Are you aware that what you refer to as delay in carrying out the decisions has been due to

the Government having an imperfect understanding with regard to making orders which could not be carried out?—That is what the employers said.

11,916. Has not that been proved by enquiry made afterwards?—That I am not aware of.

11,917. Now, may I take you to the question of the continuous running of the pits?—Yes.

11,918. You said that you would get over the bad depressions of trade by stocking coal?—Yes, temporary depressions and slight depressions.

11,919. Wherever that stocking might take place is not material to the argument?—No, that is so.

11,920. That would mean stocking perhaps 10 per cent. of the output?—I do not know quite; I do not think so.

11,921. If you take the average output in a good year and a bad year, it is about 10 per cent.?—I do not think it is as much as that. I explained that you must make a distinction between small, local and temporary depressions which are by far the most numerous in number, and it is large cyclical depressions which have been in periods of 5 and 10 years. The small temporary and local depressions can be got over by the use of short-term stocking. On the other hand, the large cyclical general variations of production can be much more easily met by varying the number of people taken into the industry and by attention being paid to recruiting for the industry. If you provide for the facts as regards all the little depressions, you can provide for any variation of considerable magnitude by varying the rate of recruiting for the industry.

11,922. In other words, you would attempt to deal with the large depressions of trade by stocking on a large scale?—No, I said not. You would vary the rate at which you took people into the industry.

11,923. Of course you appreciate the loss on the coal stocked would be at least 10 per cent.?—I do not know how you reckon the loss. There would be a loss of interest.

11,924. By waste, and so on?—On that there is a certain diversity of opinion. The loss is very different on some coal from what it is on others.

11,925. If you were trying to operate a pit, you would have to operate it whether the coal was good for stocking or bad?—Yes, you would work each pit continuously.

11,926. Through the extent of that waste you would increase the overhead cost of coal throughout the country?—Yes, to the extent of any waste for that; but remember, in return for that you would have other improved conditions. You would have first of all the security which the stocks provided you with against any interruption of supply, which is very material, although you cannot put a money value upon it. Secondly, you would have a great saving in the cost of running which is involved in absolute continuity of production. Thirdly, you would have another thing which is not comparable in terms of money, and that is the very justifiable security to the colliery workers of their daily dinner: that would be secured to them, and their livelihood would not be interrupted by breaches of continuity.

11,927. To the extent to which you restricted the output by taking on less men or increased the stock, you would increase the cost by an increase in standing charges?—Yes, but you have to take into account the other factors by which you diminish the cost. I am not prepared to say that the net result would be an increase in the cost.

11,928. How could it be anything else?—No one could possibly state at this moment what would be the balancing effect of these two considerations. I have been asked this morning about collieries which only work three days a week. What is the cost of the collieries which work three days a week?—It must be considerably in excess of those which work six days a week. If you can avoid all that loss you have a considerable surplus to set off against any loss by stocking.

11,929. To avoid that loss you have to alter the human nature of the miner and persuade him to work six days a week?—No. I am not talking about that. It is the useless discontinuity which is not due to anything in the miner. I am not talking about absenteeism in collieries which only work three days a week. I do not want to run off into a defence of

29 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

the miner. What we are talking about is the defective management.

11,930. One of the best ways to increase production and also to pay higher wages would be to work full time, would it not?—That is what I am asserting. You cannot secure absolute continuity of working full time under an individual system of ownership of the collieries. It has been stated on behalf of the colliery owners time after time that in no possible way could you, under their system of individual ownership, prevent temporary interruption of working from one cause or another.

11,931. Apparently you can do that under nationalisation because you provide for stocking and restriction of output?—I have not mentioned restriction of output, and I do not propose that in any sense whatever. May I state that I propose that every colliery in State employment should work with absolute continuity unless there is a breakdown of machinery, which I should hope would not happen. I should say any Minister of Mines would deserve to be dismissed summarily if he were so culpable as not to arrange for his mines to work continuously. There is no difficulty in any unified system working the mines continuously, but it is impossible under individual management of the coal mines. It is quite easy under unified management. If you ask me how I do that, I point out at once that you do not work in order to keep pace with a constantly varying demand, but you work to a fixed demand which is in excess of that varying demand in order to provide for the building up of stocks. If you ask me whether I apply that to the great cyclical variations, I say no: those would be met, not by restriction of output in the sense of attempting to limit the output, but by restriction of recruiting to the number of men in the mine to produce the supply which is required.

(The Witness withdrew.)

Chairman: Gentlemen, I think it will be convenient, subject to your convenience, to give Mr. Sidney Webb a rest, and to take two witnesses who have to return to Glasgow and elsewhere. These are witnesses of the economist class, and we have heard a good many of them. Unless some gentleman

11,932. If the mine is laid out to produce a certain output, you would restrict the number of men?—No; I would restrict the number of recruits. I am not in favour of taking on more State officials—as these men would be—than there is work for them to do.

11,933. You would restrict the prospective persons in training for the mines?—Certainly. You would not take into the coal mines at a time when the production was greatly reduced quite so many of the boys who would go into the coal mines if the production were increasing year by year. But that happens now. The private owner does not take new men into his service when his production is decreasing. I am only proposing that what is now done unsystematically, and without knowledge of each other's requirements, should be done systematically in the light of statistics.

11,934. Do you believe nationalised coal mines at the end of 5 years would make or lose money?—I think the object of a national industry is not to make or lose money. The object of a nationalised coal industry is to supply coal, and supply it as required in the best possible way and at as little cost as possible, but it would not be the object of a nationalised industry to make money in the ordinary sense. I think what we have to do is to carry our minds from the notion of making money to the notion of performing public service, and let every one in the kingdom have the coal he wants when he wants it.

11,935. You would run it as a national coal charity?—No; I would not run it as a national coal charity. I think the Chancellor of the Exchequer would get a nice little return out of it as he does out of the Post Office, but the Post Office is not run for profits.

has a particular question to ask, it might be advisable to read their proofs and pay great attention to them, but not to have a cross-examination at too great a length.

First of all, I will call Mr. Graham Wallas.

MR. GRAHAM WALLAS, Sworn and Examined.

11,936. Chairman: I will read your proof, which is as follows:—

"I am Professor of Political Science in the University of London, and was a member of the MacDonnell Commission on the Civil Service (1912-1915). I am not a professed economist, but am familiar with some of the political and administrative arguments for and against "Nationalisation." Many of the arguments which I have heard used against nationalisation seem to me to involve a confusion between the results of large-scale organisation and those of nationalisation. The village carrier is impelled to be efficient by different motives from those which impel the State parcel-postman. But much, if not most, of that difference would also be found if one compared him with the man who delivers parcels for a large privately-owned railway company; or if one compared a village shopkeeper with one of the employees of a multiple-shop company, or of the Co-operative Wholesale Society.

Nearly all students are, I believe, agreed that the advantages of large-scale organisation of some kind outweigh its disadvantages in the case of railway service; and some students believe that the balance of advantage is on the same side in the case of the distribution of food in urban areas. I myself believe, though I have no expert knowledge of the technical facts, that large-scale organisation of some kind is an advantage in British coal-getting.

If so, the question is narrowed down to a comparison between nationalisation and other forms of large-scale organisation. Apparently, in the course of the discussion it is being further narrowed to a

comparison between the nationalisation and large-scale private administration with a considerable degree of State control. I shall myself consider the problem of nationalisation neither as an industrial nor as a technical, but as an administrative problem.

It is proposed that the State should become responsible for the appointment, discipline, promotion and control of perhaps twelve hundred thousand persons, men, boys, women and girls, ranging from the managers of great systems of pits down to pit-boys and girl typists. My own opinion is that this will be an advantage to the community if the State takes reasonable care in avoiding certain administrative dangers, and that it will be a disadvantage to the community if such care is not taken.

The most obvious administrative dangers may be summed up as follows:—

- (a) The coal-mining service might become corrupt in the ordinary sense. Posts might be sold by those who had the power to fill them, as posts in the British Civil Service were sold in the seventeenth and eighteenth centuries.
- (b) The service might get, in the American sense, "into politics." Posts and promotion would be given as a reward for political work or political subscriptions; and those who opposed the party which for the moment dominated either Parliament or the district concerned might be passed over or dismissed, or refused work.
- (c) The service might become, as some of the fifteenth and sixteenth century guilds became, a "family affair." Officials

29 April, 1919.]

MR. GRAHAM WALLAS.

[Continued.]

and workmen might acquire a customary right to appoint or admit to employment their sons or other relatives. Outsiders might only be admitted to work for which there were few applications, and superior and inferior hereditary grades would be thus created.

(d) Or all or some of these evils might develop sporadically and partially.

I should suppose that instances of all these evils might be found in the existing private administration of the industry. Any improvement in the conditions of the service which made admission to it more desirable than admission to other forms of employment would, of course, increase the danger, whether the industry were publicly or privately owned.

In approaching similar problems in the Civil Service, the Royal Commissions which have enquired into them (of which the Playfair, Ridley and MacDonnell Commissions have been the most important) have separated the forms of service into (i) administrative and clerical, (ii) technical, and (iii) manual.

The most elaborate system that has been built up in the British Civil Service is that providing for admission to and promotion in clerical and administrative work. The basis for this system is admission by open competitive examination in the subjects of a general education. It is believed that a properly educated young man or woman can be trained after appointment to do the administrative work even of such a technical department as the War Office or the Admiralty. The higher posts in this work are therefore normally given to those who have been trained in it. If this system is used to any extent in the mining service it would probably be well to require a certain knowledge of natural science in the examination, even from the future clerks and secretaries of the service. The present distinction between "Class I" appointments and those of a lower grade might be modified; and promotion might mainly depend rather on proved efficiency than on the examination by which the original appointment was made. Perhaps it would be well to hold the examinations not in London, but in the coal districts; so that the mass of the candidates, especially for the minor clerical posts, would normally come from those districts, and be familiar with their conditions.

The appointment of technical officers under the State, such as Government chemists, or engineers, or lawyers, or doctors, has hitherto been somewhat haphazard. The Playfair and Ridley Commissions practically ignored this problem. The MacDonnell Commission recommended that in the appointment of young men and women for technical posts reliance should mainly be placed on competitive examination in technical subjects, and that in the appointment of older persons to posts for which they might be expected to have been trained outside the service, all posts should be advertised and applications should be considered by technical committees of selection containing at least one representative of the Civil Service Commission. Since the technical work of coal mining is highly specialised, it would probably be found that the best men for the higher technical posts would be selected from those trained from youth in the service. If so, it will be necessary to provide carefully against "regionalism" in promotion. A brilliant young mining engineer should be able to look forward to the chance of appointment to an important post outside his own district. Care should also be taken that women shall be eligible for all work for which their powers are suited. I believe, for instance, that some of the best living "fossil botanists" are women.

The British State has hitherto given very little general attention to the problem of the best way of appointing, promoting and dismissing manual workers outside the Army, Navy and postal service. I do not know, for instance, that there exists in print any description of the actual forces which influence the appointment or refusal to appoint applicants for manual work in the State dockyards.

Appointment and promotion of manual workers to a service so large and complex as the coal-mining industry would be a comparatively new problem. It should be carefully enquired into as soon as nationalisation is decided on, and continuously watched during the development of the new system. The existing miners would, of course, be taken over by the State, and any system of filling new vacancies and making new appointments should probably be decentralised, and perhaps made to conform, as far as can be done without loss of efficiency, to the best local traditions.

The evidence given before the various Commissions on the Civil Service and my own administrative experience, both on the London School Board and on the London County Council, suggest to me that it would be well for the State, in taking over so large a new service, to consider carefully the right way of dealing with those cases of slackness and inefficiency (both on the administrative and on the technical side) which do not amount to gross misconduct. This problem also exists, of course, in large-scale private industry.

If the mines are nationalised, and particularly if examination is to be used to any considerable extent as a means of recruiting, it will be found that the problem of employment is closely bound up with that of the technical and general educational systems of the mining districts. Those who are engaged in the organisation of technical education and research should be brought into close contact with the whole system. A young engineer or chemist, for instance, whom it is proposed to promote to a higher grade of work, might well be given a short leave of absence, together with opportunities of research, either in Britain or in America, under the general direction of a high technical expert.

All these administrative problems would exist, and would have to be solved, whether the form of nationalisation adopted were administration by an ordinary Government Department or such a scheme of joint Governmental and vocational control as that proposed by Mr. Straker in his evidence.

An essential difference between coal-getting and other industries consists in the fact that the existing coal deposits when once exhausted cannot be renewed; so that each generation of the inhabitation of Great Britain has to decide how far it will prefer the interests of its successors to its own interest. In this all-important respect I believe that nationalisation would have an advantage over private ownership. The same man will, I believe, when he is acting as a voter or Member of Parliament, or Minister, or State official be more influenced by national interests in distant future than when he is acting as a shareholder, or manager, or member of a trade union."

11,937. *Mr. Sidney Webb*: I will only ask you a few questions, as your proof is very clear. You lay the main stress on the method by which the staff is obtained and promoted. That is the most important thing, is it not?—Yes.

11,938. And you point out that there is a danger in all State enterprise that the service might get either corrupt or be influenced by politics?—Yes.

11,939. But I gather that you do not suggest that that has been typical of modern British administration and that it has, to some extent, avoided those dangers?—When I was concerned in the administration of London education I saw the reality of some of the dangers. I was, for my first three years on the London School Board, the Whip of my party, and the Whip of a party sees the motives of everyone concerned, perhaps, in their most naked simplicity. I became then, for seven years, Chairman of the School Management Committee. We were dealing then with the problem which in some ways would be very like this of the miner; that is to say, we had a very large service—the County Council has, I suppose, about thirty or forty thousand teachers—nearly all of whom belonged to a great national organisation, the National Union of Teachers, with a very powerful electoral influence—and undoubtedly there was a period for some years before the County Council took

29 April, 1919.]

MR. GRAHAM WALLAS.

[Continued.]

over the work in which it was extremely difficult to avoid a real scandal in that respect, and where an ambitious assistant teacher might naturally hope for promotion if he interested himself in electioneering and the election of a prominent leader of the body. That evil came to an end, so far as I was able to observe when the County Council took over the work, because the County Council took certain precautions which were not taken at the School Board. It also came to an end because the County Council, I think, represented a larger interest, having financial and administrative interests not merely in one thing, and because it had definitely to feel that it was concerned with the raising of money, as well as with the saving of it. I did feel at that time that it was a very difficult problem, requiring constant forethought and constant observation to prevent evils of that sort appearing even under modern English conditions.

11,940. At any rate, you think it was successfully coped with in that instance, and could be successfully coped with on the lines you suggest?—Yes.

11,941. Moreover, I think you indicate, do you not, that analogous things happen in private enterprise?—I believe in America, where I have spent part of my time, the most scandalous instances of big organisations being in politics are very often cases where the organisations are under purely private ownership. The Boston and Maine Railroad, which corrupted the politics for ten years at least of three of the New England States, was all that time purely private. The Pennsylvania Railroad, whose best friends would not defend all its actions, was under private ownership. As soon as you get a highly organised body dealing with matters of high concern, in non-political ownership, it is used for political purposes.

11,942. Applying that to the alternative of a National Coal Trust, what do you think of the possible inconvenience of a National Coal Trust in this country?—I should have thought a coal trust over large parts of England might very easily, and very probably would, have the same sort of influence that The Pennsylvania Railroad Company had over Pennsylvania, or the Boston and Maine Railroad Company had over the politics of New Hampshire: that is to say, it and its officials would feel themselves forced. They would say they owed it to themselves to defend themselves against attack; they would feel forced to go into politics, and would be a source of corruption by their power of patronage in particular.

11,943. I suppose with regard to the particular means you suggest to be taken with regard to State employment, it would be hardly possible to enforce that with a national trust?—I should have thought, unless the national trust meant national administration, with only the name of a trust, it would be impossible to enforce what the Americans call civil service principles upon the day to day appointments and promotions of such bodies.

11,944. *Sir Allan Smith*: You condemn the American system?—I have stated certain evils which appear, so far as my experience goes, in certain large American public utility corporations.

11,945. And you expect us to avoid those evils?—Yes.

11,946. Are those evils due to any extent to the fact that public officials change with each government?—I think the particular evil I was thinking of, namely a large privately-owned and highly concentrated body dealing with a vital public utility and defending itself against legislation or administrative interference by interfering in politics, does not seem to me to be necessarily concerned with the change in the spoils system.

11,947. What is the spoils system?—That is the system by which, on a change of administration, the whole body of the civil servants in America used to go out of office, and other parties come in. That, as you know, has almost come to an end. With regard to the mass of public officials in America at this moment, the spoils system is very much restricted now.

11,948. Do you think there is any chance of any arrangement of that description, namely, the political power on industrial concerns in this country?—I should have thought that it was one of the great

threatening dangers. Take one industrial concern which is concerned with the sale of alcohol. I should have thought it was rather notorious that that particular industrial concern or set of concerns has felt itself bound to undertake large political activities.

11,949. You mean that it conducts a campaign through its members in Parliament?—And it employs its own officials and representatives in the districts for the purpose of strengthening its political position.

11,950. Then do you think any combination which conducts political activities is to be condemned?—I think all combinations are bound to do it, but I think the State under those circumstances is bound to take precautions against the corruption which might result from such activities.

11,951. What sort of corruption do you think would result from the political activities of the trade unions or Labour Party?—I think it is quite possible that if it was found that the right way to get into a pit, or the right way to get a check-weighmanship, or a clerkship, or one advantage or another at the pit, was to show yourself very active for the Labour party, that would in the end produce an undesirable state of things—both inefficient appointments and a corruption of politics. I think care ought to be taken that some other influence than the recommendation of the local Labour party agent should be brought to bear in the recruiting of the men.

11,952. Under nationalisation would you suggest, not only combinations of employers or capitalists, or whatever you like to call them, but also combinations of workpeople should be excluded, and men should be dealt with on their actual merits?—Again you are using large words. I am confining myself to the question of recruiting and promotion in the service, and I think, so far as possible, it ought to be avoided that in recruiting or promotion you depend upon the political activities either of employers or of workmen.

11,953. Or of membership of an association (say a capitalist association) or membership of a trade union (say a Labour party)?—Certainly, membership of a Labour party which would influence promotion would be disastrous.

11,954. Are you satisfied nationalisation is a desirable experiment?—I agree, if I may say so respectfully, with the statement in the Chairman's report, that the existing system may be held to have broken down. I think it has failed to produce industrial peace or the effective and economical production of coal.

11,955. May I interrupt you to point out a fact? The Chairman's report said, "even upon the evidence already given." Do you think it is possible that the evidence still to be given before the Commission may induce the Chairman to alter his opinion as to the present system of ownership and working in the coal industry?—That may be. I may have an opportunity of reading it, and I may be converted.

11,956. You take the Chairman as coming to that conclusion, and he states "even upon the evidence already given"?—That is so.

11,957. Going on your own ideas and your own convictions, and leaving the Chairman and his report alone, I ask you again, are you satisfied that it is a wise thing to enter into such an extraordinary experiment as nationalising the coal industry in this country?—That is my opinion.

11,958. Which?—That it is wise for us to do so.

11,959. Upon what do you ground your opinion?—I ground my opinion on my knowledge, on the one hand, of the present state of things, gathered from the evidence so far as I have been able to read it now, and other considerations within the last forty years, and from attempts to ascertain the facts from anything—

11,960. Let us have it bit by bit. Take the present state of things: What is the present state of things upon which you ground your opinion?—The fact that the Chairman's report has made that statement.

11,961. Then you are taking his words and not your own conviction?—No, my own conviction is based in part upon my reliance upon the Chairman; but at the same time, in so far as I have been able to read the evidence, and so far as I have, going about the industrial parts of England, been able to observe

29 April, 1919.]

MR. GRAHAM WALLAS.

[Continued.]

the facts, I have come to the same conclusion.

11,962. In coming to that conclusion have you been moved at all by the reference to the various points of argument, namely, housing, infantile mortality, prevention of accidents and diseases—have you been influenced by these points?—If I may say so, I have been influenced by my feeling that a nationalised industry can dovetail itself more conveniently with the other national activities than an industry on a very large scale in private hands. Mr. Harold Cox told us that he wanted to sell the London schools for what they would fetch and start with private adventure London schools. If all the London schools were private adventure schools, I myself think they would be worse schools, and they would be also more difficult to use for the purpose of national and London health and recreation and other purposes.

(The Witness withdrew.)

MR. J. H. JONES, Sworn and Examined.

11,966. *Chairman*: I believe you are Lecturer in Social Economics at Glasgow University?—Yes.

Chairman: The Secretary will read certain portions of the witness's proof, and Mr. Tawney and Mr. Balfour will ask questions.

Secretary:

“ SUGGESTIONS.

Suggestions for Reorganisation.

It follows from what has already been stated that, if it were practicable, experiment along different lines would be desirable. It is suggested that experiments of different kinds are practicable. There are several distinct coalfields, differing in geological features and perhaps in economic characteristics. These areas or fields may be kept separate for purposes of experiment, for, although they are in indirect competition (and sometimes direct), and the differences in the properties of the coals in different areas result in inter-area trade (e.g., anthracite coal may be sent from South Wales to the North; South Yorkshire coke appears to be used in some Staffordshire blast furnaces in preference to that supplied at lower prices from local ovens), they may be regarded substantially as economic entities.

The coal industry is clearly divided into two parts, mining and distribution.

Nationalisation for Scotland.

(a) *Mining*.—Nationalisation has not hitherto been defended in this memorandum. But it has never been tested, and it should be given a fair trial. It is suggested that the Scottish industry should be nationalised. The Scottish coalfield is not only remote from the others, it also seems to be fairly representative in the sense that it contains old and costly mines as well as new and prosperous ones, and many seams yet to be opened. The export trade is fairly important and relatively simple. The housing problem is more acute here than elsewhere, and will need special consideration. For the house-building industry in exclusively mining communities is regarded as highly speculative on account of the precariousness of the life of a mine.

Cartel or Joint Board for South Wales.

The South Wales field lies at the other extremity, and, for technical reasons, presents a more difficult problem. It should be controlled by a Cartel or Mining Board. A cartel is to be preferred to a trust, in that the fate of the industry would not then depend upon a few heads or directors.

The Cartel should be a Joint Board, upon which equal representation would be given to employers, workpeople, consumers and the State (which would also be the chief consumer). Its function would be to purchase the coal from the mine owners, and sell it to the consumers. The purchase price would be quoted “free on truck,” and vary only according to quality.

Deviations from the Quota price.

The difference between the purchase price and sale price (free on truck) would represent expenses of

11,963. Would you apply your mind to housing?—Yes. I say I think it would be more possible under nationalisation to dovetail the industry of getting coal with the industry of making good houses than under the system of private ownership.

11,964. Do you think the provision of good houses ought to be a national burden?—I think it ought to be a national object.

11,965. A national burden?—The question whether the London trams are a London burden is a question of finance. They do not cost anything, but finance is a matter of anxious consideration, and it may well be either that houses would be provided under circumstances which would not appear in the annual budget as a charge; or, on the other hand, that they might appear as a charge in the annual budget.

management plus a contribution towards a special compensation fund. The Board would distribute orders to the mine owners, the individual quota being determined at first by the producing capacity of the mine; but the owner would be permitted to supply additional quantities at prices below the fixed or standard price, the excess to be permitted varying with the extent of the reduction in price—thus x tons at $a/-$ per ton reduction, $(x+y)$ tons at $(a+b)/-$ per ton reduction, and so on. Stocks would thus be accumulated. Under normal conditions the subsequent quota of the mine would be increased pro rata, and the standard price adjusted. This would prevent owners from “dumping” during depression, for the subsequent regulated uniform or standard price would be affected thereby. Yet each firm would quote as much as possible below the standard price in order to retain its quota. The position of the individual mine owner would be (to use a technical phrase) similar to that of a monopolistic combination producing manufactured goods, the demand for which is highly elastic—which is a consummation to be desired.

Determination of the Quota Price.

The standard price would be determined at first substantially by the conditions prevailing in relatively poor mines—to be more precise (for it is a vital point) by the average cost of mining, say, that half of the total supply which is most costly to produce. (The traction is purely illustrative.) But the quota of the richer mines would gradually increase, and the standard price gradually fall (see last paragraph).

Effects of the Scheme.

There would therefore be needed a subsidy for the poorer mines, drawn from the profits of the Board. The subsidy would be pro rata with output, not producing capacity, and there would probably be reached in some cases a point at which a reduction in price, plus fair compensation for closing down a mine, would be better than the maintenance of the standard price. This would be in line with the present custom of scrapping machinery in manufacturing industries. The scheme would avoid the danger of a reduction in wages rates; it would prevent the sudden closing down of mines, allow workmen time to adjust themselves to new conditions, and preserve mines in existence as long as socially desirable; it would provide compensation to the owners where necessary; it would preserve initiative and stimulate enterprise, and considerably reduce the increment in profits due to geographic conditions and prevent that due to trade booms; it would stabilise prices (free on truck) and eliminate the speculative element, while securing a gradual downward tendency in relative prices. Mineowners, with a fairly assured market (yet one susceptible of relative growth) would concentrate upon industrial management, success in which would determine whether or not there would be growth. The Board would institute and maintain a Research and Commercial Institute, and the results would be available to all.

29 April, 1919.]

MR. J. H. JONES.

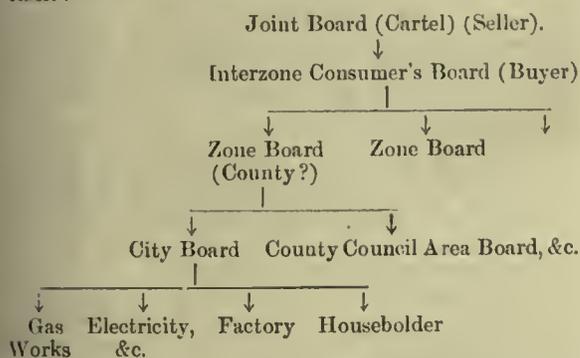

[Continued.]

Control by Workers.

The workmen's Union or Federation for the area would be represented on the Board. But further control is needed. The strength of the workers' claim to share in control is determined by their power to provide service, now and in the future. There is no question of "abstract right" involved. Not only should pithead committees be extended and strengthened, but it seems to me very desirable that a workers' delegate should be appointed as member of the Board of Directors. There are objections to this policy, even when the commercial function has been so largely taken over by the area Board; but they do not appear to outweigh the argument in favour of experiment along this line. Moreover, every workers' committee should be regarded as entitled to all the information now supplied to the shareholders. Under the above conditions there would appear to be no serious objection to profit-sharing—for wages would no longer fluctuate with the state of trade, as they do even at present, when prices are regarded as a test of profits.

(b) *Distribution.*—The export trade should be left in the hands of the Joint Board. Prices should be left to the higgling of the world market, but one-half of the excess of export price (free on truck) over home standard price (plus expenses incurred in the export trade) should be paid to the State, the other half being allowed to accumulate, as sinking fund, to assist in stabilising export trade during periods of depression.

Time will not permit a description of the scheme for distribution, but the following diagram explains itself:—

The "zones" represent the central feature—within each zone there should be a zone price to the various authorities (local and county) being the standard price (free in truck), and average freight to the zone. The local authorities could safely sell to retail dealers. The main object would be achieved, namely, to obviate danger of price associations between the retail dealer and the mine owner. Whether, apart from railway economies, there would be any considerable saving, is extremely doubtful.

Joint Control.

Reference has already been made to the system of joint control. In examining this system it is necessary to distinguish between private and State enterprise.

Private Enterprise.

In private enterprises there are at least five distinct forms of control which may be exercised by the workpeople. The first is that involved in the system known as "collective contract," first advocated by a small group of engineering workmen on the Clyde. Under this system the firm would supply buildings, machinery and materials, and the workers, through their committee, would undertake full responsibility for making the product, such as a marine engine, at a contract price. The term "worker" would cover all grades, from the manager to those who "fetch and carry." The internal management would be entirely in the hands of the committee, working, presumably, through existing managers and superintendents. The functions of the directors would be almost entirely commercial. Other considerations

apart, it is clear that the workers in the establishment would need to form themselves into an association able and willing to accept legal responsibilities, and that this fact alone places the system beyond the range of practical politics.

In the second form of joint control the shareholders and workpeople are regarded as two groups which should enter into partnership on equal terms. They would constitute a new type of firm, and enjoy equal representation upon the board of directors. But the directors are representatives appointed by the constituents to conduct the enterprise and to enter into legally enforceable contracts and take all the risks necessary to conduct that enterprise in an efficient manner. It will be generally agreed that ultimate control and responsibility are inseparable. The two parties would therefore require to accept joint legal responsibility and jointly to undertake risks. Such a scheme of joint control and responsibility would further necessitate an agreement, one clause of which would require to state that a given standard rate of wages was equivalent to a given standard rate of interest and to specify such standards; and that any variation in the excess profits (or in the deficit) would be divisible between the parties in a manner therein prescribed. Given an agreement of this character, the subsequent interests of the two parties would be more nearly parallel than they are at present. But there is no indication that such an agreement could be reached in the near future, partly because the workpeople would not undertake the legal responsibility already specified.

The third form of joint control is that already exercised over conditions of employment through Conciliation Boards and the machinery for applying the terms of general agreements to local conditions. The fourth is that proposed by the Whitley Committee. The fifth and last is the one adopted in the Cartel scheme suggested in this memorandum. It represents a compromise; but a compromise seems inevitable so long as the workpeople are not prepared jointly to undertake those legal obligations involved in contract.

State Enterprise.

As regards public enterprise, the State may either exercise supreme control, through a Minister, or set up some form of joint control on the lines suggested by Mr. Straker. Dual control is unsound in principle and would break down in practice. The first method is the only method which a democratic Government could employ. The functions of the workers' representatives must be either of an advisory character or, at most, administrative functions delegated by the Minister, by whom, moreover, they could be withdrawn."

11,967. *Mr. R. H. Tawney:* I think you make two main proposals. The first is the nationalisation of a single coalfield, the Scottish coalfield, and the second, State control. I understand you have no rooted objection to nationalisation, but you would like to see it tried first by way of experiment?—I have no prejudice against it.

11,968. You do not think it is an impracticable thing; you actually propose its application?—Apart from my own view, I think the position is prejudiced by the report of the Chairman, and it is a question of an alternative to the existing system, not whether or not I agree with the existing system.

11,969. You have recommended, not one alternative system, but one of two. You proposed nationalisation in one coalfield?—Yes.

11,970. You do not think it is the proposal of a mere theorist, but something that can be tried?—Yes, you can try experiments of all kinds.

11,971. Have you selected Scotland because of its special virtues?—Because I happen to live there!

11,972. Your second proposal, which you deal with at greater length, is the question of the Cartel or Joint Board. That is rather like the Westphalian Cartel, a sales agency?—At first sight it appears like the German Cartel system; to my mind it is the negation of it. The whole purpose of a Cartel system is to prevent any excess output. The purpose of mine

29 April, 1919.]

MR. J. H. JONES.

[Continued.]

is to prevent profiteering in the wider sense of the term and encourage excess outputs from those mines which are in the best position to provide such excesses.

11,973. About profiteering, I suppose you mean the danger of excessive prices and so on?—Yes.

11,974. Excuse me, if I ask a question which you have answered in your paper. Do I understand the customers are represented on the Cartel?—Yes.

11,975. Have you read the report of the Coal Conservation Committee?—Yes, I read it when it appeared.

11,976. You remember they point out various technical economies which would be possible with greater unification, or the removal of various defects, at any rate; for example, the waste of barrier coal and the lack of centralised pumping, and so on. Is it not one of the defects of a selling combination that you cannot get those economies of real unification?—There is a good deal to be said about the supposed economies of unification. May I take, for example, those nine points which Sir Richard Redmayne put forward before the Commission. The first so-called economy of unification is the fact that a combination would be able to extort very much higher prices in the foreign market than at present. That does not appear to be relevant to the question of economies of management under a unified system.

11,977. It is a separate economy?—I do not regard that as an economy at all.

11,978. It is an advantage which your Cartel would possess?—I think it is a question that is very likely to arise—and, personally, I would not like to see it—to exploit foreign countries more effectually than at present.

11,979. It would?—It might or might not.

11,980. It might exercise its power or not; in fact, it would possess the power?—The power is determined more by foreign competition than by individual competition at home.

11,981. I suggest to you the point to go upon is the unity of selling which would strengthen the collieries' position in the market. I began by asking you with regard to the first economies mentioned by Sir Richard Redmayne, which stand on a different level; there are others which are only realisable under unification?—Another referred to is the railways, which has nothing to do with coal-mining. The third was the provision of capital out of profits obtained from the export trade under new conditions. Three of the nine seem irrelevant to the question of the advantages to be derived from unification with regard to mining.

11,982. I accept that without admitting it. There are certain important economies that are only obtainable by unification?—I am not competent to judge the extent of those economies. I would suggest that the coal industry appears to an outsider to be in an entirely different position from the iron and steel trades. If you had a cartel in the iron and steel trades, there would be a possibility of manufacturing co-operation, which does not appear in the coal trade. I mean this: in the steel trade you have at the present time a worker producing to-day rods, to-morrow hoops, the third day bars, the next day sections, and so on, and many possible economies are lost on account of individual operations of that character, and a scheme of unification would effect many economies along those lines; but it seems to me that that consideration does not apply to anything like the same extent in the coal industry as in manufacturing industry.

11,983. You are alluding to the economies of standardisation?—Yes.

11,984. That is only one economy. I do not press this point if you have not considered it. A great volume of evidence has been given, and Sir Richard Redmayne is not the only one who has said this, and I refer you to the report of the Coal Conservation Committee that these are economies that can only be obtained under unification. What I want to know is whether mere unification with regard to selling alone would enable you to realise the other economies?—I think it would enable the districts to realise some of them, because all the energies of the people would be concentrated upon management. At the present time a man makes a profit

very often on the commercial side of the business. I have not very much experience of business, but the impression I have gathered from what I have seen is that the top people in a large firm are much more concerned with the foreign policy, if you like, of the business than they are with internal administration. I think that if you could commandeer all that energy, which you would do under a scheme of unification, you would go a long way to effecting the economies which complete centralisation of control would itself effect.

11,985. I do not dispute your statement that each man should attend to his job. It would not touch the question of the waste in unnecessary barrier-coal between the separate properties?—No.

11,986. Nor the waste of flooding the pits through not having centralised pumping, and so on. There are other technical economies of that kind which only unification can deal with. I do not deny the value of your scheme so far as it goes, but I suggest it does not go very far?—I am not sure. You have to consider the economy that would be effected by centralisation of control, but also the things you would lose by a form of unification which did not centralise control.

11,987. You say you must consider the things you would lose by a form of unification which did not centralise control. But there are some things you lose by non-centralised control?—I think you refer to the economies which are obtainable by the complete centralisation of control such as you have under a nationalised system. You have certain economies to which you have referred. On the other hand, you lose certain other economies which might be obtainable under a system of unification, but decentralised control. It is a question of balancing the two things. I would not say that centralised control is better than a scheme of unification which allowed full play with regard to initiative and enterprise.

11,988. Your scheme is a compromise?—Yes.

11,989. Does this system of centralisation allow you to realise certain of the social advantages offered by unification would it allow you to deal with bad housing and accidents? Each mine is to be left very much to manage itself as it likes, and you are merely to combine for selling purposes?—Yes.

11,990. Would it enable pressure to be brought on individual mine owners to level up the standard with regard to accidents and so on?—That question raises a very large point. If you take the whole industry by itself the reply is in the negative. If you take industry as a whole I think you have to assume there are certain functions such as factory inspection which require a separate Government Department, and it is a very moot point whether you do very much by taking the inspection of mining away from factory inspection altogether.

11,991. I am not sure that I follow you?—Suppose you nationalise the coal industry to-day, to-morrow the steel industry, and the third day the cotton industry and set up departments for the special industries. Each one would have a factory law of its own to administer. Then would arise the question in Parliament very quickly, whether or not it would be worth while taking these centralised administrative functions and group them together, and you might have in the end a new department of factory inspection such as you have at present.

11,992. That hypothesis is one of your own. I did not suggest that. I suggest under proper management of the coal mine you would not get the perpetual collision between the financial interest of the mine owner and the interest of the nation in preserving the lives of its members which you have now?—I fully agree.

11,993. To that extent it is a gain which is so great as to be incalculable. We are killing three men a day. I want to know whether under the scheme you propose it is not an immense disadvantage that you would not begin to realise that gain?—I think the point I am trying to make is rather different; it is not whether the three men a day should be saved, but whether the Coal Mines Department is the Department to provide the appliances of safety or to provide they shall be procured.

29 April, 1919.]

MR. J. H. JONES.

[Continued.]

11,991. Again we are at cross purposes. I am not suggesting for a moment when you nationalise the coal interests that you should abolish the inspection of coal mines. I suggest when you have a public service you have not this collision between the profit making interests of the private owner and the interest of the State in preserving life?—Yes.

11,995. So your scheme does not realize the full possibilities of unification?—I quite agree with you. The first point which I do not quite follow is, that you are bound to lose under a scheme of unification, but decentralised control, precisely those benefits to which you refer.

11,996. You are bound to lose under the scheme?—Under the scheme I suggest here.

11,997. Supposing you have a minister in Parliament who is hauled over the coals when a man is killed or an accident occurs, are not accidents more likely to be avoided than at the present time; does your scheme provide for that?—No.

11,998. Am I right in thinking that you suggest a subsidy should be paid from the surplus earnings of the more fortunate mines in aid of the poorer mines?—Provided the subsidy is required on account of the policy of the Board itself.

11,999. That is to say, provided you are satisfied that the mine is effectively administered?—Yes.

12,000. That the managers are doing their best and no waste?—Yes.

12,001. You see no objection to subsidising the profits of the less profitable mines?—It is in the scheme of nationalisation put forward by the Fabian Society.

12,002. Do you see any objection to that?—Under the scheme I do not.

12,003. You prefer it?—I prefer it.

12,004. Is it agreed it would be necessary to have stringent safe-guards to satisfy yourself that mines were not subsidized unnecessarily?—Yes.

12,005. Have you considered the use of a public costing system?—It is implied in what I say in the paragraph under "Control of Workers" or it is a corollary to that.

12,006. Are you satisfied that if you have a better costing system you could without the danger of

wasting money use the surplus of the more fruitful mines to subsidise the less?—Yes.

12,007. You speak of joint control. It is under the heading of "Control by Workers." Is there to be one representative of the workers on the board of directors?—Yes, one of the directors of the individual firms.

12,008. Is not that rather a limited form of Joint Control?—I suggest the possibility of a much greater degree of control, to which I have no objection, and which I would welcome provided the workpeople accepted the responsibility of control as well as the desired powers. It is in the second paragraph of the Supplementary Memorandum.

12,009. I suggest that this right to nominate a single director on the Board is a right which would be quite worthless in practice?—It is a compromise. I am sure that it is worthless, and for this reason. In the first place the suspicions of the miners would be very much reduced if they felt their own representatives were there when policies were being discussed. In the second place it would be a tremendous advantage from the point of view of the men if they were represented before a point had crystallised and presented as a complete thing to the workmen themselves for discussion.

12,010. It is hardly joint control; it is not very "joint"?—The whole thing hangs on the second paragraph of the Supplementary Memorandum.

12,011. *Mr. Arthur Balfour*: I take it you feel there is not sufficient precedent to warrant the risk of complete nationalisation straight off?—I have no prejudice against nationalisation. My prejudice on the whole is in favour, I think. But I do feel that here for the first time in the history of this country we have an opportunity of experimental legislation, and it does seem a great pity that we should take a huge leap in the dark when we could walk forward slowly and feel our way.

12,012. You would not be in favour of any gradual system to subsidise the export trade of coal against the home coal?—You mean the policy of dumping?

12,013. Yes, the policy of dumping abroad?—No.

(The Witness withdrew.)

(Adjourned to to-morrow morning at 11 o'clock.)

SECOND STAGE—FIFTH DAY.

WEDNESDAY, 30TH APRIL, 1919.

PRESENT :

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. R. W. COOPER.

SIR ARTHUR DUCKHAM.

MR. J. T. FORGIE.

MR. FRANK HODGES.

SIR LEO CHIOZZA MONEY.

MR. ROBERT SMILLIE.

SIR ALLAN M. SMITH.

MR. HERBERT SMITH.

MR. R. H. TAWNEY.

MR. SIDNEY WEBB.

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE (*Assessor*).

MR. ARNOLD D. McNAIR (*Secretary*).

MR. GILBERT STONE (*Assistant Secretary*).

Mr. Arthur Balfour: Sir, may I ask that the Trades Disputes Act, 1906, be circulated to the Commissioners?

Chairman: Yes, it shall be circulated at once.

Mr. SIDNEY WEBB, Recalled.

12,014. *Mr. Evan Williams*: You have quite made up your mind, I gather, that nationalisation is the best means of conducting the coal industry?—If I had to give a decision at this moment, I should

certainly act upon that principle, but I hope I am always willing to be corrected and to learn, and therefore it is only a question of your asking me my opinion at this moment.

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

12,015. So that you have an open mind on the matter?—I have quite an open mind on all subjects.

12,016. And you are quite prepared to change your mind upon this matter if it is proved that all these advantages which you claim for nationalisation can be procured by some other means?—I should certainly be prepared to give very sympathetic consideration to any alternative.

12,017. Your present opinion is founded, as you say, upon a study of these matters?—Yes.

12,018. Both as regards production and distribution?—Yes.

12,019. With regard to production in the first place, are your conclusions based upon a close observation of the practical working of the industry?—Of all industries generally—not particularly coal.

12,020. Have you given to this industry any close observation?—Not any thing that could be called close observation over any long term.

12,021. To what extent have you given any observation to the working of the coal industry?—I have never been personally engaged in the working of the coal industry.

12,022. Have you ever been down a colliery?—I have once been down a coal mine a long time ago, but I do not give anything for that. Anyone going down a coal mine does not see any more than he is asked to see.

12,023. I quite agree with you. Have you, in forming your opinion, based your conclusions at all upon the opinions of persons practically engaged in the industry?—I have endeavoured to consult persons personally engaged in the industry, but my experience has been that those engaged in the industry on the owners' side (may I say?) are very unwilling even to consider the possibility of any change in the industry, and when I was concerned three years ago with writing the pamphlet which has been referred to (it was then a chapter in a book) I sought information from various people, but I found it impossible to induce any colliery owner, or shareholder, or manager, or mining engineer, that I could get at even to reveal any of the secrets of the existing organisation.

12,024. You did not find any one of them who had any idea that nationalisation would be an improvement in the management of the industry?—I am sorry to say I did not find many of them who had any ideas at all: they were practical men.

12,025. Without ideas?—Yes. That, I venture to say, is one of the great evils of the existing profit-making system in coal mining as in other industries, that the practical men are men shockingly destitute of ideas.

12,026. So that you attach no value to the opinion of practical men upon this matter at all?—I should attach very great value to the opinion of practical men upon the subject if I could get it, but they are so seldom willing to form an opinion.

12,027. If you do get it on this Commission, you would attach considerable value to it?—I should attach all the value to it which commended itself from the intellectual character of the gentleman who was giving evidence. You see this is a subject which requires a consideration of general ideas, and merely working in a coal pit or in a coal mining office will not give you general ideas. It is a question of statesmanship.

12,028. So that you really attach more importance to the opinion of the theorist in this matter than the practical man?—In the English language—especially on the lips of practical men—"theorist" is generally used as a term of abuse. It really ought to be the highest term of praise. Therefore, it is difficult to know in what sense it is used. As a matter of fact I suggest that this is a question for, in the literal sense of the word, statesmanship.

12,029. Without consideration of the view of the practical man at all?—No; any statesman takes into consideration all the views of everyone he can get because he has to deal with them.

12,030. But your opinion is formed without the aid of those views?—No, I have taken advantage of all the views I could get, and especially everything that was in print, and as much as I could get orally, and I could not do any more. May I explain that I think it is desirable, and perhaps even a duty, that people should formulate views on subjects like this, even if they have not the whole of the information. When I wrote that particular pamphlet three years ago I deliberately did it, although I had not the fullest possible information, because I thought it was high time that something was set down definitely in order that it might be corrected. I am sorry to say that so far as I can discover from the whole of the coal-mining industry there has been no serious criticism of that pamphlet so far as my knowledge goes. I do not say it is not open to criticism, but I only regret that the coal-mining industry never took the trouble to criticise it or even to consider the proposal.

12,031. There may be several reasons for that?—Yes, there may be.

12,032. Do you want to nationalise the coal industry more particularly than any other?—I think industries become ripe for nationalisation at different dates and stages. The coal industry is one of the first which admits of nationalisation.

12,033. You think the coal industry has ripened to that stage?—I think it has become imperative in the national interest that it should be promptly turned into national ownership. There is a very serious national loss every week and year that it is delayed.

12,034. And you are convinced of that?—I am convinced of that at present, but I am here to be converted.

12,035. I suppose, following that, you would nationalise every industry in turn?—Between now and infinity possibly that might happen.

12,036. What is there in particular in the coal industry that makes it to your mind the first that should be nationalised?—I do not say the first; I said one of the first. In the first place coal is an article of common necessity which is of vital interest to our industries. In the second place, it is an industry which is very badly organised at present, and suffering very seriously from disorganisation or lack of organisation on all hands. There are the distributors who are unorganised and inefficient—men inefficient by reason of the distribution system. The coal mines are unorganised, and therefore inefficient as a system; and even the royalty owners are unorganised, causing sometimes a great deal of trouble.

12,037. I shall ask you upon what you base that presently. Do you disapprove profit-making at all?—I think it is a low motive and corrupting.

12,038. And you think it should be done away with altogether?—No. You cannot actually do away with motive by Act of Parliament, but I think a form of organisation could be devised which would give less scope to that motive and more to other motives.

12,039. You would like to do away with it, would you not?—I have not any such pretensions as that, but I would give as little scope to profit making as the state of organisation would permit.

12,040. Even if the results to the nation from the present profit-making system were better?—In that case if the results to the nation of the present profit-making system were better, I should not condemn it.

12,041. Is it not up to those who advocate nationalisation to show that the nation would be better off as a whole than under the present system?—I think the matter is a little shifted; it is for those in the dock to show profit-making is worthy of being continued. It is profit-making which is on its trial at the moment.

12,042. Is the man in the dock to be condemned unless he can prove himself innocent?—No, I do not suggest that.

30 April, 1919.]

MR. SIDNEY WERN.

[Continued.]

12,043. But it comes to that, does it not?—No, I was following your metaphor. It is not for me to prove my case except as an indictment of profit making.

12,044. If you propose to substitute something for the present system, surely it is up to you to show that the proposed substitution is better?—I am willing to take it on that line, but the exculpation of profit-making does not depend upon that.

12,045. Is there anything in what you have written before or in your proof that shows that nationalisation is going to be better, or which proves it?—That is really a matter of opinion. I think myself that there is, but I should not wish to impose that opinion upon anyone else. What I have written stands for itself.

12,046. Is it any more than a condemnation of the present system?—I think it is.

12,047. I grant you that, to the extent that it is a suggestion of something better, but without any proof of that?—If I may say so, in the strict sense of the word "proof," it is impossible to prove anything about something which does not yet exist. I have not pretended to prove that.

12,048. You suggest it really as an experiment?—No. Again, if I may say so, that is a dyslogistic way of putting it. As a matter of fact, to do nothing is an experiment. At the present moment for the Government to do nothing in this matter is to my mind a very serious experiment, which is weak by week having palpably bad results. It is the resource of weak minds to believe that doing nothing is to avoid a decision, but really it is as great and as momentous a decision as doing something.

12,049. Do you consider releasing an industry from control by the Government is doing nothing?—I did not say that. Whether you want to release the industry from control is an arguable matter. I was only protesting against a policy of inaction.

12,050. Would you call that an experiment?—Yes. All these things are experiments.

12,051. You mean that a reversion to the pre-war state would be an experiment?—A reversion to the pre-war state would be a most grave experiment fraught with grave national peril, but there is no chance of that.

12,052. I suppose that is what is intended to be done in all other industries?—I hope not; if so, there will be trouble.

12,053. Of course I do not suggest that any other industry will be reorganised in the way you suggest with regard to the coal industry?—Let us keep to the principles. There will be trouble if there is any attempt to revert to pre-war conditions.

12,054. Is there going to be no trouble if there is a radical change of this kind in the coal industry?—Probably. I do not make any suggestion to the contrary.

12,055. I understand that you claim in the coal industry under nationalisation you would get better wages for the workmen and better conditions of life?—I have not actually put it in that way, but I should say nationalisation will conduce to better conditions of life certainly, and better conditions of employment in the large sense.

12,056. Without higher wages?—I did not say without higher wages. I think there might be possibly higher wages, and there probably will be higher wages.

12,057. Do you expect the price of coal to come down?—No, I cannot tell you about that, but I say that it is possible even that the price of coal might come down.

12,058. With higher wages?—Yes, with higher wages.

12,059. And a lowering of the price of coal?—Yes.

12,060. Is there any profit to be made by the State out of working the coal?—I think that is a possibility.

The mines would not be run for the sake of profit, but as you cannot run any national enterprise with an exact figure, there would probably be an incidental profit as in the Post Office.

12,061. Do you think the nation could stand the running of big industries of this kind without profit?—Pardon me! I did not suggest it should be run without profit. On the contrary, I was suggesting it would be inevitably run with profit as the Post Office is.

12,062. Would it be as great a profit as at the present time?—I do not think it is necessary or desirable that the State should make as large a profit out of the coalmining industry as the present owners and royalty owners are making. I do not think that is an advantage. It is not to the advantage of the nation that individuals should make profit, but it is very often to the detriment of the nation.

12,063. That is to say, that there should be production at such a cost as to leave a margin of profit; do you think that is detrimental to the nation?—No, quite the contrary; I was expressing quite the contrary view.

12,064. But is not that what it comes to?—No, it is not. What I mean is, that a profit which provides the capitalist with anything more than is absolutely necessary for the carrying on of the industry is a loss to the nation and a waste.

12,065. Is not that excess of profit which is more than necessary to carry on the industry devoted to carrying on other industries either in this country or abroad?—I do not understand. In so far as there is any profit to any individual other than what is absolutely required for the carrying on of the business, I suggest it is from the economical point of view a loss and a waste.

12,066. Even if that profit is derived from abroad by the export of coal, for instance?—That is an attempt to levy tribute on foreign countries which I do not think on the whole pays in this country.

12,067. Coming down to the actual practical question of the financial condition of this country at the present time, do you not think it is imperative that every industry should be run at the highest possible profit?—No. I think for every industry to be run at the highest possible profit would be ruinous to this country, because it would mean the diversion of an unnecessary part of the product for consumption in an unnecessary way. The profits of the capitalists are not an advantage to the nation, but a loss to the nation, in so far as they are not absolutely required to carry on the business. There is no advantage to the nation in the capitalists getting higher profits. There is only an advantage in their getting just enough, and even that we may be able to dispense with under other conditions. But the advantage of higher profit is non-existent: it is a loss.

12,068. This is, of course, an academic question, but it is a serious one as to whether this war is to be paid for by this country?—Yes, but I have never heard it suggested that the war could be paid for by the capitalist getting higher profits. All the profits that go to the capitalist are a detriment to our paying for the war.

12,069. On what is taxation to be levied to carry on the government of this country?—It surely cannot be suggested that it is desirable to pay high profits to the capitalist in order that the State should get back a small proportion of that profit in taxes. That is a ruinous method of finance. It is putting butter into the dog's mouth in the hope of getting some of it out.

12,070. I do not think the comparison between putting butter in a dog's mouth and taxing the profits of the capitalist is at all a fair one in this matter. However, I think we are digressing. You are suggesting a very elaborate administration to carry on the coal trade as a national industry?—But it is much less elaborate than the present system, I may observe.

12,071. Do you think the administration you propose would be entirely an addition to the present

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

administration?—It would be in substitution for the work of the present administration.

12,072. What part of the present administration is going to be done away with by your suggestion?—I first of all propose that the existing shareholders and debenture holders should be relieved from any function which they perform in the administration and in return for which they receive a considerable income. Then, secondly, the great mass of the directors of the companies would be relieved except in so far as some of them might serve on the advisory councils. Then a large part of the administration of the administrators in the distribution trade would be relieved.

12,073. I am confining myself to the production side for the moment?—Yes, but the case includes distribution. It is very difficult to separate one from the other.

12,074. I think they are easily separated. I am speaking now of the production side of the industry?—Yes. The difference would be this: that you would have a Minister and certain district superintendents instead of 1,500 Boards of Directors.

12,075. The shareholders, of course, you eliminate, and you pay them interest on capital in future, or what will represent their capital in Government stock, so that that makes nothing either here or there in the matter?—Personally I have suggested all the shareholders and other interests should be adequately compensated according to the principles laid down by Lord Sumner's Committee.

12,076. Have you made any sort of estimate as to the number of people you would require for the central and local administration?—No.

12,077. Have you made any estimate of the cost of it?—No; because I think it is impossible to draw up any precise plan, and it is merely in order to be of some service to the Commission that I have put down the heads of the plan that I think might be adopted.

12,078. Do you not think it is inevitable that there must be a very large increase in staff?—No. I think on the contrary there would be a probable diminution in staff except in so far as very important functions, which it is to my mind almost criminal of the present industry to be without, would have to be supplied in any efficient industry.

12,079. You are referring to research work, are you not?—Yes, and statistical work and costing and precautions against accidents. All the new services would, of course, involve new staff.

12,080. Is it your experience that a Government Department is managed with a smaller staff than a privately-owned concern is?—Yes, that is my experience. In so far as you can compare like with like, a Government Department is managed with a smaller staff than the corresponding system of administration is managed under separate ownership in an industry. The reason is this—the number of the Government staff is known and their salaries are entered in an estimate; the number of the staffs employed by the colliery companies, for instance, is not known and their salaries are not entered in any common estimate.

12,081. Do you suggest they employ more persons than are necessary?—No, I do not suggest that at all. I think they have a silly system; that is to say, if you divide your 3,000 mines up between 1,500 separate companies and you have several thousands of distribution firms, that necessarily involves more work and more staff than if you have any single organisation. It is not a question of Government, but a question of having a single organisation instead of this chaos of warring atoms.

12,082. Do you suggest there would be a single man less employed on the staff of a colliery under nationalisation?—I have already pointed out that probably there would be new departments of work undertaken which would involve an increased staff.

12,083. But I mean apart from new departments altogether?—I can only suggest that if I had the organisation of the coal distribution of London, I do not think I should spend so much on establishment expenses as the £800,000 a year which is now allowed.

12,084. I am not speaking of distribution but of production?—If you give me up distribution, then perhaps I shall be able to save something towards an increase in the staff of the colliery, but I am not admitting there is going to be an increase.

12,085. That is not an answer to my question?—I have tried to answer that there would be a number of new departments for work which is now neglected.

12,086. I ask you to confine yourself to the existing departments. Do you suggest there would be one single man less employed at any one particular colliery controlled as it is at the present time?—If you mean the staff of a particular colliery, certainly I think there would be no man less in fact, but the colliery would probably appoint a safety manager in addition to the present management. I think it is very likely. I was not referring to a particular colliery, but to the organisation of the industry. After all, a colliery is not the coal trade.

12,087. No, but it has to be organised by units?—Yes. I do not know that I can help you. I have not suggested there would be any fewer men employed at any particular colliery. I have suggested that the office organisation of the industry would be relieved of a certain number of people.

12,088. Is not your inability to help rather due to your want of knowledge on the matter?—No; I think on the contrary that I have rather considerable experience in this matter of organisation of staffs.

12,089. Of collieries?—No. I have not troubled to organise a colliery. I have not had the opportunity, and I have not suggested that the organisation of the colliery—if you want to go down to that detail—will be altered, but it is the organisation of the industry.

12,090. Would the organisation in a district not require a very large addition to the present staff?—I think there would be for the new functions.

12,091. I mean for the co-ordinating of these collieries and keeping them in line with one another?—Have they been co-ordinated at present?

12,092. No?—Then it was a new function. If you mean that the fact that they have gone on without any co-ordination at present will involve a staff to co-ordinate them, certainly. That is part of the price—the very small price—which you have to pay for co-ordination, which is a new function.

12,093. Would not the co-ordination of districts involve a very large staff again?—No, I think not. I think it will be very cheap compared with the advantages. I am quite sure if you were to go to an American organiser of industry and propose to him the possibility of uniting the 1,500 coal concerns into one combine, he would regard the opportunity of co-ordinating—especially scientific costing and comparison—as a source of very great economies. It is not a question of nationalisation, but of one form of organisation as compared with another. Unification would make the same economies and the same advantages as it chose, but it would have no motive other than profit-making.

12,094. It is a matter of opinion?—Everything is a matter of opinion, of course.

12,095. If those who have practical knowledge of the industry disagree with you, what would you say?—I should estimate, of course, the value of any man's judgment, not by his knowledge of coal, or even his knowledge of a colliery, but by his knowledge of the possibilities that are open to him by scientific costing and comparison of a really efficient organisation of the industry which does not exist in the coal trade.

12,096. Are you sure that it does not exist in the coal trade?—Yes. I do not think anyone has ever suggested that the organisation of the coal trade at the present time is efficient.

12,097. No one has suggested that it is perfection, but I submit to you that there has been no evidence that it is inefficient?—We have it in evidence from Sir Richard Redmayne "that the organisation is extravagant and wasteful is generally accepted." At

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

any rate it is Sir Richard Redmayne's opinion, and he has given in evidence that it is generally accepted that it is extravagant and wasteful. I should not put myself up as an authority against that statement.

12,098. And you think Sir Richard Redmayne's statement applies to the industry as a whole?—Certainly it did as a whole, but not in detail.

12,099. And that is the only opinion upon which you base your view that the industry is inefficient?—Pardon me!—not quite the only opinion. If you remember for the last 100 years there has been a stream of controversy as to the desirability of combinations in the coal trade.

12,100. I do not remember the last 100 years?—I need not remind you of the very extensive arguments and discussions that there have been, and always the argument has been that the industry was inefficiently organised and that if it could be only combined it would be then very much more efficiently organised, but the owners have never been able to combine.

12,101. I think we may have an opportunity of asking Sir Richard Redmayne what he did actually mean?—Well, we have in evidence what he said.

12,102. With regard to the distribution, have we had any evidence at all on this Commission of the conditions before the war?—Yes, I think so.

12,103. Was not the whole of the evidence confined to conditions during the war?—No. We had evidence from the Coal Controller's Department of what the expenses and profits of the distributing firms in London had been before the war, because he endeavoured to keep them at the same rate.

12,104. Was it not your complaint that he had given them extravagant amounts in excess of the profit they would have made before the war?—No, that is not quite it. He had endeavoured to keep it at the same rate; and, because the tonnage was reduced, to keep the same amount of profit for each firm it was necessary to raise the allowance per ton. I do not think it has been suggested that a larger profit has been made in the distribution of coal in London than before the war in the aggregate. The figures were the normal figures, so far as the Coal Controller could ascertain.

12,105. But all the evidence we have got, apart from the profit on the distribution of coal, was for the war period?—I submit not. I submit that the Coal Controller's Department gave evidence as to what they found the profits to have been in the pre-war period.

12,106. I say apart from that one bit of evidence about the pre-war profits?—Yes, but consider how important was that piece of evidence. That was official evidence based upon examination of the books of the firms for London.

12,107. That is apart from profit?—No. I am speaking of profits.

12,108. Leaving profit aside, have we any sort of evidence as to the distribution of coal other than that which obtained during the war period?—I am afraid I am not able to understand. I think we have had evidence.

12,109. I do not think we have?—I am sorry. I do not know how far you suggest it would be desirable to go back.

12,110. I mean the whole of your comparison, if it is made upon the evidence that has been given here, is a comparison with an entirely abnormal period?—I really must protest against that. That is an attempt to discredit or weaken the evidence given by the Coal Controller's Department, who gave evidence of a very valuable kind and very convincing kind, and not merely with regard to war conditions. It was evidence of a very convincing kind as to the actual cost and expenses and profits of the pre-war period, and that evidence might perhaps be impugned, but it has not been impugned and it stands.

12,111. That is as to profits?—No, as to expenses as well. Surely it will be within the recollection of the Commission that tables were put in showing what the distribution costs were for each item in the pre-war period and for the period during the war. That was evidence which was as valuable evidence in respect of the pre-war period as for the post-war period.

12,112. That is still on the question of cost and the margin over and above cost. It really comes back to that?—I beg your pardon. Is there anything else?

12,113. I mean the method of distribution of coal over the country. We did not get any evidence as to the pre-war period?—I do not think any evidence has been given as to the method of distribution of coal over the country except incidentally.

12,114. Except for the war period?—No, it is not a question of the war period. There has been no evidence given about it.

12,115. There has been a good deal of evidence?—I do not agree. There is a considerable amount of evidence as to the railway distribution of coal in the pre-war period, and separate ownership of the trucks, and as to the smallness of each consignment. We were told that on the London & North Western Railway 80 per cent. of all the coal carried by that railway went in consignments of under 20 tons, and consequently at very increased expense. That has been given in evidence, and I give it in evidence now.

12,116. Was it given in evidence that that was a cause of increased expense?—Yes.

12,117. By whom?—It has not been given in evidence here, but it was given in evidence by Sir James Inglis before one of the Committees.

12,118. While we are on that point, do you suggest it is possible to distribute coal in bigger quantities than that all over the country?—Yes, and it is done already in this country in certain cases.

12,119. Yes, where more is required. Do you suggest country stations should get their deliveries in bigger quantities than that?—As a matter of fact I do. Under a properly nationalised system they would get deliveries in bigger quantities than that, because the smallness of the consignment is due to the fact that there are a very large number of dealers in coal each of whom orders his small consignment; but if you had one distributor for each local area, he would have only one order, and he would be supplied as a matter of fact for the quantity budgeted for during the year in a certain number of trains. It would not be necessary to send 10 tons at a time.

12,120. You would send him a whole train load?—Yes.

12,121. And let him stock a year's or six months' supply at a time?—No, not necessarily a whole year's supply, but I do suggest that the consignment going in 5- or 10-ton lots is a very serious cause of expense and trouble and loss of life of the shunters, and I suggest that that is due to the present system of separate ownership and can be only got rid of by a unification system.

12,122. And you suggest with a unified system the country station should get coal in train loads?—I did not say that, but I said it would get its coal in much larger consignments than these 5-ton lots.

12,123. Do you suggest that would be an economy?—I do. That has proved to be an economy.

12,124. Where and by whom?—It was proved by the figures of the Coal Controller's Department.

12,125. Have we had any figures with regard to the distribution of small quantities in that way?—Yes, I think so.

12,126. Of less than a complete truck load?—That is my impression.

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

12,127. Do you suggest it would be an economy to deliver coal which had to be put in stock in a large quantity at stations rather than send a truck load and cart out of the truck and send the truck away when empty?—Is it seriously suggested that the distribution of coal in 5-ton lots all over the Kingdom is an economical system?

12,128. 5-ton lots is a different matter. I am speaking of single truckloads?—But a great many trucks only carry 5 tons.

12,129. There are very few trucks which carry only 5 tons—that is of the trucks which carry coal?—If you are asking me whether the distribution of coal in 5- or 10-ton consignments all over the Kingdom is an economical system, I say no; it is a most extravagant system.

12,130. Do you suggest coal is being distributed in 5-ton lots all over the country?—Yes, 5- and 10-ton lots.

12,131. I am speaking of 10-ton lots?—There are some 5-ton lots, and 80 per cent. of all the coal carried on the London & North Western Company goes in consignments of less than 20 tons—80 per cent. of all the coal on that vast system.

12,132. That is two truckloads at a time?—Yes.

12,133. Or it may be one?—Yes, that is a highly extravagant system, and I venture to say no one acquainted with organisation or administration would dream of suggesting that that is an economical system.

12,134. I should be very much surprised if anyone connected with the trade suggested it was more economical to send coal which had to be put in stock at a railway station. I am afraid that it is a difference of opinion between practice and theory?—No; I do not think it is a difference of opinion between practice and theory. If it were, theory is the better guide. Any intelligent person would follow theory rather than rule of thumb.

12,135. Do you say he would follow theory rather than experience?—I say rather than rule of thumb. Of course no one should act only on theory, because that would be making it a rule of thumb.

12,136. Do you suggest the coal trade should be guided by theory even if that is contrary to practice?—Short of miracles you cannot have practice contrary to theory.

12,137. There is evidence here that you can get theory very contrary to established practice.—Your theory may be inaccurate.

12,138. That is what I am suggesting.—Is it a theory or a fact that the earth goes round the sun?

12,139. I do not think we had better digress into astronomy?—No; perhaps we had better drop the use of the word "theory."

12,140. You say you would remove entirely the present incentive of profit-making in the industry?—I should wish to do so.

12,141. Would you remove it from everyone engaged in the industry?—Yes.

12,142. The owners, the officials, and the workmen?—Yes.

12,143. You would remove the incentive of profit-making from the workman?—Yes. I look upon profit-making as a low and corrupting motive desirable to be got rid of so far as possible. Unfortunately we cannot get rid of it in all industries as yet, but so far as you can organise social life without profit-making it should be done.

12,144. Profit making is somewhat deeply engrained in human nature, is it not?—No; it has only prevailed over a small part of the earth's surface during a small period of its existence.

12,145. It means, does it not, getting as much as one can for oneself?—That is not profit-making but self-interest; profit-making is one special department of self-interest. Profit-making is an entirely new motive for the administration of industry. It has not

prevailed over any part of the earth's surface for very long, and it does not prevail over a large part now.

12,146. But it is one of the strongest incentives to getting as much for oneself as one can, is it not?—Profit-making is a special form of that.

12,147. Before you do away with that, you would have to change human nature, would you not? Can you do that by Act of Parliament?—My answer is yes. As a matter of fact human nature contains a great deal more than profit making, and consequently you can get along without necessarily changing human nature—not that I shrink from that, because we change human nature every day.

12,148. By Act of Parliament?—Yes. We do not pass Acts of Parliament every day, but whenever we do pass an Act of Parliament, we to that extent change human nature. Human nature is the most malleable of things. It is altering every year and in every generation. It varies from class to class and climate to climate.

12,149. It is an interesting topic, but I do not think it is quite germane to this enquiry.—I agree.

12,150. In your proof you speak of the "relative inefficiency of the British coal supply." That is relative to what?—Relative to what it might be.

12,151. Relative to perfection?—Yes.

12,152. Do you consider that it is inefficient relative to other trades in this country?—"Other trades" are rather a large number. I did not intend to compare coal-mining with other industries there.

12,153. Is it inefficient compared with coal-mining in any other country?—I really do not know, but no other country has nationalised its coal supply, and if you compare one chaotic system of private adventure in coal with our chaotic system of private adventure in coal, it does not seem very important to decide which is the better.

12,154. Is any system which is not nationalised chaotic?—Any system which is not unified is chaotic. The very basis of the private ownership of collieries is the competitive jostling of one with another.

12,155. Is not all improvement brought about in that way?—No, or very little improvement in my opinion.

12,156. You admit, I take it, that the industry has progressed very considerably in this country during the last 40 years, say?—The industry has got larger, yes.

12,157. And is it not more efficient than it was 40 years ago?—I should imagine so. I really do not feel quite sure, but I should imagine so.

12,158. Is an industry which has grown from say 50,000 tons output to 287,000 —?—It is entitled to the merit of having grown.

12,159. Is it carried on more scientifically to-day than 40 years ago?—I should hope so.

12,160. Do you know?—No, I really do not know, but I can admit that it must be.

12,161. You cannot make any comparison between the industry to-day and 40 years ago?—No, my acquaintance with it 40 years ago was rather small.

12,162. Well, say 20 years ago?—I feel a difficulty in making a comparison, but I will accept it that it has taken advantage of the advances in science which has been made.

12,163. The death-rate in the industry has been decreased a good deal, has it not?—If you reckon per 1,000,000 tons raised, yes, very satisfactorily.

12,164. And per 1,000 men employed?—Yes, I suppose so. The total number of deaths does not fall, but there is more coal raised for each death.

12,165. But per 1,000 men employed has not the reduction in accidents generally been very marked?—Unfortunately I am not able to ascertain that. The proportion of accidents to tonnage, or the proportion of accidents to men employed, compared for a series of years has not been published.

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

12,166. Let us confine ourselves to fatal accidents?—Yes, but, unfortunately, if you confine yourself to fatal accidents you are liable to error. The number of fatal accidents is happily very small compared with the number of serious accidents, and the 1,500 deaths in the year are only a very small proportion of the 150,000 serious accidents. The proportion of deaths has diminished, but we do not know that the proportion of serious but non-fatal accidents has diminished, if they have done.

12,167. Do you suppose for a moment if the proportion of deaths has come down to half that the proportion of other accidents must not have followed in the same way?—I am afraid I cannot draw that inference, but I do not assert that the proportion has not improved.

12,168. Does it not necessarily follow that the causes of both classes of accidents are the same?—I think not. I think we are apt to be misled by remembering the explosions. But the explosions are such a very small part of the accidents that I do not think you can infer that the casualties will be proportionate to the deaths.

12,169. You mean non-fatal accidents in proportion to the fatal accidents?—Yes.

12,170. Apart from explosions, are not the causes of fatal accidents and non-fatal accidents actually the same?—I think not, but I may be wrong.

12,171. I suggest very much that you are wrong?—Then let us have the figures.

12,172. No, I mean the causes—the very causes which you put yourself afford the proof: run over by trams, shaft accidents, and that kind of thing. Are they not the same causes which produce fatal accidents as non-fatal accidents?—I do not make a point of it, but I do not draw that statistical inference. It seems possible the number of fatal accidents might have diminished very much more than the number of non-fatal accidents. Perhaps I am wrong. I do not make an assertion on the subject, but I refuse to accept the contrary assertion.

12,173. If the fatal accidents have diminished, is not that proof that the industry is more efficient than it was?—Yes.

12,174. And a strong proof?—Yes.

12,175. And that has been brought about by private ownership?—It has been brought about partly by the Home Office in opposition to private ownership.

12,176. I do not think you are justified in saying that, but it has been brought about under private ownership?—It has been brought about under His Majesty's Government.

12,177. The control of the Home Office over the coal industry, you say, has been responsible for it?—I only put in a claim for part of the credit to the Home Office.

12,178. Then the rest is due to the managers of the mines?—May I put it in my own way? I would say that a number of managers and owners of mines have desired to prevent accidents and have wished to discover means of preventing accidents and have co-operated with the Home Office in preventing accidents. Some others have not, and the permanent pecuniary interest of the owners has been necessarily and innocently against any expensive precautions for the prevention of accidents, and they have, as a matter of history, resisted a number of the proposals of the Home Office for such precautions.

12,179. Do you suggest really that owners object to putting in appliances that are prescribed because of the expense?—Yes, certainly they do. They would not be profit-makers if they did not. They would be bad people of business if they did not object. There must be always an objection to any improvement, however valuable the improvement is, when it costs a great deal of money, and it is quite a proper objection.

12,180. Are you not aware that the objection of the coalowners generally has been to the prescription of a certain kind of appliance?—Quite so. That is the form the opposition always takes. No one is opposed to improvement in the abstract. It is only when a suggestion is made of a concrete improvement that it meets with opposition.

12,181. If there are differences of opinion as to the way in which a certain improvement could be brought about, and the Home Office prescribe one way only without giving latitude to the colliery managers, do you not think it is natural that there should be objection to that?—That is what I have said. It is quite natural and it has happened.

12,182. Is that actuated by motives of pecuniary gain?—I did not say it was actuated solely by motives of pecuniary gain. I do not mean that the owners consciously and deliberately resist an improvement for the sake of profit, but there is this standing pull on their minds of the importance of making profit. I am not making an indictment against them, but it is a quite inevitable accompaniment of the profit-making organisation.

12,183. When you say it is cheaper to compensate for accidents than to prevent them, are you not making a serious indictment against colliery owners and managers?—No, not against the owners and managers but against the system of profit-making. I make a very serious indictment against the system of profit-making because when it finds it is cheaper to compensate for accidents than to prevent them it weakens naturally the stimulus to prevent accidents. But that is the fault of the system.

12,184. On what do you base your assertion that it is cheaper?—On a study of the Employers' Liability Acts and the Workmen's Compensation Acts for the last 40 years.

12,185. Have you any figures to prove that?—I have not them in my head.

12,186. Have you them anywhere?—No, it is not possible to produce figures as to what the cost has been or would be. I am only giving you a judgment for what it is worth.

12,187. Why do you make an assertion of that kind when you have no basis in the shape of figures?—You may take it for what it is worth. It is based upon an examination of the proceedings. I have written on the subject once or twice in the course of my life, and it is based upon an examination of the discussions and arguments and proceedings relating to employers' liability and workmen's compensation and the reports of the insurance companies on the subject, and I do give it as my judgment that it has been ascertained, and it has been admitted to me by various business people, that as a matter of fact it usually costs less to compensate for accidents than to make arrangements which would to a considerable extent prevent them. Of course I go on to say that many managers and owners do nevertheless try all they can to prevent accidents when they would very often make more profit by not preventing them.

12,188. You say "it has been ascertained." It is a very serious accusation?—There is no accusation at all against the individuals but it is a serious indictment of the system of profit-making.

12,189. It must be an indictment against the individual?—Very well, if you think so.

12,190. And I say it is an absolutely baseless indictment until you can say, if it has been ascertained, upon what data it has been ascertained?—I have given you my basis.

12,191. It is an assumption you have made yourself from speculation upon the matter?—It is a judgment upon the facts as they have come to my knowledge.

12,192. What facts?—I have already mentioned the experience of the insurance companies and the mutual funds, and the statements made in discussions as to what would be the cost of this, that or other improvement which would prevent accidents.

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

12,193. What figures have you had?—I have no figures.

12,194. No figures at all?—No.

12,195. So that you make a statement of this kind, saying it is cheaper to compensate than to prevent, without having any figures before you?—Now let us be precise. The statement which I made which I quite hold to—

12,196. "Usually costs less to compensate for accidents than prevent them"?—Yes, that is my statement. You will observe by the very form of that statement that no figures can be given. It says "usually," and the statement is "usually costs less to compensate for accidents than prevent them." It is impossible to substantiate that by any figures. You will notice the word "usually." I defy anyone to prove that.

12,197. It means in the majority of cases?—Yes, in a majority of cases.

12,198. If it is in a majority of cases, it is over the industry as a whole?—Yes.

12,199. Do you suggest it is not possible to prove that?—Yes, I do, as a mere statistical matter. You cannot give what the cost of preventing them would be, and therefore it is impossible to prove that by figures.

12,200. That is why I say it is not right to make such a statement unless you can prove it?—That, after all, is a matter for each individual's judgment. The statement will only go for what it is worth.

12,201. Now with regard to housing, do you suggest there is any greater obligation upon the coal industry to provide houses for its workmen than for any other industry?—Of course, there is no greater legal obligation, but you probably refer to what we call the moral obligation. I suggest it is not a matter of one industry rather than another. It is a matter such as this: If a man starts an enterprise in a place where there is no housing accommodation, I venture to think that he is under a little moral obligation to see that the people whom he attracts to that spot to work for him have some opportunity of decent housing. Of course, it is on that ground I assume that the colliery owners very often, and, perhaps, very largely, have done something in the way of the provision of housing.

12,202. Do you say it is generally the case that colliery companies provide houses for their men?—I am sorry to say I have nothing in my head which would enable me to say whether it is more than half the companies or less than half the companies.

12,203. You advocate housing the miner at the expense of the industry?—Not wholly. I think the obligation of housing is one which should fall on the local authority, but this is a case of a special population which I have suggested is analogous to that of extraordinary traffic on the roads, in which case the local authority is not required to provide the whole of the expenses, but the industry is required to contribute, we may say, roughly, what is extra, and I suggest that the cost of re-housing the mining population ought equitably to be shared in some way between the housing authority—which means, ultimately, the ratepayers—and the industry, on the analogy of extraordinary traffic on the roads.

12,204. I do not quite appreciate the housing of the miners as being analogous to extraordinary traffic. Do they require more houses, or a different class of house, or anything of that kind?—I do not suggest that they require a different class of house or more accommodation, but when an enterprise is opened up in a place where there are no houses, it seems to me that we ought to ask the promoters of that enterprise not to throw the whole cost of housing upon the unhappy rural district council into which they may happen to go, but the promoters themselves ought to bear part of that expense. It is in that

sense that I think the mining population is a special case—not, of course, all the mining population, but where the mining population has been brought into a district in which there is not already housing accommodation.

12,205. Do you suggest that the mining population is worse housed than any other industrial population at the present time?—Really, that is a very difficult question to form an opinion upon. After all, it is like the hen's egg: it is not all over alike. I certainly think that the miners of Lanarkshire are worse housed, on the evidence, than any other section of the population. Of course, that is probably not true of Durham or Yorkshire, I think. It varies.

12,206. You do not suggest that a national scheme should apply generally over every industry with regard to housing. You do not think it is purely a national question?—As I have explained, I do not think it is a case in which the industry has a moral right to ask the local authority or the State to bear the whole of the expense.

12,207. Then, if the coal industry has to bear half of the expense of housing its own population, is it also to contribute its share to the housing of others?—Yes.

12,208. In addition to that: it has to pay twice over?—Yes, just in the same way that a quarry-owner has to pay his ordinary rate towards the upkeep of the roads and he has to pay over again any excess for the extraordinary traffic that he puts on the roads.

12,209. Does a miner's house impose an extraordinary expense upon a local authority that another man's house does not?—As I have explained, it is not the house but the fact that a number of those houses are required for the purpose of the industry which would not be required if the pit had not been opened.

12,210. Is not every house that is put up liable to pay rates like every other house?—Yes, that is so; but I am afraid the revenue to be derived from the miner's cottage will not pay the local authority for putting up the cottage.

12,211. Would that not be the same if any other industry were set up in the district?—Certainly, I have said so.

12,212. It is really a question of increase of population?—No, it is a question of the promoters of an industry attracting a new population to a locality.

12,213. Is there not an advantage of the authority that it should be done in that area?—I am not sure. Every house put up in West Ham inevitably means an increase of rates. The expenses attendant upon that house in West Ham involve a greater cost than all the rates which can be got out of that house. That is only one case.

12,214. Are you aware that collieries in areas where they exist pay a very large proportion of the rates?—That is so.

12,215. Are you aware that collieries generally are rated higher than any other form of industry?—No, I am not aware of that. I believe that is an arguable matter.

12,216. I believe it is the fact, and I know it to be the fact?—Well, I have not said anything to the contrary.

12,217. In that case, if the colliery company pays in a district the bulk of the rates, supposing it is the only industry in the district, whatever increase in rates is necessary the colliery company bears the bulk of it after all, does it not?—Yes, in that case.

12,218. Is it to pay in rates and to pay indirectly in building houses?—No, pardon me. I have not suggested that the collieries should pay for building houses. It has been suggested in the Chairman's

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

report that the payment for the colliers' houses should be met by a tax on coal, which does not fall, I assume, on the colliery owner. What I have suggested, on the other hand, is that it had better be taken out of national funds provided by the purchasing of the royalties.

12,219. If collieries are nationalised it would be a national charge in any case, would it not?—Yes, one way or the other it would.

12,220. You do not make any difference really to the nation, if there is a charge on this particular industry, or on the whole country, if it is national?—It depends on how it is charged upon the industry. In my opinion, 1d. a ton on coal would raise the price of coal, and then it would be paid by the consumers.

12,221. You suggest in your proof that a rise of 1d. a ton would have an effect upon our export trade?—Yes, we argue that it probably would.

12,222. You were not so keen in arguing that in the last stage of the Enquiry?—It may not have been my business to argue it. I am not aware that I took part in any argument.

12,223. I am not sure you did not take part in cross-examining in the contrary sense?—I am afraid that Counsel is not responsible for the line of his questions in cross-examination.

12,224. I hope that we are neither of us Counsel on one side or the other?—No, we are a co-operative enterprise for getting at the truth. It shows the benefit of co-operative working over private enterprise.

12,225. Now you suggest there are certain things than can be brought about by nationalisation in regard to falls of roof, shaft accidents and prevention of accidents, that cannot be done now. How do you suggest falls of roof are going to be lessened under a nationalised system?—I suggested that falls of roof and other causes of accident were at present continuing more than they need do, because of the pull of the profit-making motive preventing costly precautions against accidents, and that if you could get rid of that pull of the profit-making motive you would probably have the precautions made more freely.

12,226. I am asking you what precautions do you suggest should be taken to prevent falls of roof that are not now taken?—I suggest that all the necessary precautions should be taken to keep the roof up and prevent the falls.

12,227. Are they not being taken now?—No. The proof that they are not being taken is that you have this large number of accidents.

12,228. How do you suggest that the roof can be kept up under a nationalised system of working better than under the present system of working?—Because, as I have endeavoured to explain, at the present time for every piece of timber that is supplied the owner of the colliery has to pay, and that is a deduction from his profits.

12,229. Do you suggest for a moment that he refuses to supply adequate timber because of the cost of it?—Yes.

12,230. That is a very serious accusation to make?—I now want to read a case from the last Annual Report published by the Home Office on the subject: "The mine was not and had not been in conformity with the Coal Mines Acts in many respects. The offences relating to the supply of timber were of a serious nature. In certain places the roof under which the work was carried on was not adequately supported (as required by Section 50 (1) of the Coal Mines Act, 1911), and a sufficient supply of timber or material suitable for supports was not kept within 10 yards of every working place as required by Section 51 of the Act. The workmen were, if they required timber, to draw it from the waste or other disused places."

12,231. You read that to us yesterday?—I read that in response to a question yesterday. I am afraid

I may have to read it in response to a question to-morrow if I am asked the question.

12,232. Do you suggest that one case of that kind supports your assertion?—Yes, I consider that that one case gives certain reasons to suppose that the numerous accidents which are occurring, which prove that adequate timbering was not done, are through contraventions which exist; and I am supported in that fact by the Home Office, which immediately follows on that by urging compliance with the law on this point. Now the Home Office would not have urged compliance with the law on this point had there not been some reason for it. In fact, there was almost a matter of complaint that this star was being brought.

12,233. Do you suggest that it would not be possible for one case to occur in 3,000 collieries of inadequate timbering under the nationalised system?—No, certainly not.

12,234. Are you aware that the majority of accidents that take place from falls of roof are either due to inadvertence or errors of judgment or negligence on the part of the men in not putting up the necessary timber?—I have no doubt that that can be alleged. Obviously, I am not in a position to judge how far it is accurate. All I know is that there were 718 separate accidents from this cause and 733 people were killed, and that that was in excess of the average of the preceding five years, and that is a very grave fact.

12,235. There had been an increase in the accidents from falling roof?—As compared with the previous five years. I have not the figures for the previous periods.

12,236. You seriously suggest that those would be lessened under a nationalised system?—I quite seriously suggest that I should expect those accidents to be lessened in number if there were no longer a profit-making motive for being economical with precautions.

12,237. And you base that assumption upon the one case that you have just read out?—No, I base it on the 160,000 serious accidents last year.

12,238. Have you investigated the causes of any one of them?—I have not based it on any single case.

12,239. Are you able to base a conclusion upon them?—Yes, I am; because it is not an indictment of a particular colliery or the particular manager; it is an indictment of the profit-making system which has a permanent pull in every sense against costly precautions, and in spite of that permanent pull I am glad to think that owners do take precautions; but it is obvious that it must be an advantage to have that pull removed.

12,240. It is a very serious assertion even to suggest it?—It is a serious subject.

12,241. I put it to you that it is an untrue suggestion to make?—I am interested to hear you say that, but the fact remains that as many as the whole of the casualties in the Gallipoli Foreo took place last year in the coal mines.

12,242. There are 1,100,000 men engaged every day in the year?—That is true; and 160,000 of those were unable to work for several days because they were so seriously injured.

12,243. How do you suggest that the trams would be better run under a nationalised system?—May I again fall back on the Home Office Report: "The proceedings against the Agent and Manager of Dowlais Colliery for failing to comply with Section 43 (1.a) of the Coal Mines Act, reported by Mr. Dyer Lewis on page 57 are of particular importance. I fear managers and others generally do not realise that the provisions of the sub-section in question as to the provision of a clear space of at least 2 ft. in width between the tubs and the side of the road means a space free from any obstruction. If flanges of pipes buried beneath the surface of the space provided protrude up through the floor in places,

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

even to the extent of 2 inches, the clear space required is not provided, and persons other than those specially mentioned cannot be allowed to travel on foot when the haulage is in motion. The object of the proceedings"—was not to convict the person, you will notice—"was to impress upon managers the requirement of the sub-section, and this was obtained by the course the Stipendiary Magistrate took in dealing with the case." You will still notice that the Home Office felt it necessary to take a case into Court, not because they particularly wanted to convict the persons—as a matter of fact, it was eventually dismissed on payment of costs—but in order to deliberately impress on managers and others concerned the necessity for keeping this clear space.

12,244. Do you assume from that that managers have not been doing their duty because of a profit-making incentive?—I should not like to impute the motive. It is quite clear that managers had been a little inadvertent in the matter in the judgment of the Home Office.

12,245. Would they be less inadvertent under a nationalised system?—I suggest if they had not this desire to pull the profit for their firms they would not have deflected so much. It does not require any proof. If you have a permanent pull in one direction and you can get rid of that permanent pull you will alter the course.

12,246. Do you not think it possible that a pull in some other direction might affect it?—That is always possible, but that would not affect the truth of what I have said.

12,247. Are you aware that the majority of accidents on tramways took place because the men did not take advantage of refuge ways?—I have heard the same thing said with regard to children being run over in the streets. You have to allow for a certain amount of human nature, and you have to take your precautions for the accepted human nature.

12,248. Would that human nature be altered if you have nationalisation?—No, but precautions would be taken that are not now taken.

12,249. Are you aware that in forming the general regulations the owners suggested that there should be an obligation on the men to use the safety appliances that existed and that that was resisted?—I was not aware of it, but it does not surprise me.

12,250. Do you not think it follows that, although you can make the provision of safety appliances compulsory by law, you cannot make the taking advantage of them compulsory?—That is true. May I say what a very important inference can be drawn from that? In this case of the defective timbering the workmen were, if they required timber, to draw it from the waste or other disused places—that is to say, more than 10 yards. Now, if you impose any irksome job on anyone—in this case illegally—to make him draw his timber from a longer distance than the Act requires, it is inevitable that in a certain number of cases the timber will not be drawn, and that is why you have to have such regulations.

12,251. Are you aware that at that time the Home Office were impressing on them the necessity of economising timber?—What the Home Office said was: "Proper economy in pit timber is undoubtedly a matter of pressing importance, and there is no objection to the withdrawal of timber in such a manner and to such an extent as is consistent with safety, but the provision of an adequate supply at the working places, as required by the Coal Mines Act, is still more important as being essential to the safe working of the mines. Economy can and must be practiced without infringing this Act, and endangering the lives of persons employed in the mines." What the Home Office found was that under a mistaken patriotism the owners were economising in such a way as to infringe the Act.

12,252. Then would you eliminate the mistaken patriotism?—Yes, I would have prevented a mistaken patriotism which economised in timber at the expense

of men's lives. May I remind you that as a matter of fact the number of men killed by falls of roof went up to 733 that year as compared with 645 for the average of the five preceding years? If the economy in the use of timber led to the death of those 88 extra men and the maiming and crushing of a great many more, it seems to me that that was a very bad instance of the perversion by this permanent pull.

12,253. This was during a period when there was State control of collieries?—There was no more State control of collieries than under the Coal Mines Regulation Act in that respect.

12,254. There was financial control?—There was financial control, but you know nothing can be worse than bureaucratic financial control over a profit-making industry.

12,255. You suggested that it is necessary to bring all the coalfields up to the standard of Northumberland and Durham?—I only said if we could do that we should save 300 or 400 lives a year. I said that was a desirable thing to be aimed at, but I did not commit myself to the statement that it could be done.

12,256. It points in that direction?—Yes, it does.

12,257. Do you suggest that the number of accidents in Northumberland and Durham are due to their higher standard?—I have suggested that some of the superiority with regard to the number of accidents is due to geological conditions in all probability as compared with South Wales.

12,258. Is it not due entirely to that?—I hesitate to think that the number of shaft accidents can have anything to do with geological conditions.

12,259. Are you not aware that the shafts are very much deeper in South Wales than they are in Northumberland and Durham?—I am afraid that the smaller number of shaft accidents is not due to the shaft being softer to fall into in South Wales. After all, 100 feet is enough, and you do not make it any greater by falling 500 or 600 feet.

12,260. That is not my point?—Then I do not understand it.

12,261. A deep pit may be more dangerous than a shallow pit?—It may.

12,262. You do not know whether it is or is not?—I should say it is sometimes.

12,263. And a large number of small pits may be more dangerous than bigger and better equipped pits?—I think that is very likely, especially as regards the better equipment.

12,264. You are aware that in South Wales there are a large number of small pits?—Yes. I have always understood that the coal industry of South Wales was not a well-organised industry.

12,265. You must not assume that without knowing the facts?—No; but I was taking the facts.

12,266. Are you not aware that the small collieries are performing a very useful function?—No; I can not say anything for or against them in that respect because I do not know.

12,267. But you do condemn the industry because there are a large number of small units?—Yes. *Prima facie* an industry with a large number of small units will not be so efficient as an industry with large units.

12,268. You do not know why there is such a large number of small units?—No, I do not.

12,269. If I told you that for that reason it could be worked on a better scale, would you agree with me?—No, I do not agree at all, because I do not know the way the coal should be worked. I do not think it is desirable to work coal in any particular year which is below the common quality.

12,270. Do you suggest that these small collieries are worked at a loss?—I do not know.

12,271. Do you not know that these small collieries are worked at a less cost per ton than the large collieries?—No.

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

12,272. I thought you did not. You have been condemning without knowing the facts?—No, I have not at all.

12,273. With regard to the continuity of working from the point of view of the export trade, do you suggest that it is possible to keep collieries going that are dependent on the export trade by any system of stocking at all?—Yes.

12,274. Take the case of the South Wales collieries with an output of over 100,000 tons of coal a day shipped, and the coal is sent down to the docks to await ships coming in; bad weather comes along and ships do not turn up—how do you suggest that that coal should be dealt with?—One way in which I think it must not be dealt with is to deprive the miners of their food for the days in question.

12,275. I am asking you how it should be dealt with, not how it should not?—I am arriving at it by a process of elimination. There is a way that is obviously a wrong way. You should no more deprive the miners of their wages for that day than you would deprive the clerks in the office of their wages or the horses in the pit of their food. I will now proceed. Surely there is such a thing as stocking, even for exports. I have heard of stocks at the ports, and I suggest that that might be carried a little further.

12,276. By the provision of more wagons, do you mean?—By the provision of more places for keeping the coal, of which wagons might be one, if wagons is the cheapest way.

12,277. You suggest, therefore, that there should be a sufficient number of wagons employed in the trade of South Wales to provide storage to enable the collieries to work regularly throughout the winter, bad weather, delays to tonnage and everything else?—I did not say wagons. I said wagons or some other method of storage. I do emphatically suggest that there should be a sufficient storage to enable the collieries to work with continuity, and I do suggest that that would be, though not to the individual colliery owners, because they would naturally not like to incur the expense of stocking; but it would be economical to the community, because they would get continuity of working.

12,278. Do you suggest that that is a point on which practical knowledge is not of value?—I always welcome practical knowledge when I can get it.

12,279. Can you suggest any means by which South Wales large coal can be stocked to the extent of 100,000 tons a day?—What is the difficulty of stocking 100,000 a day? It does not appear to me a difficulty.

12,280. What about the labour?—It does not cost any more to stock 100,000 tons than it does to stock 10 tons 10,000 times. It probably costs less.

12,281. Do you suggest that there should be sufficient men kept for an emergency of that kind?—What I imagine is that there is a regular system by which the coal is sent down from the pits day by day, and I see no difficulty in that coal, instead of being put on board ship, being put where it is to be stocked, the same amount every day.

12,282. The same amount sent down?—I did not commit myself to the method.

12,283. I am afraid you are committing yourself to nothing?—I am not called in to advise the South Wales Collieries how to do it.

12,284. But you condemn the present method?—Yes.

12,285. And you suggest nothing better?—I think I have suggested something better.

12,286. You have suggested it in a very vague way?—I should be quite willing to be called upon to advise on that subject.

12,287. I think if you could advise as to some means the South Wales coal owners would be very willing to pay you very handsomely?—You remember the professor who said to his class, "That way there is money to be made; go and make it if you like; we will go on with something else."

12,288. You seem to imagine that there is no comparison of methods of working and cost of production between one colliery and another at the present time?—So far as they are in separate ownership I believe there is next to no comparison.

12,289. May I suggest to you that that is entirely wrong?—I am quite willing to receive the suggestion.

12,290. If that is wrong is that another assumption?—I only said I received your suggestion. I want to be shown how it is wrong first.

12,291. If I suggest to you that in every colliery of the district there are institutes of colliery engineers where the fullest discussions take place, what would you say?—I have read their reports and a number of the papers read in the Societies of that kind—not by any means all, of course, but I have read a number, because I was rather interested in the professional organisation. I read a number of the papers and proceedings, and they are very interesting; but if you think that is anything like the scientific comparative costing which is very much practised in American trusts and combinations and has been introduced into this country, I am sorry to say you are mistaken.

12,292. I am not suggesting anything of the kind. I am simply suggesting that you have gone further than the truth in suggesting that at the present time there is no common knowledge as to the amount of coal being raised?—That is so. There is certainly no common knowledge, even in the Home Office, of the amount of coal being raised each week. They do get the totals for the past year.

12,293. Would you be surprised if I told you that in the Coalowners' Office at Cardiff there is an accurate record every week of the coal raised?—My point was the Kingdom.

12,294. If it can be done under private ownership in a district, do you think there is any difficulty in it being done in the Kingdom as a whole?—I did not suggest that it could not be done. My statement was that it was not done.

12,295. For the Kingdom as a whole?—Yes.

12,296. As a matter of fact it is done by the Coal Control?—That rather proves my point, that under a system of private enterprise it was not done. If the Coal Controller comes along as a Public Officer and does it, it only shows the fact that private enterprise was proceeding without that knowledge.

12,297. Is it necessary to nationalise mines to bring about a return of that kind every week?—No, I was not suggesting that it was. I was only suggesting that private enterprise at coal mines is extremely inefficient, and I mentioned that as a proof.

12,298. Does that not prove that private enterprise has done more than public departments have done?—No, the statement is not proved by that assertion.

12,299. The fact remains that private enterprise has done this and a Government Department which ought to have done it has not done it?—Pardon me, I do not say a Government Department has not done it at all. I merely made the assertion that private enterprise has been proceeding without a knowledge of what is going on in the business all over the Kingdom. I did not suggest that it was the business of the Government to have that knowledge. I only pointed out that the private owners were doing very badly in the matter.

12,300. I thought you did complain that the Home Office had none of these particulars?—I may have done so.

12,301. That something, you say, that ought to be done by a public department has been done by private enterprise?—I do not admit that what I am talking about has been done by private enterprise, and I also do not admit that what I was talking about has not been done by the Home Office. The mere fact that something else has been done by the Home Office seems to me not to disprove my statement.

12,302. I am afraid I cannot follow you in the niceties of dialectics. I think you have me there every time?—I was only pointing out in that statement that it is one of the essential elements of competitive enterprise among 1,500 separate concerns that there should be a lack of co-ordination. It is a defect

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

of the quality of competition—it cannot be helped—that if you were to get all that information you would be dispensing with competition. It is for that reason that the Chairman's Report has convinced the Government that we must have either unification or nationalisation.

12,303. Do you suggest that the Government were convinced by the Chairman's Report on its merits?—I have no doubt about it.

12,304. Was it not your view that the stopping of the strike was the main object?—Surely that was part of the merits. The effect on the minds of the miners is an important element. It is only because private enterprise has led to a neglect of that important factor that there have been difficulties.

12,305. It was the effect of the Report in stopping the strike, and not its merits in any other direction?—Possibly.

12,306. I have one question to put to you on compensation. Do you think the comparison with the liquor trade is a fair one in assessing compensation?—I think so. I do not want to be derogatory to either industry, but as a matter of fact I have pointed out that what is compensated for is not the coal or the alcoholic drink, but the established expectation of being able to draw an income, and it is that which the State interferes with, and it is for that that compensation is due.

12,307. Do you think it fair to make a comparison between a trade that a good many people think ought to be suppressed altogether and an industry like the coal industry, which ought to be continued and expanded?—I can only say if I were an arbitrator that I should not allow that to influence me by a single pound in any direction, because I should not compensate for the coal or the drink, but for the disturbance of established expectation of income.

12,308. You suggest in your pamphlet that it is possible to get by nationalisation a uniform price all over the country?—Yes, I think so.

12,309. All over?—Yes, for domestic coal.

12,310. Ireland?—You could include Ireland if you like. I had not contemplated that.

12,311. Shetland?—Sbetland, yes—St. Kilda. There is exactly the same means of doing it as there is in conveying a parcel to those places, and you have to make exactly the same assumptions before you are justified in doing it.

12,312. Would you put up the price to the man at Chesterfield in order that the man at St. Kilda should get it at the same price?—No, I have carefully explained that it would not be putting up the price to anybody from what he is accustomed to pay.

12,313. Would it not mean a considerable allowance in one case, or a raising in another, if it is to be uniform?—I think not.

12,314. You think it is the same as it is with postage stamps?—I think it would be a great convenience, and there is quite good justification for regarding coal as a public service, just as the sale of postage stamps is a public service.

12,315. Do you suggest that the miners should still get their coal free or at a nominal charge?—Yes, as they do now. I am a conservative person. I never propose to alter more than need be.

12,316. So that you would put the miners in a privileged position with regard to all the rest of the country, although you set out to get a uniform price?—May I explain? It has been found for 2,000 or 3,000 years expedient to be lenient to the people who are actually working. "Thou shalt not muzzle the ox that treadeth out the corn." I always think of that as a leading case, and that is a matter of convenience.

12,317. Would you sell postage stamps to the employees of the Post Office at a cheaper rate?—I think in that case the question of administrative convenience does not come in, but if it did I should certainly consider it. We do not find it convenient to muzzle the ox.

Mr. Robert Smillie: We did not hear very distinctly on this side, and I thought Mr. Evan Williams put it to Mr. Webb that, as a matter of fact, the Government did accept the Chairman's Report in order to stop the strike. If that is the assertion,

then I would ask Mr. Williams to go into the box in order to prove that.

Mr. Evan Williams: I asked Mr. Webb.

Mr. Robert Smillie: I thought you put it as a fact.

Mr. Evan Williams: No, I asked the question.

Mr. Robert Smillie: I thought you followed it by saying that as a fact it was so.

Mr. Evan Williams: No, I am not in a position to say so.

12,318. *Mr. J. Forgie:* Mr. Evan Williams has gone over the ground so thoroughly that I have not very many questions to put to you. You do not seem to be so conservative of some interests as you are of others. You are willing to conserve the privileges that the men have at the present moment because it has been going on for a long time, but you do not seem to be willing to conserve the coal trade to the coalowners?—I should be very sorry to take it away from them without giving them fair compensation. I do not boggle at the amount.

12,319. You are here giving evidence in favour of nationalisation of the coal trade?—Yes.

12,320. I would like to ask you—I think you have answered the question already—if your mind is absolutely foreclosed to the consideration of any other system of carrying on the coal trade except nationalisation?—Certainly not. I try to keep an open mind, and to learn from day to day, and I hope I do so.

12,321. Is your mind absolutely foreclosed to private ownership?—Oh dear no. We must necessarily rely on private ownership for many things; therefore it must be regarded as a possibility.

12,322. Private ownership is, of course, impossible without profit?—Very likely. I should not necessarily have condemned it in that way, but it may be so.

12,323. And you are absolutely against profit making?—No. I merely suggested that it was a rather low and corrupting motive, and that there were better motives on which we might rely increasingly; but, of course, we are all strangely mixed, and I do not say we can entirely free ourselves from profit making.

12,324. Do you attribute the whole faults of the coal trade, as you bring them out, to profit-making?—No; I think that would be unduly seeking to uniform everything under one head. I think that a large part of the lack of organisation is due to private ownership and also to a feeling that competition was the best method of carrying on the industry. I am surprised that the owners have not discovered the advantages of unification before.

12,325. Probably it may be that the owners have been too patriotic?—It may be that they were too patriotic; but all those who attempted to combine all down the ages were less patriotic than the others.

12,326. The coal trade has made great progress and has increased the output of the country and met the whole demand?—Yes, I think we may say that some people have gone short of coal at times.

12,327. Very seldom, I think?—On the whole, less often than not.

12,328. I think the coal owners, under private ownership, have met the demand of the nation with regard to coal?—Yes.

12,329. And at the same time they have supplied very cheap coal to the consumers?—That is a matter of degree.

12,330. At all events, they have supplied the quality and the quantity that each consumer wanted?—Yes, on the whole, certainly.

12,331. Of course, it may be that there were questions of transport, but still the consumer had the class and quantity of coal he desired?—Yes.

12,332. Under control during the war, which, of course, we all submitted to, the consumer has not got in many cases the quantity and the quality that he wanted?—Yes. I should not ascribe that to control; I should ascribe that to the war.

12,333. We have submitted to that, of course?—Yes.

12,334. Especially with regard to quality, it was sometimes very much unsuited to his purpose?—I believe the number of cases of that sort were fewer than 5 per cent.

12,335. Much more than 5 per cent. in the district I am referring to?—Possibly.

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

12,336. Under any system of nationalisation—in fact under the system you propose here—a distribution of that kind would be brought into effect?—I do not think so. I think a system of control as distinct from public ownership is essentially different from private ownership, but still I will go to the heart of your question: there would be as an incident of the nationalisation—the distribution of coal—some attempt to direct the distribution so as to secure the lowest possible cost, but it does not follow that an individual or a particular concern who wanted a particular kind of coal would not be allowed to have it. I suggest that that concern should be allowed to have the top brick off the chimney—any particular coal that it chose, even from the Orkneys; but I would take care that it paid the whole cost of the exceptional service that it was getting.

12,337. You think that nationalisation would be the best thing for the coal industry?—That is my present opinion.

12,338. You do not think that it is possible to organise and carry on the coal industry under private ownership?—I would not go as far as to say it is not possible; I would say it is very inexpedient, and, as a matter of fact, I do not think it is politically possible.

12,339. Are not the men who have conducted the coal trade in the past as good as those who would conduct it in the future? They are human beings, and have been trained in the industry.—Yes, and I hope we shall have their services.

12,340. What difference will it make to them to nationalise, barring profit making?—The difference will be that instead of leaving themselves under the motives of profit making and incidentally, as I rush to admit, doing work of public utility, they will be seeking the public utility and only incidentally drawing their salaries. That is the difference in a nutshell.

12,341. Do you say that the workmen in a State service are superior to the workmen of private employers at the present moment?—I would say that the workman has been in a very unfortunate position, that he has been the sport of the capitalist system for so long now that it is hardly fair to take him as a test, but, even allowing for that, I am inclined to think that there is rather more sense of public obligation and public duty among the workmen who are regularly and permanently employed by the State than among corresponding workmen employed in private capitalist service.

12,342. Has that been proved to any extent?—I am afraid it is not one of those statements which are capable of any exact proof. You were asking me for my opinion, and I gave it.

12,343. I want to know whether any practical experience or any proof could be brought forward of that?—I am afraid not.

12,344. It is a hope and an expectation?—No, it is a judgment.

12,345. That a change from private ownership to State employment will bring about an entire change of mentality?—I have also that hope; but, as a matter of fact, the statement that I made was a judgment of the present.

12,346. Have there been any fewer troubles, strikes or grievances in a State service than a private enterprise?—To answer you literally, yes; I think the experience of State employment is that the number of strikes is considerably smaller than under private enterprise, because so large a number of small stoppages occur from what I will call trivial causes which ought not to have taken place. I do not pretend that public enterprise prevents all differences of opinion as to the terms of employment, but I think I may say that numerically the number of stoppages is much smaller under a public enterprise than under a private enterprise.

12,347. Political pressure may have something to do with that?—I do not understand what you mean, but if you mean that the State Department is rather more careful to listen to the claims of equity than a capitalist exposed to competition finds himself able to be, I grant that that is so.

12,348. There was a very serious strike in London lately in the Police Force?—Yes.

12,349. That is a State service?—That is so.

12,350. Do you think that the policemen should have a very high ideal of his duties?—Yes, but he is also a human being.

12,351. But still that high ideal should prevent strikes?—I do not say the policemen were altogether in the wrong. They made a forcible representation to headquarters which got attended to.

12,352. In going to this nationalisation question, is it your opinion that all industries should be nationalised?—That is rather a speculative opinion. My opinion is that when we arrive at the perfect social organisation we shall probably find that all industries are nationalised, but it will be a long while before we get there.

12,353. The coal industry you think is one of the first industries to be nationalised?—Yes.

12,354. What is your reason for that? Do you not think that it is one of the industries that should not be nationalised because of its physical difficulties?—That does not weigh with me at all. In fact, I do not think as an industry it has so many difficulties as some other industries, but it is one of the first that require nationalisation for several reasons. Its product is one the consumption of which enters into every person's life and every industry. It is very important that that product should be available with the greatest regularity, and with the least possible sacrifice. It is an invaluable national possession; the coalowners who are selling the coal are not making the coal; they are not replacing the coal; and no one has yet shown how you can, under private enterprise in coal mining, have any motive for preventing eating up the national resources. There is nothing that can be suggested to prevent the coalowners from eating it up as fast as they can. Then there is a further point, that the industry is a small one; it is in a very small number of hands; there are only 1,500 concerns to be dealt with as regards the extraction of the coal. The royalty owners are only some 8,000; and the distributing trade is not very large; and, curiously enough, you can compensate adequately all the interests concerned for less than one year's retail price of the coal.

12,355. You do not consider it a very large experiment to make to nationalise the coal industry?—No—on the scale of the experiments to which we have become accustomed it is not. Our minds have become enlarged.

12,356. Where does the financial position of the country come in?—I shall know more about it tomorrow. It is a matter of very great financial importance to the nation that we should nationalise the coal mines as quickly as possible.

12,357. No matter what might take place—whether the result would be a success or a failure?—No. Of course I am only answering according to my judgment. If my judgment were otherwise my answer would be otherwise.

12,358. Assuming after it was nationalised that it was a failure, that it did not pay its own way, and had to be subsidised from other sources, there are two methods from which it could be subsidised, either by an increased price, or a reduction in the wages?—Yes. I should imagine that, whatever the cost of working the coal is, the price will be adjusted to that cost. I do not think there is any mystery as to how the matter can be made good.

12,359. Then how could you answer Mr. Williams' question as you did with regard to one price all over the country?—That is for house coal.

12,360. I quite agree that your opinion may have changed with regard to the £1 a ton?—When I said £1 a ton I was not allowing for currency changes. It makes the price twice what it was then, and the £1 would be £2. It is not a change of opinion.

12,361. You intend in the future that the price should cover the cost?—Certainly, the price in the aggregate, of course.

12,362. Do you expect under nationalisation that you would be able to reduce the price of coal below the present price?—Really, I have not been able to form an opinion about that. The present price is

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

such an artificial entity that I cannot tell how long it is going to last. It is arbitrarily fixed by the Government, and to some extent it has relation to the high price of coal to neutrals.

12,363. You know that there is not very much profit in the coal trade?—Of course, it must vary from mine to mine. We have it in evidence that the cost of production of coal varies from as much as 6s. a ton lost to 12s. a ton profit. Consequently there must be that enormous range.

12,364. You admit that there is a very much bigger range for the export price?—I dare say.

12,365. That would affect some collieries more than others?—Very likely.

12,366. My question is, is it likely that under nationalisation, working under the same conditions as under private ownership in the past, coal would be produced at a cheaper rate?—If I were a Minister having to steer this through the House of Commons I should be extremely careful not to hold out any expectation of a reduction in the price of coal, because I should not want it to be quoted against me in the future. I want to live a few more years after nationalisation and I shall be very careful not to hold out a hope of a reduction in the price of coal.

12,367. I quite agree with you, but is it not in the interests of the consumer and the nation that we should find some means of getting back to the old price of coal?—Yes.

12,368. Is it not likely if the present price of coal is maintained that in the future other industries in the country will suffer very materially?—Really, I do not think so.

12,369. At the present moment you know that this country is having great difficulty in getting orders for its manufactures?—May I say that a great many countries in the world are not giving orders?

12,370. Orders are being giving which are going past this country?—Yes, I have heard that stated for the last 40 years.

12,371. In fact Birmingham has been importing steel rails from America?—And I have heard that for 40 years.

12,372. I do not know whether there was a difference in the price 40 years ago compared with the price at the present moment?—I really do not know what the difference was.

12,373. If it was found that the present high price of coal had an injurious effect on the industry, and in fact stopped industry, and the coal mines were being run by the nation, what would be the method adopted by the Minister of Mines to try to make the supply of coal at a cheaper rate?—I really cannot foresee; but I do not imagine that we should give a subsidy to any industry by letting them have specially cheap coal.

12,374. If the price is reduced it must be found from one of two sources. It must be found by taxing the people or the industry being subsidised in some way or other?—Yes. I should not propose to subsidise the industry. An industry which cannot exist without being subsidised is not very profitable to the nation.

12,375. Then you take up the position that whatever the cost is the price must be made to cover the cost?—I think so.

12,376. Therefore the nation cannot possibly sell the coal at a cheaper price except by reducing the cost?—I think that is so.

12,377. With the uncertainty of the future, do you think it advisable still to nationalise the coal mines?—Yes.

12,378. Do you not think it better to wait for a more favourable opportunity?—It is because of the uncertainty that I think it is imperative to do it at once.

12,379. Before nationalising the coal mines, or before deciding upon nationalisation, would you agree that the Commission ought to ascertain on the balance of evidence whether the industry so nationalised will be run at a profit, or will have to be subsidised?—That is a subject on which evidence cannot be given.

12,380. Supposing the coal trade is nationalised, and you find afterwards that it cannot pay its own way,

what would be your remedy?—Pardon me, I cannot contemplate it not paying its own way, because the price will have to be fixed in relation to the cost. I cannot imagine that the coal industry is going to be subsidised out of the taxes. The price would have to be fixed to cover the cost in the aggregate.

12,381. *Sir Arthur Duckham*: A lot of the discussion that has taken place has not been clear to me because I am not quite clear of the definition of some of the words used. One word has been used quite a lot that I should like to have a definition of and that is the word "profit." What is profit in your mind? How do you use the term "profit"?—I use the term "profit" to mean what is taken by the entrepreneur as the difference between the outlays he has to make in all directions to carry out his enterprise and the net price or proceeds that he gets for the product of the enterprise, and that difference that we may call profit incidentally serves for his remuneration.

12,382. So you would not call anything a profit that is obtained, may I say, without capital? Take the case of a man who gives his services—he cannot make a profit by giving his services?—I think that is so, by definition.

12,383. You would say that?—Yes.

12,384. Then what does "capital" mean? May I put it this way, to show you my difficulty: Say that this man has made money, and he does not spend it, and he has money to spare: is that money capital if he invests it in any concern?—It depends on the application. Assuming that he invests it, as it is called, I think you may fairly say it is capital.

12,385. And he becomes a capitalist?—To that extent.

12,386. Therefore he becomes something to be avoided, if I may say so?—Oh dear no!

12,387. And also a man without brains?—I hope not. We are all more or less capitalists in that way.

12,388. You do not propose to prevent people from becoming capitalists?—In that sense, no. My notion of a socialist State is that there will be a great deal more private property than at present, because it would be owned by ten million families instead of by a comparatively small number; therefore in the aggregate there would be much more property owned privately, only it would be in more equally distributed lumps.

12,389. You would agree that it should have a reasonable return on it?—I do suggest that in so far as it is necessary to induce people to save by giving them a reward, such a reward should be given in the form of a rate of interest.

12,390. You would give them a reasonable rate of interest?—I would give them no more than is necessary for the purpose.

12,391. Then that is governed by the purpose?—Yes.

12,392. You are in agreement that it should have some rate of interest. We have had it stated that the rate of interest on the average in the coal industry before the war was not unreasonable?—I do not think I should like to say that.

12,393. Would you consider 9 per cent. unreasonable?—I certainly consider it is unnecessary. I do not venture to suggest that it was more than was necessary to attract capital to the industry under the present system of private ownership and disorganisation in which the industry is, but I think it is more than would be necessary to attract capital into the industry if it were properly organised under a public system; therefore there will be a very considerable saving under nationalisation in the rate of interest, and that is one large source from which any possibility of a rise in prices would be prevented.

12,394. I am only too glad to know that you do not object to my making money. Do you really consider that Government departments are run as efficiently as ordinary good commercial concerns?—I do not consider that they are run as efficiently from the point of view of making profit.

12,395. From the point of view of output from the office?—I do not consider they are run as efficiently in the way of output from the office, measured in

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

the way of work done. What I say is that they are run more efficiently than other enterprises of a like nature when you take into account the objects they have in view.

12,396. I take it that you are not speaking from practical experience?—Yes, I am.

12,397. Have you controlled any large Government department?—I have never controlled any Government department. After all, only a Prime Minister can do that.

12,398. Have you ever been in charge of a Government department?—Never.

12,399. Have you ever been in charge of a business?—No, thank God!

12,400. Will you take it from me, who has been in charge of a Government department, that I do not think a Government department is run as well as a private enterprise from the public interest?—I am interested to hear you say so.

12,401. You have spoken about workmen in Government service. I take it what you say is a matter of opinion?—Yes.

12,402. On this question of housing, you would not suggest that it is possible to divide the housing of the miners from the general housing of the country; it must go through together in a general scheme?—Yes, certainly. You can only deal more or less with the mining districts.

12,403. If you assist the housing from the coal industry, it is a charge on the coal, however you do it?—In a sense.

12,404. The 1d. tax is a charge on the coal?—Certainly.

12,405. If you take it out of the royalties, it is a charge on the coal?—In that sense I would agree.

12,406. With regard to the question of safeguards, I would submit to you, and I think you would agree with me, that the safeguards taken in regard to the gas undertakings of this country are not delusive. I am speaking of the sliding scale?—A certain number of the gas companies work under the sliding scale clauses, and I think that is one of the most effective checks that has been devised, but it must be noted that it is only applicable where the product is standardised to one quality practically. I cannot imagine how you would deal with the engineering industry on that basis. It also involves an absolute control over the capitalisation. No one is allowed to put money into a gas company just as he likes or as the directors like; it has to be done in certain ways which are watched over by the Gas Auditor. Then, of course, it is an absolute bar to any watering of the stock; that is not allowed. Then a certain criticism has been made as to the economic effect, even of the gas clauses, in the encouragement of a certain extravagance or discouragement to economies at certain points of the scale.

12,407. From a general point of view, that is a workable system?—Yes.

12,408. It has broken down during the war, but it has worked well, and there is a possibility for a scheme of private management, and yet in some way controlled?—Yes, that is quite the most promising form which I have ever yet seen it take.

12,409. I am glad to see that you are more specific in your evidence than you were in your proof with regard to the pit committees. There you state that

the pit manager is responsible, and has a final word, except as far as referring to his chief is concerned? I think that is inevitable.

12,410. It is not quite clear here. With regard to this matter of safeguarding the consumer, it is not so much with regard to the household consumer that I am worrying about, because coal does not vary so very much for this purpose, but it is the industrial consumer where the specific coal is absolutely essential to him. How do you safeguard him in your scheme?—I think the only question arises in so far as the coal administration directed the distribution. In so far as that has to be done, or it is desirable that it should be done for the sake of economy in haulage, it seems to me that it would be quite possible to allow any particular consumer to have his fancy in the form of coal on equitable terms; that is, that he should be required to pay what might be estimated as the extra cost of the disturbance of the system.

12,411. If I were an ordinary consumer in London, I should get my coal at a fixed price—that is my suggestion—but if I were an industrial consumer, I might have to pay extra for it?—I think if you were an ordinary industrial consumer and were supplied on the general system, that you would find that you were getting it for less than the domestic consumption; but supposing you wanted some particular brand that could not be given you in the ordinary way, then I am afraid one must ask you to pay whatever cost was involved to the system in putting itself out to meet your convenience.

12,412. You would give your consumer the right of choice?—I would.

12,413. With regard to stocking, you have no experience, I take it, of stocking coal?—No, I never stocked more than five tons.

12,414. I have stocked several hundred thousand tons. You have no idea what it costs to stock coal?—I have not.

12,415. Would you consider that it would be against your scheme if it cost more than a shilling a ton for actual handling?—No, I should not; a shilling a ton strikes me as moderate.

12,416. I give you that as a figure, apart from the other charges?—Yes.

12,417. You realise the great danger of coal fires in stock heaps?—Yes; it varies from quality to quality.

12,418. And also how you stock it?—Yes, how you stock it.

12,419. It is a great danger, is it not?—There is, I believe, a large amount of stocking at present. It is not a novel expedient. I have seen large mountains of coal in different parts of the world.

12,420. Poor coal or stocked coal?—Stocked.

12,421. I should think they were in Germany?—No, I have not been in Germany for some years.

12,422. With regard to standard coal, you are not an upholder of standard coal, are you?—No; I do not understand the qualities of coal, but I have learnt that there are a great many more names than there are qualities.

12,423. You are not suggesting that you should mix qualities of coal to obtain the standard?—No, I have never suggested such a thing.

Sir Arthur Duckham: I am glad your theory runs with my practice in that matter.

(Adjourned for a short time.)

12,424. *Sir Allan Smith:* I am rather distracted at your evidence for this reason. I cannot make up my mind as to which is the consideration of greater importance in the position that you take up; either nationalisation from political standpoint or social economic standpoint, or nationalisation on account of the various considerations which you refer to, namely, housing, infantile mortality, prevention of accidents and unification of costs; which is it?—I am afraid I am not able quite to answer. I think all those considerations come in. I take it the final consideration, the biggest consideration, must be the probable effect on the life of the nation, and it is

very difficult to say how far there is one influence rather than another. I should certainly lay most stress on what I call the social effects on the standard of life of the people concerned, rather than upon any monetary advantage. I think the monetary advantage must be allowed to come in.

12,425. I do not know that you quite understand the point I am making. You have stated definitely you are a democrat?—Yes.

12,426. You have also stated in your *précis* that there is thus politically no alternative to national ownership?—As between unification and national ownership, yes.

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

12,427. Unification involves a certain amount of private enterprise?—Yes.

12,428. Therefore, from a political standard or social economic standpoint, you are in favour of nationalisation?—Yes.

12,429. Is that the major fact? Is your determination more influenced by the various points you have raised as a group, the housing accidents, infantile mortality and cost?—Really I find it very difficult to assess the different values. I would suggest a great many of the monetary advantages could be gained by mere unification; but, as against that, there is first of all the political objection that a national coal trust would be so injurious, or thought to be so injurious, as to be impossible; and, secondly, that I do not see that a national coal trust would have any other motive than the individual colliery owners with regard to housing, accidents and infantile mortality.

12,430. May I put it this way, that *prima facie* your view is that nationalisation is wise, and from the point of view of the coal industry you seek from the details of the points there to select certain considerations which you think would justify you in applying your general principle of nationalisation?—I think I would rather say that I have endeavoured to adduce facts and considerations which seem to me to support the general argument. I hope I have not selected them unfairly.

12,431. Not by any means; I do not suggest that. You object to unification without control?—Yes, certainly.

12,432. I suppose that applies to the coal getting as well as the coal distribution?—Yes, I think so.

12,433. If that is so, why do you suggest that the coal distribution should be offered to the Local Co-operative Society?—Because a Co-operative Society has no profit-making inducement; any profit it makes must by the very nature of its being hand back to the consumer as a discount on price.

12,434. Let us be quite clear. You object to anything in the nature of a monopoly that is not Government controlled?—No, all I say is, a monopoly that is not publicly controlled.

12,435. What do you mean by public control?—There are three forms that work in this country: (1) the National Government under the control of the House of Commons; (2) the Municipal Government under the control of the local ratepayers; (3) the Co-operative Society under the control of the community of consumers.

12,436. Let us examine the last, which is the one we are referring to. The co-operative control under the jurisdiction of the superintendence of the consumers approximates very closely to the private enterprise subject to the jurisdiction of the shareholders?—

With this very extraordinary difference, that the shareholders' interest is to get as large a dividend as possible, and therefore to put the price up as far as possible, whereas the co-operative members' motive is first to keep the price down low because they pay it and then to restore all the margin to themselves not in the proportion to the capital they have at stake, but in proportion to their purchase; it is a mere discount on price; therefore it is not unfair to say the co-operative members, although twice removed are always induced to keep the price as low as possible, whereas the shareholders have a particular inducement to keep it as high as possible.

12,437. Is it not the case in the long run that the co-operative wish to see the dividends on their purchases and the shareholders wish to see their dividends on the investments?—Yes, that is so. The dividend in those cases is as different as chalk from cheese and only resemble each other in the name.

12,438. We must admit income is income. It is what comes into the receipt of the individual who receives it?—Yes.

12,439. Whether he gets it by way of kind or cash, surely that does not matter?—That is so.

12,440. I assume you agree the shareholder is entitled to remove a director who is not making profit for the company?—Yes.

12,441. And that your co-operator is entitled to remove a manager who is not doing the same thing?—Making a dividend for the consumers, yes.

12,442. Therefore, when it comes to bedrock, the underlying principle which actuated the co-operator is the same as the underlying principle which has actuated the shareholder?—It may be stated in that way. There is the very essential difference that the larger the dividend to the shareholders the worse, other things being equal, for the community; the larger the dividend for the co-operative members, the better, other things being equal, for the community.

12,443. Yes. Of course, that is a matter of argument, probably. You agree with me, I think, from what you said, that the main principle, the bedrock principle, which dominates the one equally dominates the other?—Yes.

12,444. If that is so, do you think it is wise to embark on such an extraordinary experiment as unification without sufficient data?—I think it is still more dangerous to embark on the extraordinary experiment of making no change.

12,445. I do not suggest that for a moment. I quite agree with you, because we cannot stand still; we must either advance or go back?—Yes.

12,446. Supposing you disagree with any organisation of the community, is it not wiser to take part in that organisation and see if you can put it right than to scrap that organisation with its experience behind it and start something new for which there is no data?—I do not think you can lay down that as a general principle. In my consideration the organisation which exists has so many fundamental defects in its very nature that no improvement that you can see would sufficiently ameliorate it, and the wise course would be to throw that organisation away and use your experience of the past—you never throw away your experience—to construct a better organisation.

12,447. Surely you have already stated that it may be that in certain forms of unification a very great amount of progress would be made?—A far larger amount of profit would be made, not necessarily progress, for the common profit of the shareholders.

12,448. It would depend upon the nature of the unification whether that profit went to the shareholders or the community?—Yes, but unification as such would increase the profit for the shareholders.

12,449. I suppose you agree that monopolies are not wise?—Monopolies in private hands are very injurious. Monopolies in public hands may be, and I think frequently are, the very best method.

12,450. Have you any experience of monopolies in public hands?—Yes.

12,451. What?—The Army.

12,452. Might I suggest that there is no comparable factors?—Pardon me. For a very long period of time the Army used to be a matter for private contractors. Wars were waged by contractors in return for sums of money for their own profit. Eventually it was found not to be a good system. The Army was nationalised and nobody proposes to go back. Curiously enough the art of war has enormously improved and the development of initiative and invention have so far transcended any periods during the era the Army was carried on for private profit as not to be comparative.

12,453. I do not propose to follow you in that argument. Have you any experience of the activities which the Government has undertaken in manufacturing in this country?—I cannot say I have personal experience; I have not had to do with them.

12,454. You know the Government have certain arsenals and dockyards?—Yes, also certain sulphuric acid works.

12,455.—They are there presumed to compete with private enterprise?—Yes.

12,456. Do you think the advantages for nationalisation have been demonstrated in any of those experiments?—Yes, abundantly. Take, for instance, the manufacture of sulphuric acid which was lately undertaken on a large scale by the Government.

12,457. Will you distinguish between war and peace?—I cannot. Our experience has been so largely under war. It does not affect the quality of the sulphuric acid or the cost of production. The Government production of sulphuric acid has been carried on, as I understand, from such factories as were available at a very much greater advantage

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

than the manufacture of sulphuric acid under private enterprise.

12,458. What do you mean by much greater advantage?—In this case at much lower cost, but much more advantageous to the people concerned in the manufacture.

12,459. Do not you understand if you are manufacturing *en bloc* you can lay out your factories in a way that will reduce the cost of manufacture, and in a small manufacture you cannot?—That is certainly true. That is a very valuable argument for unification of industry. As a matter of fact, some of the sulphuric acid factories in private hands are themselves large. It is not a comparison of small plants with large plants.

12,460. With regard to the question of cost. Do you know anything about the peace-time arrangements with regard to the Government establishments with regard to cost?—There has been no scientific costing system at work in the Government factories until a few years ago any more than in private enterprise in this country, as far as I know.

12,461. The question of unification does not follow as a necessary consequence of nationalisation. The Government would have to make up their methods to apply the result of experiments in private enterprise in the matter of costing?—Certainly. A Government would, I presume, apply all available knowledge, a large part of which is accumulated under the system of private enterprise.

12,462. Do they do that now?—I believe they do not—but as a matter of fact they do to a very great extent in the manufacture of munitions and so on, so that the private enterprise has learnt an enormous amount in the way of working with regard to cost.

12,463. Do you suggest nationalisation should be carried forward on the basis of the war experience and not the basis of peace experience?—I consider it should be carried on on the basis of all human experience, all knowledge and all science.

12,464. Do you think you will find so many private individuals would continue in these Government Departments?—I happen to believe that a great deal of them, especially the men who came in from private enterprise, have not been successful. It has been a very bad failure on the part of the Government. I am not blaming the Government; they could not do otherwise. The business man has not been a success generally in Government Departments during the war, in my opinion.

12,465. Is that on account of the weakness of the business man or the weakness of the Government?—Fundamentally I think it is due to the fact that he got into a new climate. He had been brought up to act on the profit-making methods. When he has to take into account national considerations he is at sea. Added to that, he is, unfortunately, very much of a rule of thumb man. Many have despised theory and neglected science, and I am afraid it has not been successful.

12,466. Have you any idea who was responsible for the running of the Ministry of Munitions?—Its activity was so manifold that I cannot give any answer to that.

12,467. Have you examined the personnel of the Munitions Council?—No.

12,468. You do not know how many business men were there?—No, I do not remember.

12,469. If I say it was entirely composed of business men, what would you say?—I should not be surprised.

12,470. You admit the business man was quite out of his element and has been a failure in Government administration?—I was speaking generally; I would not say that of all the men. I say if you asked any impartial outsider who knew anything about the facts as to what he would say as to the relative qualities of the business men who had come into Government organisation during the past four years, and let me say the University Professors who have come in, I think you would get their answer that the business man on the whole had not been so much of a success as the University Professor, which is rather curious.

12,471. It depends entirely upon what the business

was and what the Professor was expected to do?—That is so.

12,472. The business man, I suggest, did the work and the University Professor made the reports?—The University Professor probably provided the science.

12,473. After the work was finished?—I think sometimes it was the work had to be done before they went to the Professor?—Eventually the Government got science to work to the greater advantage of the business enterprise.

12,474. We will leave it at that. With regard to the question of accidents, you have suggested that it is cheaper to compensate for accidents than to avoid them?—I have said that is so usually.

12,475. You have indicated there is always that element at the back of private enterprise that it may be cheaper to compensate than to avoid?—Yes.

12,476. What does the compensation to the miners cost?—I have forgotten the figures. It turned out much less than the mine owners anticipated.

12,477. If I were to say that in 1913 the total compensation to miners—I admit it includes other mines than coal mines—was £1,350,000 odd and in 1912 £1,185,000 odd, would you accept that?—That is about £1 per man per annum.

12,478. About 25s. Would you suggest that the precautions which are desirable to be taken in the interests of safety would not be met by an annual expenditure of about a million and a quarter?—I cannot really give you any useful opinion about that. I do suggest it probably would be desirable to spend more than a million and a quarter per annum in additional safeguards. I think that would have its dividends in a diminution of accidents. Obviously no estimate on my part would be of any use.

12,479. You agree that a million and a quarter spent in safety precautions over and above what has been installed would be a very important element?—Yes.

12,480. Have you found that private enterprise in other industries has fallen short in providing the necessary safeguards?—Certainly; very badly indeed.

12,481. To what industries do you refer?—I may remind you of the docks. It is a very singular thing in my opinion that the docks made so little precaution against accidents until a few years ago when they were brought partly under the Factory Act and compelled to make some such provision.

12,482. Have you any reason to think those provisions have not been carried out?—I have no knowledge on the subject. I feel sure they have been adopted, because the Factory Department would insist upon it.

12,483. Is there any reason why the Mines Department of the Home Office should not do the same as the Factory Department has done for the factories and see the necessary safe precautions are adopted?—I have no reason to doubt the Home Office has done and would do all it could in that direction. I am not bringing a charge against the Home Office of failure of duty. My point is, all you can secure by penal enactments is a bare minimum; that the inherent difficulties of a criminal law compels you to restrict your requirements to a minimum which you can enforce universally and with common consent, and there is very much more that could be done voluntarily by the persons in charge of the industry, and very much more is done, I hope and believe, by particular collieries above the minimum that they are required to do; but against that, under private enterprise, you always have this permanent pull of the profit-making motive which must affect even the most benevolent and philanthropic colliery owner; therefore I suggest under a public department you would have those, what I will call potential, precautions taken to a larger extent.

12,484. Have you any knowledge of the way the dockyards carry on their work?—No, I cannot say I have any personal knowledge.

12,485. Do you know whether in the dockyards the precautions for the prevention of accidents is greater or less than in the ordinary shipyards of the same category?—I do not know the proportion of accidents. I think it is a defect that we have not a more scientific costing system on that head. The Admiralty always

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

claim they do take very much more precautions against accidents than in the private shipyards. They are constantly bringing forward that as an argument when an increase of wages is asked for. It is pointed out that the workers in the Admiralty dockyards get advantages which the workers in ordinary shipyards do not get.

12,486. Do not confuse things. Do you suggest these advantages relate to safety precautions?—Yes, some of them. That is one small point.

12,487. Are you advised on that point?—I am giving my opinion.

12,488. It is very dangerous, because, as a matter of fact, these advantages do not relate to safety precautions, but the general conditions under which the dockyard is run from a labour point of view?—I suggest that safety from accidents is definitely one of those things.

12,489. That is your opinion?—Yes.

12,490. Have you had any experience of safety precautions being provided and not used?—No, I cannot say I have anything in the nature of personal experience. I know the fact is so.

12,491. Have you any knowledge that safety precautions are provided and are actually removed before the work proceeds?—I have no knowledge of that, but I can quite believe it.

12,492. Have you any knowledge of the fact that miners have been prosecuted for exposing naked lights in mines?—I am aware of that.

12,493. It comes to this, the employer is not altogether responsible for the precautions in respect of having provided precautions that they were not taken advantage of in all cases?—I do not think the moral duty of the employer is limited to merely placing the precautions there for the men to use. As a matter of fact, I apprehend even the Coal Mines Regulation Act requires him to carry on an elaborate system of supervision and inspection in order to see the precautions are taken advantage of, and it is part of my suggestion that that supervision and inspection is not attained—is not sufficiently comprehensive.

12,494. Surely, do you suggest that in a mine, or in a shop, or in a factory there ought to be some one continually on the spot watching an individual to see he takes advantage of the precautions that are provided for his safety?—I do suggest that, and, as a matter of fact, that is the case.

12,495. Where?—I do not say one supervisor is to stand over each one man, sailor, or miner. As a matter of fact it is part of the duty of the captain of the ship to see necessary precautions are taken by the seamen under his command. The captain of a ship usually makes a minute inspection of the ship every day to see these precautions are taken. I do not suggest that every mining shareholder should make a minute inspection of the mine.

12,496. That is perhaps going to extremes. It is not what happens while the superintendent is watching the men; it is what happens when the superintendent is not watching the men that causes the trouble?—I think it is both. I admit you cannot have supervisors standing over each man all the time. The amount of supervision and inspection will vary from next to nothing to a great deal.

12,497. Supposing there are safety precautions fixed to a machine, and these are unbolted and removed, would you hold the employer responsible for that or would you say he was guilty because his tendency to cut down the expense of management has prevented him taking a humanitarian point of view?—It might be he was guilty if, for instance, the machinery had not been inspected for six weeks. You put the case of a bolt been removed just after the inspection and put back before the next inspection: no court would convict that owner of culpable neglect. You can easily understand it might be culpable neglect.

12,498. Do you think seriously the supervision which is required to look after the safety precautions would be greater in the case of the supervisor or inspector employed by the Government than one employed by private enterprise?—Yes, I do.

12,499. Do you think the private enterprise is wholly disregarding the interruption that takes place in works will cost far more than the accident itself?—I do not think the private owners of collieries at all wish to disregard the pecuniary loss that is incurred by accidents, but on the whole it does seem to me that the motive of saving cost does come in to militate against the fullest possible use of precautions.

12,500. I take it, therefore, that of the coal owners as a whole you have rather a poor opinion in that respect?—No, I think, poor creatures—

12,501. I do not think they ask for your sympathy?—That will not prevent my extending it to them I think, poor creatures, they are acting under the influence of a bad system; they are dragged by their profit-making motive even unconsciously to themselves.

12,502. They are not singular in that respect?—No. There are a great many other people in other industries who are subject to the same thing.

12,503. With regard to the nationalisation you propose how would you deal with by-products at a coal mine?—I would deal with them in exactly the same way as the main products.

12,504. So that if there were coke ovens or residual products?—With regard to coke ovens and residual products it seems to me they would be dealt with by the allocation department by sending them where wanted to the best advantage.

12,505-6. Would you nationalise the coke ovens and residual products in the same way as the coal?—I would certainly take over for the State the whole of the assets of any particular colliery. I do not suggest you need necessarily at the same time nationalise a coke oven which is not being carried on in connection with the coal mine, if there are any such.

12,507. In these residual products or in the manufacture of coke you would have two jurisdictions in the industry; first, the nationalised jurisdiction where the mines have been nationalised, and private ownership where they are not?—I would have two in place of several hundreds. You have now your private enterprise coke ovens and many coke ovens run by collieries. We should reduce the jurisdiction by substituting the one State ownership in connection with the coal mines in place of the multiplicity at present.

12,508. So far as the mine owners who run coke ovens in connection with their collieries?—Yes; in that way there would be a diminution of competition.

12,509. I suggest again that is a matter of opinion?—Certainly; we should be substituting one owner for a number of owners.

12,510. With regard to your purchase price of the collieries you indicate what would be required to buy out the shareholders?—Yes.

12,511. What provision do you make for working capital?—I have not suggested anything thereon, as a matter of fact, in the pamphlet that has been referred to. I have put down a considerable sum to cover not only working capital, but also cost of improvement.

12,512. That would have to be found separately from the purchase price?—Certainly, except in so far as the ordinary working capital of the colliery would be taken over, of course, in purchasing the concern as a whole.

12,513-14. Does not that belong to the shareholders?—If I buy in the aggregate the shares of the company, I buy the assets of the company. I say if I buy the shares of the company, I purchase in that act over its cash balance; therefore I should take over the existing working capital in the compensation. It is merely the additional working capital which I foresee the State ought to put in to make improvements which I have otherwise provided for.

12,515. With regard to the question of the profits made by the collieries, have you any information as to what those profits have been over a period of years?—Yes, we have of course had before this Commission a great deal of evidence.

12,516. I may be wrong. As a matter of fact, I have not been able to read what took place previous to my advent. You may tell me what took place. Over

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

what period have you information as to profits?—I have forgotten; certainly not any long period. I think we had information with regard to about a decade; I think information with regard to the Scotch collieries longer than a decade.

12,517. What average dividend was paid then?—I think we can take the average net profits of the coal mines were 9 per cent.

Sir Arthur Duckham: That was for five years.

Sir Allan Smith: These five years are extraordinary five years.

Sir Arthur Duckham: Before the war.

12,518. *Sir Allan Smith*: Would you be surprised to find that for years on end the colliery industry made no profit at all?—I should be surprised to hear that for years on end.

12,519. Would you be surprised to know that the average profit for 50 or 60 years does not exceed 5 per cent.?—That is contrary to the evidence given. I remember going to a colliery some years ago for another purpose. The owner of the private colliery was sufficiently candid to unlock his private ledger and show me his profit and loss account for the preceding ten years. No other business man has done that to me. It was interesting to notice two years' net loss; four years' net profit, then two years' net loss, and so on. I am quite aware there are such things as years of loss.

12,520. With regard to the co-operative coal mines I understood you to say that the co-operative movement has certain coal mines; is that correct?—It has begun. The English Co-operative Wholesale Society has purchased one colliery.

12,521. How long have they had that?—I think about a year.

12,522. Can you tell me whether the percentage of accidents there is greater or less than the average?—I cannot. I should doubt if there was any difference, or whether there has been time enough to get any return.

12,523. Notwithstanding the absence of the sordid motive?—Yes, I have no information.

12,524. With regard to research, do you know what is done in other industries with regard to research?—Yes, I have sat on Committee in connection with the Council of Science and Industry.

12,525. Do you know in some industries a great deal is being done in research?—In some industries work is being done; "a great deal" must be a matter of opinion. I do not regard it as a great deal.

12,526. Take the metal trade. Is there not a great deal of research being done there?—Certainly there is a great deal of research compared with nothing; but, compared with what there might be, I cannot help thinking it is inadequate; it is hardly worthy the name of a great deal.

12,527. Where does the money come from which provides funds for carrying on that research?—I suppose it is contributed—it is very often done at the expense of the professors themselves.

12,528. I did not know they were a profit-making people?—No, I am not aware that professors or the university continue researches for profit; but they have nevertheless conducted a great deal of research.

12,529. You know private enterprise and private subscriptions have set up laboratories?—I am aware they have set up some. I believe the Gilchrist-Thomas process was discovered in a back room in London by a student of the Birkbeck Institute.

12,530. Quite possible, and other discoveries have come by accident?—By accident to the man looking out, but not generally by accident in an ordinary sense.

12,531. By an accidental circumstance, but in a general investigation?—You mean there was a brain at work?

12,532. Is it not the case so far that the State has done less in the way of pioneer research than private enterprise?—That is not true generally of the State. It is a special defect of our Government that it has done so little. But the British Government has done a great deal more than is usually remembered, especially in coal mining. The British

Government has done a great deal at the expense of the taxpayer for a long series of generations. I may observe that the National Physical Laboratory is of some importance.

12,533. I do not suppose you contend that nationalisation would altogether eliminate the risk of accidents?—No, I have said so. I have said you cannot hope to avoid all accidents. I would put it more paradoxically and say if it really is an accident it cannot be avoided. What we call accidents are things which ought not to occur, or a good many of them.

12,534. I suppose you have heard of a place called Chepstow?—Yes.

12,535. Do you know there is the beginning of a shipyard there?—Yes.

12,536. Do you think that is a satisfactory adventure of any Government Department?—I have heard a great deal of criticism of it. I am not prepared to pronounce judgment whether it was a wise step or not.

12,537. You also know of the activities of another Government Department at Crippenham or at Slough?—I am quite confused as to which Government Department that is.

12,538. There are so many I cannot tell you at the moment?—With regard to that Crippenham experience, if it is to be mentioned, may I say we have not heard the last of it yet?

12,539. Not by any means?—I do not know what the result is. It may prove to be a brilliant success for all I know.

12,540. It may?—I am not at all admitting it is a failure.

12,541. With regard to infantile mortality, you refer to the difficulty of drying wet clothes and domestic troubles due to the calling of the miners?—That was a suggestion of mine as the only distinguishing feature which I could discover.

12,542. Surely nationalisation is not required in order to get over that?—That is quite true. I did not suggest it was.

12,543. I assume that point would be perfectly well met by making provisions, either by way of pithead baths or by communal baths in the miners' villages or elsewhere, to get over the difficulty?—I have to point out the mining industry has existed in private hands for a great many years, and when the Government actually was convinced that pithead baths were necessary, and endeavoured to make them universal by the Coal Mines Regulation Bill in 1911, that was opposed by the colliery interests and it had to be dropped. If we do not have pithead baths at this moment, I think it is to be directly ascribed to the influence of the colliery proprietors. I do not believe the colliery proprietors had any animus against pithead baths or any desire to prevent the workers having the advantage of them, or any desire that babies should die; but the pull of the profit-making motive necessarily and almost inevitably led them to object to this charge being imposed upon their industry.

12,544. I suppose even a member of the Fabian Society may change his mind by experience?—I hope the members of the Fabian Society are noted for changing their minds whenever any evidence is produced.

12,545. The information for the Commission has not been that the owners have not provided them?—There has been no evidence that the mine owners are willing to erect pithead baths.

12,546. I suppose you are aware of the provision of the Factory Act with regard to the provision of basins, hot water and soap in certain industries?—That has been brought in by the Home Office during the last two or three years.

12,547. No, long before that?—It was under the Factory Act of 1915.

12,548. You are rather misinformed on that point.

12,549. *Sir J. Chiozza Money*: It is perfectly right.—There were certain exceptionally dangerous industries like lead in which it has prevailed for a few more years.

12,550. *Sir Allan Smith*: Or brass, where provision was made for washing?—Exceptional industries. I am talking of the general requirements.

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

12,551. I am referring to the particular requirements which were made and have been in operation for some years?—You did not mention the particular industries at first.

12,552. That was my intention. Do you know whether these have been taken advantage of by those for whose benefit they have been installed?—I am aware they have very largely been taken advantage of.

12,553. Then, again, I am afraid we must put that down as a matter of controversy?—I am giving the evidence.

12,554. I accept your information. You have figures, and it may be your experience is not as complete as is required for a definite pronouncement of your opinion?—I have yet to learn I give an opinion without warrant.

12,555. Have you visualised any scheme of unification which falling short of nationalisation would give general satisfaction?—No, I have considered such schemes of unification as have been suggested as far as I know and such as I have been able to think of. I have not found any scheme of unification of the coal mines which holds out any hope of getting rid of this permanent pull of the profit making desire that I have spoken of in an adverse way, to housing, accidents and infantile mortality; but, further, I have not seen any signs of unification which would not put the consumer at the mercy of the proprietors, and I have not been able to discover any possible safeguards or controls by the Government which would adequately protect the consumers, as I have explained. Then there is a final consideration. There may be something to be said for private enterprise and private ownership, initiative, freedom, and so on. There may be something to be said for the advantages of public ownership; but there is a great deal to be said against a system of private ownership which is then put under bureaucratic control. You are apt then to lose the advantages of a better system; you lose the production and the initiative of the capitalist because he has always to be checked by these public regulations; and, on the other hand, you lose the advantage of public ownership because you do not get the additional benefits; you can only enforce a minimum, and you have the perpetual conflict of two forces, which is not economical. To give an illustration, there was a time when the London Water Supply was in the hands of eight companies. They carried on a great deal of unification that got rid of internal competition. I was then on the London County Council. We were always fighting the water companies to get further and further control for the benefit of the consumer. A very eminent Counsel whom I know who was standing Counsel for the Water Companies, at a certain point went to them and said: "Gentlemen, the game is up; whatever the advantage of private enterprise so long as uncontrolled, we are losing this advantage because it is put under control and restriction; you had better take the opportunity of selling out and let it pass into municipal ownership." That is illustrative.

12,556. Illustrative of the wisdom of Counsel in advising his clients?—Yes.

12,557. But not illustrative of the advantage of making such an extraordinary experiment of such vital importance as nationalisation of the coal industry?—I think it is.

12,558. The circumstances are different. There you had the unification first to find out that position; here you have no unification?—I said you had partial unification. There were eight separate companies. There is now only one London Water Board. The unification has gone on to a certain extent only.

12,559. With regard to the benefit to the State, do you hold the view that whether the balance sheets of a nationalised enterprise show a profit or not that nationalisation would give the individual citizen an immediate profit which cannot be shown as a balance sheet profit?—I think that is so, certainly.

12,560. Do you suggest that whether a balance sheet shows a profit or not is no criterion as to whether or not the industry as so carried on under a nationalisation basis is good or bad for the nation as a whole?—It is putting it strongly to say no

criterion. I say it is only one factor. In any estimate of advantage I would not give it all to that factor. There is no contemplation of a national coal industry that could not make out a level balance sheet. Presumably the price would be fixed at such a figure as to cover the cost.

12,561. That is finance of a description that would not be tolerated in the sordid motive of profit-making. In other words, you would make the punishment fit the crime?—I should ask the consumers of coal to pay the cost of producing the coal.

12,562. Whether that is uneconomical or not?—It is the best method of production the community is capable of.

12,563. Not necessarily the best?—An angel might conduct it better. You cannot do it better than the communities' knowledge will allow.

12,564. We have not to deal with angels, but people who have tried to make good in the industry of coal winning?—I wish to take advantage of every possible knowledge and experience those people can bring.

12,565. With regard to the labour conditions under a nationalised scheme, do you think the conditions under a nationalised scheme would be better than under a private scheme?—I think it is probable they would.

12,566. Why?—I have once or twice expressed, I think, that a large proportion of the number of stoppages are due to resentment at particular acts of what are considered tyranny. I think a better organisation of the industry would eliminate the opportunity for those. I do not mean to say it is because it is State employment; I mean the industry would be better organised.

12,567. Do you think Woolwich Arsenal has been freer of labour disputes than the ordinary engineering shop?—As a matter of history, it has been very much freer.

12,568. Are you satisfied of that?—Yes, I am. I am speaking with some knowledge of the labour side of the engineering industry.

12,569. I am not altogether without knowledge on the same point?—I am aware of that. I suggest if you take the last 50 years since 1870, there have been fewer stoppages at Woolwich than in the privately directed engineering industry.

12,570. Take the last five years?—The last five years has been a very exceptional time. There have been a great many stoppages in the engineering industry where privately owned.

12,571. Including Woolwich?—Excluding Woolwich. I said a large number in private industry. That would exclude Woolwich. I do not think there have been more stoppages in Woolwich than in the private industry during the last five years.

12,572. Do you think that a Government official is a more human individual than an official acting under this sordid private enterprise?—I think it would be very much the same individual, but he would have a different set of motives.

12,573. Let us examine that. The manager in Woolwich has got his salary and has to do certain things. He knows nothing about profits; the manager in an engineering factory has his salary to do certain things and has nothing to do with profits; what difference, psychologically, operates in one from the other?—I suggest, if you put it to me, that the manager of the State enterprise would be even unduly desirous of avoiding trouble. I think there might be something in that. I think the errors of the managers of the State enterprise will be that they will be continually thinking that they must not have friction.

12,574. Then, if they do, they are failing in their duty to their superior, the State?—Quite so. I think there might be a tendency to err on that side.

12,575. The cost of production will be piled up against the nation?—That would require to be corrected by appropriate organisation; the error will be not that he will have more trouble but less trouble.

12,576. Have you had any practical experience in handling labour in a factory?—I am happy to say I have remained unspotted in that respect.

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

12,577. Your provisions are quite untrammelled with the main activities of life in that sense?—I have my experience of administration without them.

12,578. Is your theory more theory than practical?—I have had a practical experience in administration.

12,579. Does experience in that direction tend to be of value when you are dealing with human nature of labour in a factory?—I think it does. I have even written a book on works managers.

12,580. My enemy has done that?—He is buying many copies of this book.

12,581. Out of curiosity perhaps?—And is learning from it too.

12,582. With regard to the advantages first taken in relation between municipal employers and private employers, would you suggest that a greater advance has taken place in the Government establishment than in the privately owned establishments?—Really I cannot say. I am not concerned with that action one way or the other. I am afraid I cannot answer that. I have not it in mind which side has had the greater advance.

12,583. You are aware of the general administration of Government departments?—Yes.

12,584. Are you aware that until recently the dockyards and arsenals had to approach the Government by way of a formal petition to be heard?—Yes.

12,585. That petition is heard twice a year?—Yes.

12,586. Is anything like that taking place in private establishments?—No.

12,587. Would you say that is an out of date arrangement and ought to be abolished?—Yes.

12,588. Therefore in that respect alone the private establishments have been ahead of the Government establishments?—The private establishments also, or a number of them, absolutely refused to receive the men's case when presented by their own officers.

12,589. What sort of establishments are you referring to?—The very large number of establishments that would not recognise the trade unions.

12,590. In what trades?—In all trades.

12,591. Take the dockyards the same as the shipyards. How long is it since the shipyards refused to recognise trade unions?—I really have not that in mind.

12,592. Take Woolwich Arsenal, compare that with the engineering establishments. How long is it since the engineering establishments refused to recognise trade unions?—I have not that in mind. There are still establishments that refuse to recognise trade unions or admit any trade union official. There are still industries in which trade unionism is forbidden by the employers and stamped out when they get a chance. You must put one thing against the other.

12,593. These industries in the main are rather small?—Some are large.

12,594. Mention some?—The flour milling industry.

12,595. Supposing you had the interchange of cost indicated in your précis and supposing you have your consumers' interests watched over by some form of co-operation, not bureaucratic control, or some form short of bureaucratic control, and supposing you could lose your obsession with regard to the sordid motives of profit-making would you consider it feasible to build up a scheme that would be satisfactory from the standard standpoint short of nationalisation?—No, because I cannot imagine any system of control of cost and prices which would be adequate to prevent the ingenuity of private interests from getting round them. The ingenuity of the private industry in dealing with public regulations is very great.

12,596. Has that not been got over by the Defence of the Realm Act and the Munitions of War Act?—No, I think the Defence of the Realm Act and the Munitions of War Act have always left an enormous margin for what I can only characterise, using my own term, as plunder, advantage being taken of the State to make an excessive profit.

12,597. Has the State made a profit?—Every advantage is being taken of the necessity of the State by private capitalists to make, privately, excessive profits.

12,598. Are you not aware in many cases the State has compelled the employers to show their costs and the costs have been fixed, not from the employers' point of view, but from a strict actuarial point of view?—Yes, and to great advantage in many cases. The effect has been to throw light on the enormous plunder that has been made.

12,599. It has stopped it?—It did in particular instances to some extent stop it.

12,600. If it was successful thou would it not be successful now?—It is not successful. I must prevent misunderstanding. I mean the influence of the Defence of the Realm Act and the regulations of the Munitions Department have not been successful in privouing excessive profits at the expense of the community, and I must not be quoted as saying that they furnish an instance of where the Government is successful in preventing excessive charges; they have not been successful. They have only been successful in that case to a partial extent. The amount of the Excess Profits Duties shows how enormous the profits have been.

12,601. The Excess Profits Duty is not confined to manufacturers?—No. Excess Profits Duty is not confined to manufacturers, but there is very little except manufacturers and extraction and shipping.

12,602. I am taking it generally from your evidence that although you say you have an open mind you have not with your great experience of this matter been able to introduce anything yourself as a substitute for nationalisation?—Assuming we must have unification, assuming that unification is necessary, I have not discovered any way in which the nation could safely allow the coal mines to be owned by a great trust without danger of an excessive price to the consumers, without danger of an interruption of the supply and without any particular disadvantage as regard housing, accident and infantile mortality.

12,603. Do you proceed on that assumption having regard to the terms of paragraph 9 of the Chairman's Report?—Yes, as at present advised. We have not yet had any evidence from the mine owners. I shall consider any evidence that is presented on behalf of the mine owners.

12,604. Do you think the opening words of that paragraph "so far as the evidence already given is concerned"—?—Not "so far" pardon me. "Even on the evidence already given" which has a very different meaning from "so far."

12,605. Even on the evidence already given supposing evidence were given by the coal owners or others which would rebut the evidence given you would hold yourself free to alter your conception if you thought that was necessary in view of the further evidence?—Certainly.

12,606. *Sir L. Chiozza Money*: Sir Allan Smith said something to you about the beginning of a shipyard at Chepstow. Look at that. Is that a picture of a shipyard pretty well completed at Chepstow? (*Handing photograph to the witness.*)—Yes; there is more than a beginning perhaps; there is laying the first keel.

12,607. It is to show Sir Allan Smith was asking you about something he had not examined. Who initiated the Chepstow Yard?—I do not know.

12,608. Do you know it was a first-class business man, Sir Eric Geddes?—I am not surprised.

12,609. Will you take it from me it was Sir Eric Geddes?—Yes.

12,610. If it was Sir Eric Geddes, Sir Allan's question is a reflection on a first-class business man?—We have to consider the particular necessity the Government may have been under at that date.

12,611. Are you aware it has been carried on by other first-class business men, including Lord Pirrie and Sir William Collard, both business men?—Yes.

12,612. If the Chepstow Shipyard is a hideous mistake, they are hideous mistakes of business men?—I did not say they were a mistake.

12,613. But if they are mistakes, they are mistakes, and hideous mistakes of business men?—That inference would be drawn.

12,614. With regard to the trade cycle. It is suggested to you that there would be great difficulty in dealing with the nationalised coal industry because

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

of the variation in the output of coal. Look at that record of the output of coal in this country for 50 year and look at it from the year 1870 down to the present time. Perhaps you might take it for 43 years down to the beginning of the war. Is it not a steady increase? (*Handing document to the witness.*)—The whole fact, of course, is a steady increase. I believe that the particular years, five or six years during which there was a setback in the absolute aggregate production, the setback was never more than 5 per cent., and was usually only 1 per cent. or 2 per cent. Practically there is no variation in the production of coal deviating from a steady rise, except to a very trivial extent even in the worst years.

12,615. In other words, the question was asked you again under a misapprehension of the facts?

Sir Allan Smith: I have no desire to raise any question as to what my apprehension was or not; that is for the witness and not for the cross-examiner.

Witness: It did not refer to you, I think. As a matter of fact, we are always too much under the impression that the cycles are very bad in their magnitude. I indicated in my first answer the year of depression was much more serious with regard to the depression of profit, and, to some extent, depression in price than any depression of quantity.

12,616. *Sir L. Chiozza Money:* There is a difficulty to be apprehended with regard to any particular setback in output because of the trade cycles?—So far as the last 50 years' experience is concerned, it shows there never would be any diminution in the production of coal.

12,617. Now with regard to the efficiency of Government operations. Have you any information as to the work of the National Physical Laboratory during the war?—Yes.

12,618. Are you aware that it afforded the very greatest assistance to the private manufacturer, who had hitherto done nothing in that direction with regard to the manufacture of fine gauges?—That is so, and in the enormous work of the National Physical Laboratory before the war it was of great value to various industries.

12,619. It was the neglect of standardisation of business within this country that led to that neglect?—To a large extent the Government Engineering Standardisation Committee has been the means of improving standardisation.

12,620. Is it not true the efforts of the State Department, the Ministry of Munitions, has done more to-day with regard to standardisation in this country than during the previous 30 years?—That is likely.

12,621. With regard to theory and practice. Some questions were addressed to you that seemed to question your right to speak of this subject as a practical man. Is it not a fact that during your experience at the London County Council you were directly concerned with the administration of a great many very important public works?—Yes, I was. I may say this, that whilst I was there I was nearly always Chairman of one of the important committees, and practically I was responsible for the administration of large sections of what was perhaps the largest, or what was then the largest, staff and most varied staff in any enterprise whatever in the Kingdom.

12,622. So far as any judgment or experience was concerned, was not that as good experience, or a better experience, than is gained by most business men who carry on these collieries?—It does not fetch so much money. I have been very pleased to take advantage of it.

12,623. Did you do that under the incentive of private profit?—The members of the London County Council are not paid.

12,624. With regard to private profit, when you were criticising profit it is the case, is it not, that you were criticising commercial profit?—Yes, I mean the ordinary profit on price; the profit which is the margin between what the man has to pay out and the price he gets for the product he makes.

12,625. You were not criticising the propriety or advisability of making profit in its real sense for the nation?—The surplus which is either in the balance sheet of the co-operative society or Govern-

ment Department, or of the whole community, is not profit in the same commercial sense.

12,626. Are you aware what usually happens in a democratic country when profit is made in a State Department; there is then a call for reduction in price?—Yes.

12,627. Is not that what happened in Australia?—Yes, and in all municipalities.

12,628. Is not the effect to give the commodity at the lowest possible price to the consumer?—That is the tendency, and that is far better than making a surplus that is called profit.

12,629. Would not that be a far better thing for the industry of the country if applied to coal than if coal owners were able to make huge profits, which is recommended to you as a good thing to be aimed at?—Yes. I consider the profit of the capitalists, except so far as necessary to attract the capital and brains in the industry—anything beyond that is not any advantage to the community. The height of the capitalist's profit is a waste to the country.

12,630. May I ask you with regard to high profits: Is it not the fact that the spending of those high profits by the people who make them takes the work out of the productive industry and puts the profit into an unproductive industry?—It gives rise to a multiplicity of servants.

12,631. With regard to the question of the indictment of private enterprise I take it you were not indicting individuals?—No. I was trying to be very careful to sympathise with the individuals who found themselves caught in a bad system. It is the system I was indicting.

12,632. With regard to the indictment which is the indictment of the system and not the individual, is not the Mines Act itself in the majority of its clauses an indictment of the system of private profiteering?—I had not thought of that. It would be so expressed very well. The results of the profit-making industry were found to be so bad that the Criminal Law had to step in to prohibit certain things which were being carried on. That does amount to rather an indictment of the system.

12,633. *Mr. R. H. Tawney:* You are anxious to see the system of public costing adopted in coal mining?—Yes.

12,634. Would you explain more fully the kind of advantage you expect to get?—By costing I mean a scientific, accurate and precisely ascertainable cost of each particular operation from the beginning to the end in each particular enterprise and then the continuous comparison of those costs in order to reveal anything which is startling above or below the mean, and so direct attention to those exceptions.

12,635. That is to say, as the criterion of efficiency of management you would rely on your costing system instead of on profits?—Very largely. The costing system would be a real test of efficiency. The making of profit is only a test of making profit and has no necessary connection with efficiency. The amount of the profit is very far from being the measure of the efficiency.

12,636. About the position of the worker in a nationalised industry. How far do you think that the transference of this industry from being a service carried on for private profit to being a service carried on for public benefit is likely to produce any psychological change in the attitude of the workers towards it?—That must, of course, be a matter of estimate. I think there will certainly be a change. I am prepared to apprehend and to look out for a certain tendency to what has been called the Government Stroke. It is quite possible that in some cases some of the men may think they will take advantage of not being looked after by a profit-making employer. I think that can be counteracted. On the other hand, I think there will be amongst a number of the men, and I hope progressively amongst all the men, a good, healthy sense of being engaged in public enterprise for public good. I think that is a great advantage. I think the elementary teacher gains enormously by his feeling that his service is for the public good. I think the miner is capable of the same sort of stimulus and emulation.

12,637. Do not you think one of the conditions of developing that kind of spirit is that the workers should have effective control over the conditions of

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

their work and be responsible for its success?—Speak generally, that is so.

12,638. How far does your scheme allow for the creation of an organisation that would develop that?

It is very difficult to sketch out organisations. I can only make a plan for consideration. I suggest what you are thinking of does not depend quite so much on committees and councils, as sometimes has been suggested. I think the desirable thing is that every individual person in an enterprise should have a definite duty and a definite responsibility. I think any man who is charged with a responsibility is elevated by it. I should like to see every man with a precise definite duty and responsibility and proper power in his own degree. I look more to that division of power instead of concentration of authority for the moral effect.

12,639. With regard to your pit committees which should have authority; would you allow them to elect managers or sub-managers or should they be merely advisers?—I suggest they would be better for criticism. I should hope there would be no question of deciding things by majority in future. It ought to be a question of taking counsel. I look in future to not so much peremptory authority in the world. I think that is a product of very feeble intelligence. Anybody can govern in a state of siege. I think the report of the costing expert would be shown to the men and the manager will say, "What are we to do with this? We are shown to be in excess of some other men," and they will take counsel together as to what they are to answer to that.

12,640. I do not know if you can say anything about the export trade. Have you any special proposition with regard to that?—I suggest with regard to the export trade it is quite a separate question from the rest of the argument, and there are three alternatives: either the State Mines Department could carry on the export trade as the exporters now do with the advantages that Sir Richard Redmayne pointed out, that they would be a united body dealing with foreign purchasers. That is one plan. The second plan would be that the State should carry on the enterprise but should employ the existing export merchants and factors to do the business for it at a commission. I believe that there are such transactions already and some of these experts do act for a commission. The third plan would be the State will say we will not trouble about the export trade, but leave that to these export merchants and factors and merely sell them the coal for them to make a profit on it if they can. I think there are those three alternatives. The question will be affected by what is done with regard to foreign Governments. I expect in future the Governments will to an increasing extent purchase collectively what is required for the inhabitants of their countries and possibly over long terms. If you come to have Governments contracting, as we have already had during the war, for large enterprises, such as all the wheat, all the wool and all the coal, possibly it would be better for the Minister of Mines to do the business.

12,641. That is to say, the problem of the export trade can be treated if necessary as a separate problem?—Yes; it is quite easy.

12,642. It is not germane to the larger question of nationalisation?—It is not germane. It is not a difficult problem; it is quite an easy job.

12,643. You say the Minister of Mines should have a seat in Parliament. Are you aware of the kind of objections that are made to that proposal?—They are founded on lack of knowledge and misunderstanding of terms. In the sense that the Minister of Mines will be responsible to public opinion I want him to be in politics. I want him to be responsible to public opinion. If it is supposed he will necessarily have a different policy of administration because he belongs to a particular cabinet Government, let me say I do not think that is true any more than the Post Office has a different policy.

12,644. Do you contemplate your mining service under these proposals being financially self-contained?—Yes, certainly, except so far as it may yield a surplus of revenue to the Exchequer.

12,645. A criticism sometimes advanced against that is that by some concealed method it might be subsidised from the public funds?—I do not think it would

be possible to conceal that method. In any case, I would suggest the people who will not be in the employment of the Minister of Mines are so far much more numerous than those that will be in his employment, in fact, ten times as numerous. There will be no likelihood of a bias in favour of the miners. He will be held well in check, so far as he is in Parliament, by the opinion of the consumers of coal. Secondly, I would point out, in so far as electoral pressure is concerned, it has been so contrived by Providence that the miners are all together in about 30 constituencies in which they exercise great influence, but they exercise very little influence in the other 670; such little influence as they may have will result in their returning members to Parliament as they ought to do, but will not exercise the sort of influence that is exercised by the teacher or Post Office official. I do not say it is bad over all the constituencies, consequently it is a much simpler question with regard to that particular political difficulty than the taking over of all the Schools, for instance, which we have done, or the running of the National Post Office, which we have managed to do.

12,646. You seem to think the consumer will keep his end up?—I think consumers will have an influence on public opinion and the House of Commons more than the miner himself.

12,647. Do you desire to see the consumer represented *qua* consumer on the Mining Authority, or do you think the officials of the State are sufficient to speak for them?—I think there might be an advantage in having some representative of the consumer on the National Council, not because of any vote he might exercise, but he might be there as a voice.

12,648. *Mr. Frank Hodges*: You are aware that in 1912, when the Miners' Federation brought in a Bill for the Nationalisation of Mines and Minerals, they dealt with the question of compensation in that Bill?—Yes.

12,649. In that Bill in clause 3 these words were put in: "Provided always that the value of any minerals or right to work minerals or mineral wayleave shall not be taken into account in computing such price, for all of which sufficient compensation shall be paid"—Yes.

12,650. That is so; they did not propose to compensate mineral owners for their holding at that time?—That is so.

12,651. In your précis and in your evidence you rather object to that point of view?—I always think in proposing to expropriate any particular private owner it is well to give him compensation, not for anything he has, but for your disturbance of his established expectations. I am quite aware that when workmen have been disturbed in their established expectations through the shutting down of mines, or anything of that sort, they have not been compensated. I think that is wrong. I do not think it desirable to repeat that wrong in connection with the owners. I was successful when on the County Council to get compensation for watermen who were disturbed because a bridge was made. I think it is the right thing to give compensation to any person whose income is interfered with. I cannot help thinking the royalty owners ought to be dealt with in the same way. The leading case is the Tower of Siloam. The people on whom the Tower of Siloam fell were not greater sinners than others; but for the grace of God we might all have been royalty owners.

12,652. There are not many miners who are royalty owners?—I should think possibly not.

12,653. It is proposed to compensate royalty owners in hard cash or in money of some kind?—Yes.

12,654. That would be on the assumption that they are to be losers of money?—They are going to be losers of what they have regarded as their own incomes.

12,655. Is not there an objection to royalty owners being similarly treated—I put the point quite seriously—to individuals who have put some money into something?—Yes, that, of course, is arguable, but I would suggest as a matter of practical experience it is extremely difficult in any old standing income to distinguish between the people who have given value for it and those who have not.

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

A large proportion of these 8,000 recipients of royalty rents probably have purchased those royalty rents, or their ancestors have, and the number who have those royalty rents by grant from the Crown in some past epochs which they, perhaps, ought not to have had, is not so many as we think, and it is difficult to distinguish between them and the others. The better opinion is after a long period of years you had better assume all titles are equally good or bad, but treat them all alike.

12,656. I gather from your own calculation that would involve the nation in the cost of something like 60 millions?—Yes; that is to say, we should redeem an income of six millions a year for sixty million pounds. We need not bind ourselves to the exact figure. I think that is about it.

12,657. You propose that should be, as it were, a tax upon the industry?—Yes, that is to say, the industry would gain by the 60 million between the cost of borrowing 60 million and the six million a year. There would be really two million odd more to the industry per annum.

12,658. That rather limits the possibility, does it not, of the industry itself hearing that burden as it, in fact, now bears the burden?—Quite so. You would only gain the difference. The difference would be something like two millions to two and a half millions per annum. It would be a nice little sum for the housing.

12,659. What do you think, apart from the question of finance and apart from the question of better administration which you emphasised considerably yesterday and to-day, is the cause of this question of nationalisation coming to the front at this particular moment?—I think, in the main, it is an awakening of consciousness among the wage-earners; that they are, if I may put it this way—they are rising to manhood and not willing to go on as a class for ever obeying orders which are given by another class of property owners; and they are asserting they want to be their own masters in the only way in which in a dense community anybody can by his own efforts do so.

12,660. That would be, in your judgment, much more potent, perhaps, than a mere academic looking at the problem of production?—I think so, when you regard a mass movement. It is much more a movement of feeling that is necessary than any working out of a theory; that must always be so when you are dealing with a mass of men.

12,661. Would you say the industrial strife of the last four or five years in the mining industry, (apart from the question here and with regard to wages), that that volume of disputes that has arisen is indicative of some such spirit as you have described?—That is my own opinion.

12,662. Do you think that has been made more manifest during the war?—I think it has. I think the war eventually has made the nation realise that it is a nation. We have been working for these four years, and we have been putting forward a great national effort which everybody has felt to be a national effort. The Post Office was a dull, drab thing. You could not get up patriotic co-operation in the Post Office. The war has brought this home to everybody—that there is such a thing as nationalisation, and it is for the nation collectively to do something and to do it with no small measure of success. I attribute to the indirect effect of the war the rapid quickening of the spirit.

12,663. That is what the effect of clogging production means. It was more or less spasmodic during that period?—The friction and stoppages to which the feeling gave rise, I think, have been a great drawback, of course.

12,664. If that is symptomatic of that feeling, what would be the trend of events if the miners had to face the possibility of a great national capitalistic trust? Would that make for happier relations between the workmen and the employer or for more continuous production?—No; of course, I think it would be a most gigantic calamity. I am convinced that the formation of any capitalistic trust must inevitably cause this feeling to flame up into very serious dimensions.

12,665. What do capitalistic combinations result in? Do they result in still greater trade union combinations, do you think?—Trade unionism cannot go very much further among the miners than it has gone, but I think the spirit of trade unionism would be enormously strengthened amongst the miners; I think also the miners would find allies in their resentment amongst the other trades.

12,666. If that antagonism grows, that is to say, if trustification was to be substituted for the present system, and not nationalisation, you would have the growth of an antagonism which sooner or later would result in a vast national calamity?—That would be my very serious apprehension.

12,667. You would say that that is a fact or supposition which the employer class ought to direct very great attention to?—I think it is a fact that must be taken into account by everybody, and especially by the statesmen.

12,668. *Mr. Robert Smilie*: When referring to compensation I take it you meant compensation for the known royalties?—Yes. My suggestion was certainly limited to that. I have not sufficiently gone into the question of the unknown coal. I should be rather callous about any respect to private rights in that connection.

12,669. Would it not arise from time to time as new coalfields were discovered?—Possibly it would, but I should feel very much inclined to vest all unknown coal in the State straight away.

12,670. Could you justify paying people because it was known there was coal under their land, and not paying landowners when coal was discovered in their land?—Of course there are always difficulties in marginal cases. You will remember that I pressed, as the ground for compensation, the disturbance of an established income. I do not think you are quite entitled to pay so much regard to an income that has not arisen.

12,671. Surely people who have ground always have expectations that there may be coal there?—I should regard that rather lightly.

12,672. I suppose you are aware that the people who own the surface claim the ground down to the centre of the earth?—Yes.

12,673. We used to be taught that Hades was in the centre?—Yes.

12,674. And it is said that there is considerable heat in Hades. Suppose they discover that the heat could be used, would you pay a royalty rent for that?—No, I do not think so.

12,675. I suggest that the common impression that the owner owns everything down to the centre of the earth and up to the Heavens goes beyond what the laws now provide?—I do not think we are going to be at all scrupulous when cutting for underground tubes, for instance, about paying anything for compensation. We are not going to have regard to the landowners' rights in the air, and accordingly I think I should try to limit the compensation to royalty owners who know where the coal is. I am not prepared to say that there may not be marginal cases which may have to be dealt with, but I do not at present advocating compensation for the unknown coal.

12,676. Do you know of any single landowner who by his own efforts or expense has discovered the coal?—No, I do not; but you must remember that though the landlord may not act for himself he may hire somebody else to act.

12,677. Do you know of anybody who has hired anybody else?—Not directly hired, but, of course, by making a contract you in effect hire a man.

12,678. We have some pretty deep collieries here where private capital has in the first place bored to many hundreds of yards depth: have you ever heard of any of them being down to a depth where the landlord has not claimed a royalty?—An owner claims the soil right down to the bottom. I can only say that the law is changing on that point. When the tube railways were built under London no compensation was given for the infringement of the landlord's supposed right down to the bottom of the earth. We ought not to go on repeating the landlord's shibboleth that he owns down to the bottom.

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

12,679. I suppose you know that they are willing to give up any claim to the air above 2,000 ft.?—I am not aware of that, but I think they will have to come down.

12,680. You said one extraordinary thing, and that was that you were willing to leave outside of nationalisation the pits of the collieries owned by firms who were also iron and steel firms. Do you know that is a very considerable portion?—Yes, I believe it is. I only made that suggestion in order to make the transaction a little more easy. It might be found more convenient to take them over, but I was throwing out the suggestion as one that might be borne in mind—that in so far as they only supplied themselves it might not be necessary to interfere with their coal production.

12,681. Are you aware that any such thing has not been before the Commission or the miners in all their resolutions?—No, I did not realise that.

12,682. Would you be surprised to know that so far as many steel and iron works are concerned they own amongst them hundreds of collieries?—I should have thought that was rather a large number. I know that they have a good many.

12,683. Take the case of William Baird & Co., which is an iron firm: they own a very large proportion of the collieries in Ayrshire?—Yes.

12,684. A considerable proportion of the collieries in Lanarkshire and some in Stirlingshire. Did you mean to nationalise the mines of the country and leave those mines in the hands of William Baird & Co.?—Certainly that was the suggestion I made—in so far as they used the coal for their own factories.

12,685. Unfortunately, you did not say you would nationalise the pits producing coal for steel making. You said you would not nationalise the pits of iron companies, but if they had more coal than they wanted they could sell to the nation?—That was the suggestion I made—perhaps without sufficient consideration. It may be that I was wrong, and it would be found more convenient to take over the collieries. I believe there would be no physical or financial difficulty in separating the collieries from the steel or iron works. It would be quite possible physically to separate them and leave the ironworks in private ownership, and it would be quite possible financially to do it.

12,686. You know generally they say they keep the accounts of both the iron and the steel side and the coal side absolutely distinct?—Yes, I believe they do.

12,687. I suppose you have heard it said that sometimes when a claim for an increase in wages was made on coalmasters who were also ironmasters at the time on the ground that they were doing well, that the mine owners said that they were making all their profits out of the iron side of the business?—I know that is said.

12,688. And the reverse is the case when the iron men applied for an increase; they said they were making all their profits on the coal side?—Yes, that unfortunately has been said.

12,689. Would it not be rather dangerous to begin to trifle with a great industry of that kind by leaving any collieries with them at all? Should they not be put in the same position as the iron and steel makers who have no pits?—I do not altogether hold to excluding those collieries from nationalisation. It was a suggestion put that it might be a lightening of the ship, but if it is not a lightening, it would be better to take them all over.

12,690. That raises another difficulty that Mr. Forgie put to you, that during the dull period or bad period in iron or steel there are bound to be a considerable number of miners idle?—Yes.

12,691. If your position had been carried out of leaving the coal mines owned by those firms in their own hands, there would only be their own men idle?—Yes, that would certainly be an unfortunate concentration of unemployment which ought to be avoidable and would be avoidable if the reduction in production could be spread over the whole industry or if the men could be shifted.

12,692. In view of the extent of coal mines in the hands of the iron and steel people, and in some cases they are also shipbuilders—in view of that, would

you not rather change your position on that matter?—Yes, certainly. I think the points you have mentioned indicate that it might be better not to make the exception which I perhaps rather rashly suggested.

12,693. Is there any other form of profit to the nation than financial gain? It was put to you again and again, and I quite understand why it should be put from the employers' point of view, because their minds always run on profit—it was put to you in another way that the nation would not secure considerable profit other than financial gain. If you can save to the nation, as well as to the mothers of the nation, the thousands of babies who are now killed because of their environment and surroundings, if the nation by taking over the mines can improve the conditions and can save to the nation those thousands of babies, would that not be a profitable transaction from the nation's point of view?

—Yes, I would go further and say it is the only profitable transaction; but, of course, there are many other cases, not merely the accidents that I spoke of which might be saved, but also, coming to pecuniary matters, a mere reduction in the price of coal would be an enormous profit to the nation, and yet it might be the very reverse of profit to the Mining Department.

12,694. Of course, if the nation takes over its mines, it would expect to develop them to a greater extent than they have been developed up to the present time?—Yes, certainly.

12,695. You would expect the nation to take advantage of our knowledge of machinery to introduce the most up-to-date machinery into the mine?—Yes.

12,696. You would expect many of our underground roads on which men and boys are now hauling coal either as pony drivers or hand drawers for thousands of yards—you would expect that they might be taken in hand by haulage improvements?—Yes.

12,697. Would not that tend to lessen the number of accidents on the main roads?—I believe it would. I quite imagine the Minister of Mines expressing his surprise that there was any hand traction at all. He would say, "In this twentieth century you do not mean to say you are dragging coal by hand or even by ponies?"

12,698. You think that the nation would take advantage of all the information it had, and all the ingenuity that man had displayed, in trying to make the mines safe?—I think so, and I think that it would be very much more easy to get that knowledge and those suggestions to work in a mining research department or in a Ministry of Mines than it could possibly be among 1,500 separate mining concerns which do not know what each other is doing.

12,699. You have heard it said that a large proportion of accidents in mines is from falls of roofs and sides?—Yes.

12,700. There has been an anxiety on the part of mining engineers and mining reformers and miners for a considerable time to endeavour to improve the safety from accidents of falls from roofs and sides?—Yes.

12,701. Are you aware that in France a good many years ago they introduced a new system of timbering at the face? Have you heard of the scientific timbering of the French mines at the coal face?—I am sorry to say I have not.

12,702. You are aware that a very large number of the men and boys are killed at the coal face itself?—Yes.

12,703. Supposing I give you some figures from a colliery where there was a great explosion. In 1870 the death rate from falls of roof and sides per thousand persons was .87, and per million tons of coal 3.21; in 1871 it was 1.77 per thousand and 6.87 per million tons of coal raised. Figures are given published by our own Government in a blue book from 1880, and they graduate in this way: from falls of roof .83 per thousand, and 1.75 per million tons raised until we get down to 1888, when per thousand persons employed it was .36, and per million tons of coal raised .91; and as you come along right

30 April, 1919.]

MR. SIDNEY WEBB.

[Continued.]

down to 1899, the death rate has practically disappeared altogether. There were no deaths at all in 1890, and in 1899 .18 per thousand persons employed and .52 per million tons raised. That is held by the French authorities to be because of their method of timbering at the face.—That of course is very striking. I should like to say that the Home Office report of 1917 contemplates the possibility of a reduction of accidents by 50 per cent. It does not say so in so many words, but it gives a very long explanation of what has been done in a factory in the north of England, and it says: "The result of these new measures has been in a single year to reduce the number of accidents in the works by more than 50 per cent. I desire to urge upon the owners, management and workmen at mines the desirability of setting up Safety Committees on similar lines to those described above with as little delay as possible. If such committees carry out the work zealously and in the spirit in which such works should be carried out, the result, I feel convinced, will be the prevention of a considerable number of accidents." Quite clearly, in the opinion of the Home Office Mining Department, it is possible to prevent a considerable number of accidents.

12,704. I suppose you are of opinion that the Home Office has to the best of its ability endeavoured to have introduced into the mines all safety appliances?—Yes, I think it has a long and honourable record in that way, but it is only fair to say that the staff is very small, and, if I may point out, even now there is no proper health department at the Home Office. There is no technical expert responsible for considering how to prevent the miners' diseases, and we are dependent on mining engineers and mining inspectors for advice to the Government on the prevention of miners' diseases.

12,705. It is a very considerable time since the question of baths at mines and the drying of miners' pit clothes at the place has been agitating the minds of yourself and the leaders of the miners generally?—Yes.

12,706. It has been established on the Continent a good many years ago?—Yes.

12,707. It was universal in Westphalia for many years?—So I understand.

12,708. They had it in France, also in Belgium, and the United States of America—it is very common there—both bathing and drying at the pit?—Yes.

12,709. I would not have called your attention to this but for the fact that you fell into the error of saying that the question of baths was before the House when the 1911 Act was passed, but that owing to the opposition of the employers it was abandoned. It was not abandoned. It is Part 3 of the Act?—Yes, I am aware of that. What I meant was, if I did not express it, that the important point is this, that in 1911 the Cabinet had decided that pithead baths should be universally compulsory, and it was that which was abandoned in consequence of the opposition of the mining industry.

12,710. Then they are, as a matter of fact, compulsory to-day under certain circumstances?—Yes.

12,711. Not the taking of a bath, but the erection of a bath is compulsory. It is Part 3 of the Act?—Yes.

12,712. I want to call your attention to Clause 77, where by ballot of the persons employed there is a two-thirds majority in favour and they are willing to undertake to pay half of the cost of erection and maintaining, but that cost must not come to more than 3d. per week for each workman liable to contribute under the section. Is that the provision that the employers, in order to kill the baths question, got put in?—That was the clause that was put in, and I am always very careful in not saying that the owners did it, but that somebody did it for their advantage in the way which has actually obstructed the putting in of baths under this clause ever since.

12,713. I put it to you that you are more careful on this point than you are on many others?—I am fully convinced that it was the opposition of the mining industry which caused the abandonment of the uni-

versal provision and the reduction of the clause to this inoperative form.

12,714. Have you been in any of the single-apartment miners' houses?—No, I have not.

12,715. You have heard and read that there are such things?—Yes, not only some, but a very large proportion of the miners' houses in Scotland are single-apartment houses.

12,716. There are such cases as where two or three children and the mother and father and sometimes the father and the son, both working in the pit, are in one room?—Yes.

12,717. You are aware that the miner in many cases comes home from the pit wet through, his shirt, his drawers and his trousers wet, either by moisture of the mine or sweat?—Yes.

12,718. You are also aware that the only place where the clothes can be dried is round the single fire of that room or kitchen?—Yes, and that practically applies where there is a two-room apartment, and because there will be probably only one fire. In fact, one may go further and say in a three-room apartment practically there is only the fire in the living room, and the clothes will be dried in that living room.

12,719. The babies are born in that room?—Yes, in many cases.

12,720. The mother has to run the risk of fever and death?—Yes, that is common.

12,721. If the children are ill from fever or anything else of that kind they have to breathe the fumes from the drying of pit clothes?—That is so.

12,722. Is it any wonder that babies die in mining districts under those conditions?—I think there can be no doubt that a very excessive amount of the mortality must be due to that condition of things.

12,723. If the mines had been national property, do you think the nation working its own mines for 20 years would be still without baths at those mines?—I will not put a date to it, but I think it is quite clear that 8 years ago there would have been pithead baths if the mines had been owned by the nation.

12,724. It is no answer to say we have changed our mind since that time because a good many babies have died since that time?—That is true. It would be very difficult to impose an obligation to set up pithead baths in any extensive and comfortable way so that they would be used for all the mines of the country in private ownership. It might send some of them into bankruptcy. Therefore, it is not only the difficulty of doing it under private ownership, but I think it would be impossible to do it.

12,725. It would be impossible to do it at the worst-paying collieries?—Clearly.

12,726. If you made it a condition of law that if must be done, then whether or not they went out of production, they would have to do it?—Yes.

12,727. Do you think any of those who made a profit would help them to put them up?—I think under the ordinary process of profit-making it would be almost impious to do it.

12,728. It would be to their interest if they did go out of production?—Yes; the more successful members of trade are never sorry to see others going under. There is always something in the misfortunes of our best competitors that is not displeasing to us.

12,729. *Mr. R. W. Cooper:* With regard to rates and taxes, if the collieries are taken over by the State, would the Coal Department pay the rates and taxes at present payable by the colliery owners?—Clearly, yes; unless there were some other arrangement made, that would be the ordinary course of English procedure, that when property is in the hands of the State, it does not actually admit that it pays the rates like a private individual, but the Treasury makes a contribution in lieu of rates which is supposed to be equivalent to the rates.

12,730. Therefore, I suppose, in ascertaining the commercial result of the Coal Department, these rates and taxes would have to be provided for in striking the balance of profit and loss?—Certainly the rates. I must make an exception with regard to taxes. I do not think that the State enterprises debit themselves

30 April, 1919.]

MR. SIDNEY WEHL.

[Continued.]

with the taxes; perhaps they ought to, but the question does not much arise, because they would not in any case debit themselves with income tax, which is not an expense. The only question would be in-

habitated House Duty, and I am not sure that they debit themselves with that; they ought to do so, that is all I can say.

(The Witness withdrew.)

Chairman: I promised to circulate the Trade Dispute Act of 1906 and the Act of 1913, and I do that now. Another member of the Commission desires to

give evidence; that is Sir Leo Chiozza Money, and I will call him at once.

Sir LEO CHIOZZA MONEY, Sworn and Examined.

12,731. *Chairman:* I think that you have been engaged on administrative and advisory work from the very first week of the war? You are the late Parliamentary Secretary to the Ministry of Shipping, and you are the author of numerous works and articles on economic subjects?—Yes.

12,732. I think it would be satisfactory, if it meets with your wishes, that you yourself should read the proof you have been good enough to supply to us, and we will follow it while you do so.

Witness:

"(1) The case for the Nationalisation of the Coal Industry is based upon the following grounds:—

- (a) The vital importance of coal in the national economy.
- (b) The need for the greatest possible conservation of coal.
- (c) The greater economy of unified control, especially under Nationalisation.
- (d) The superiority of public service, as compared with working for private gain, as an incentive and spirit in industry.
- (e) The recognition of the need to associate every person engaged in the industry with the conduct of its economy, as far as that is practically possible

(a) THE VITAL IMPORTANCE OF COAL IN THE NATIONAL ECONOMY.

(2) Modern industrial wealth is for the greater part based on Power derived from Coal and Britain, the United States and Germany alike have risen to industrial greatness because they happened to be the three greatest coal-owning countries inhabited by white peoples. Between them they produced before the war more than eight tons out of every ten tons of coal produced by all the world. The history of the Industrial Revolution in Britain, which changed the poor agricultural State of the eighteenth century into the comparatively wealthy Britain of the nineteenth century, is also the history of our coal industry. The Commission is thus given the great responsibility of arriving at determinations which affect not a single trade but all trades, and, indeed, the degree of our future prosperity.

(3) Coal is not only the greatest practical source of power yet known to science but, as was pointed out by Jevons, it acts as a magnet to raw materials because its bulk and weight make it most economically used at or near its place of production. Hence Britain, a small island with good ports, is an ideal workshop, since materials can readily be brought to its coal power. But the potency of coal in the national economy goes further; it is also the source of our shipping greatness, since it furnishes bulky outward cargoes to balance our bulky imports of foods and materials, thus enabling our ships to earn money both inwards and outwards. But for coal our ships would largely go out in ballast since, although our exports of manufactures are great, their bulk or weight for value is comparatively small. Thus production, ample supplies of cheap materials, and shipping are alike seen to be based upon our coal mines. These things are well known to the Commission, and they are stated here in the briefest terms consistent with accuracy in order that all the aspects of the problem may have consideration in this evidence."

Perhaps I may remind the Commission that Jevons said that coal was almost of religious importance.

"(4) It is suggested that, in view of the primary importance of coal, without which these islands could not support more than one-third, if as many, of their present population, it is inconsistent with national safety and welfare for the ownership, control and disposition of our coal resources to be resigned to private interests, the irresponsibility of which has abundantly appeared in the history of the trade. It is true that no evil exists to-day of the dimensions of the 'limitation of the vend,' which was so vigorously denounced by Porter in his 'Progress of the Nation,' and which for three-quarters of a century taxed our people and, by restricting coal production, frustrated British progress."

12,733. *Chairman:* Have you Porter here?—Yes. Porter had a great deal to say about the limitation of the vend.

12,734. For the benefit of the public, who may not know what the vend means, you might say that it was a way of dealing with coal at Cardiff?—From 1770 down to nearly 1850, a period of three-quarters of a century, there was a combination of coal producers. This combination ruled the output of every mine.

12,735. *Mr. R. W. Cooper:* You mean they regulated the amount to be sold?—And produced—and regulated the prices for inland consumption, and sold the surplus abroad at prices lower than at home, so that foreign manufacturers got coal very cheaply while the British manufacturers got it at a dear rate. The London householders got it at 30s., while it was being sold at St. Petersburg at 18s.

12,736. *Chairman:* Anybody who wants to see the exact working of the limitation of the vend had better look at the report of the coal trade for 1830, when the Town Clerk of Newcastle gave very considerable evidence about it, and explained the full system as to how it works?—Porter says in this way: during three-quarters of a century (this was written in 1847) every person using seaborne coal in Great Britain was exorbitantly taxed for the benefit of rival manufacturers in other countries.

"Nevertheless, the spirit of commercialism which inspired that private system of taxation by coal producers remains and can only be exorcised by national dictation of what shall be done with national coal. As to the landowners' property in coal, it is indeed remarkable that a freeholder should be held in law to possess not only the fee simple of the surface but of whatever minerals may lie below it and at whatever depth they may be made available by science. As a wise and witty French economist, Professor Charles Gide, of Paris University, has said, this absurdity 'represents the landowner as possessing a pyramid, whose vertex is the centre of the earth, and whose sides are prolonged into infinity.' The verities of physical science, indeed, are strongly at variance in this matter with the conceptions of property which have been erected into law by property-owners.

(5) The private ownership of that part of the interior of the earth which lies under the British area cannot, as it seems to me, be defended on any reasonable grounds, and I am strongly of opinion, therefore, that such ownership should be forthwith determined. It may be added that it would be at once equitable and a piece of good business for the nation to pay out the landlords, say at 10 years' purchase of existing coal rents and royalties, the

30 April, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

State entering into possession of all minerals at present unworked or unproved.

(6) Generally, the nationalisation of coal would mark the beginning of a proper State responsibility in respect of the coal supply, and substitute direct downright action for the present system, which may be defined as the timid regulation of, and interference with, the irresponsible private government of the national coal resources by a host of private unco-ordinated agencies of greatly varying degree of competence.

(b) THE NEED FOR THE GREATEST POSSIBLE CONSERVATION OF COAL.

(7) Of the three great coal nations, Britain, the United States and Germany, our own country, unfortunately, has the smallest supplies of coal. Estimates of coal, especially in unproven fields, must necessarily be somewhat speculative, but there is no doubt that the following figures, which I take from the work of the last Royal Commission on the Coal Supply (1905), give a fair approximation of the facts of the case:—

Comparative Coal Resources of Britain, the United States and Germany.

	Millions of Tons.
United Kingdom	146,000
United States	1,400,000
German Empire	415,000

In proved coalfields under 4,000 feet deep the estimate for Britain is 100,900 million tons.

(8) We do not know whether or not science will dethrone coal as the main practical source of power before the British coalfields approach exhaustion. It is, however, abundantly clear that Britain has much less coal than either of her two great industrial rivals. Few will be inclined to dismiss this question by enquiring, as Napoleon is said to have enquired, "What has posterity done for us?" The view of the Commission cannot fail to be that of the American Conservation Commission, which, dealing with the magnificent resources of America—which, as it pointed out, have been already largely wasted by private enterprise—made this observation:—

"The duty of man to man, on which the integrity of nations must rest, is no higher than the duty of each generation to the next; and the obligation of the nation to each actual citizen is no more sacred than the obligation to the citizen to be, who, in turn, must bear the nation's duties and responsibilities."

Our duty plainly is (1) to conserve our coal by every possible means, and (2) to regard the remainder of the Coal Age as a period in which, by national organisation and national training, to prepare our people for their coal-less future, whether that coal-less future result from the exhaustion of coal or the dethronement of coal.

(9) The last Coal Commission had a good deal to say as to the waste of coal, and all that it said is, with negligible reservations, true to-day. The Commission pointed, *inter alia*, to the following sources of waste in working as of importance:—

- (a) Much coal had been, and still was, being lost in barriers, although large area leases were tending to reduce that factor.
- (b) The establishment of central pumping stations would save much coal.
- (c) There was room for the application of better methods of working of thick seams.
- (d) Inferior and small coal was frequently left in the mines.
- (e) The advantages of the extended use of coal-cutting machinery were dwelt upon, and figures given to show that in 1903 only 5½ million tons of coal were got by machinery. (This figure grew considerably in the war, but is still small.)
- (f) The use of hydraulic cartridges was referred to as being both safer than shot-firing and as preventing waste.

(g) The use of electricity in mines was pointed to as invaluable both from the point of view of economy and efficiency.

(h) It was indicated that there was room for economy in the preparation of coal at the pithead.

The Commissioners also showed that the collieries are themselves amongst the greatest wasters of coal as users. They said, "It is beyond question that collieries are extremely wasteful in the consumption of coal, no doubt to a large extent because of the small value of the fuel used, which is generally of very inferior quality." They went on to say, "It was stated by one of the witnesses that if the whole of the plant of the collieries were modern plant of the best description, the consumption of coal would be one-half of what it is to-day." The consumption in question is 14 to 18 million tons per annum, or more than the whole production of India, Australia, or Canada.

(10) As to industry generally, a grave indictment was brought against the economy of private industry. It was shown that the consumption of coal per indicated horse power per hour was about 5 lbs., whereas it should not exceed 2 lbs., and might even be less.

"If all steam engines were as efficient as the best, 50 per cent. of the coal now used for steam raising might be saved."

That would mean a saving of about 26 million tons of coal per annum. On this head the Coal Conservation Committee of 1918 said that "the present coal consumption would, if used economically, produce at least three times the present amount of power."

(11) The Commissioners also referred to the grave waste in the coke manufacture, and spoke of the "prejudice against by-product coke ovens being gradually overcome." Unfortunately, this prejudice had been so little overcome at the time the war broke out that the nation found itself in grave lack of valuable by-products which it needed for war purposes and which, of course, are equally valuable for peace purposes.

(12) The waste of fuel in our iron and steel manufacture is worth particular attention. It will be remembered that evidence was given to us to show that 4 tons of coal were needed to make 1 ton of steel. I was able to show that such a consumption was unnecessary in the best modern plant. This was also pointed out in an Appendix to the Report of the Coal Conservation Committee, consisting of a Memorandum by Mr. Benjamin Talbot, who showed that under good modern practice the total fuel required per ton is only 35 cwts. Professor Bone puts the figure at 1.6 tons of coal per ton of finished steel.

(13) The Coal Conservation Committee of 1918, under Lord Haldane, dealt in particular with the great advantages to the national economy which would arise from the creation of great central power stations which, it was held, would save 55 million tons of coal per annum in respect of power purposes alone, to say nothing of domestic uses or of the possibility of extracting valuable by-products before consuming the coal for power purposes.

(14) Not less remarkable than the waste in getting coal and the waste in coal actually got, is the national neglect to explore our coalfields. Professor W. W. Watts devoted his presidential address to the Geological Society of London in 1912 to this important subject. He pointed out how much coal had already been wasted through the imperfect working of rich areas, through the neglect of drainage, &c., and other causes, and pleaded for a systematic survey of our coalfields as a national necessity and as a profitable investment. He referred to the fact that in Eastern and Southern England there exists a great area of covered Palaeozoic rocks which ought to be explored "by means of a considered series of borings." This, as he said, "would introduce a new practice into British institutions," but similar methods have been employed abroad. He added, "It is urged that the close dependence of the future of the nation on its coal supplies justifies a new departure, and that it would be a wise act of statecraft to take deliberate

30 April, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

measures to devise a comprehensive and well-considered scheme of exploration, the results of which might be at hand for application before the growing scarcity of coal shall have begun to produce its inevitable economic consequences upon the manufactures and upon the very conditions of existence in this country.

(15) I think that the cumulative effect of these many considerations is to point to the urgent necessity to take national control of our power resources, that we may make quite sure that nothing is left undone to utilise every factor of economy to the highest possible degree. The matter is too grave to be entrusted to many different hands working in many different ways, and actuated mainly or solely by motives of present private profit. Moreover, as the Government has very wisely decided to nationalise the super-power stations, recommended by the Coal Conservation Committee, it would appear exceedingly illogical to leave under the private control of some 1,500 different coal-owners, themselves not proprietors but lessees, the irreplaceable raw material required to feed the national super-power stations.

(c) THE GREATER ECONOMY OF UNIFIED CONTROL,
ESPECIALLY UNDER NATIONALISATION.

(1) In Production.

(16) It is contended that the factors of waste referred to in the last section cannot be adequately dealt with save under unified control, and that the most economical method of applying unified control is through Nationalisation, because the advantages which the State possesses in point of credit make it possible to find capital for improvements at a lower cost. The same observations apply to the technical improvements referred to in the valuable evidence of Sir Richard Redmayne, as for example the matters of underground conveyance, the utilisation of upcast shafts for winding, the greater use of two-deck cages, and the improvement of winding-plant and engines. It is difficult to see how many of the collieries whose equipment is at present inferior can afford to raise adequately their technical standard.

(17) There can be no question that amongst our many different colliery managements there is wide variation in point of efficiency. A unified system under which the British coal-fields were divided into proper areas of district control could apply the best brains in the coal industry to the entire field of operations, whereas at present their gifts are applied within a narrow orbit. Our coal-fields, of course, vary widely in their character and methods of operations. To each respective area we could apply the best suitable practice of the area, entrusted to the supervision of its best men.

(18) Very great importance should be attached to the question of costing. As was pointed out by Mr. M. Webster Jenkinson, C.B.E., in his paper, read to the Industrial Reconstruction Council, a properly devised costing system periodically brings to light the reasons for any change in cost of production, and indicates whether it is due to inefficiency of plant, or to waste of material or product, or to breakdowns from whatever cause, or to the actual efficiency of labour. The unified control of mines would reveal comparative costs and enable us to raise the general standard.

(2) Distribution.

(19) As to distribution, the problem will undoubtedly be solved eventually in the most satisfactory manner by the all-electric plan. In the meantime there is much evidence to show that the present complications of coal-dealing are exceedingly extravagant. This need not surprise us, for it is a commonplace of commercial distribution, from milk to cabbages, and from coal to herrings. In all distributive trades a host of unnecessary middlemen stand between the producer and the consumer. The organisation of a suitable system of domestic distribution through municipalities, with a single coal administration in each town, would appear to be an inherently simple business, the details of which could be worked out by any ordinarily well-equipped man of affairs.

As to the export trade, there would also be great advantages. Sir Richard Redmayne has pointed out how unification would prevent competition and lead to the obtaining of better export prices, and that it would place the trade in a better position *vis-a-vis* the shipowners. Under nationalisation we could establish an Export Department which would possess advantages, not at the disposal of private individual merchants, and we could probably effect bulk sales to the Governments of France, Italy and other countries for their re-sale and distribution. The latter form of export will, it is probable, become an increasing factor in the world's exchanges, not only in coal but in wheat and wool and many other things.

It is important to point out in this connection that it would be folly for the nation to rely upon an indefinite continuance of the whole of our coal export trade. That trade largely consists of the sending of coal abroad for the use of steamships."

That is for steamships picking up abroad. I am not referring to bunkers. "It is not improbable that the use of coal in all types of vessels will become obsolete in the near future and, if so, one of our relative advantages in the shipping trade will disappear. This point, to my mind, makes it of the greater importance that we should achieve the maximum economy in respect of coal for the benefit of the remaining national factors of wealth.

(d) THE SUPERIORITY OF PUBLIC SERVICE, AS COMPARED
WITH WORKING FOR PRIVATE GAIN, AS AN INCENTIVE
AND SPIRIT IN INDUSTRY.

(20) In the evidence that has been put before us a good deal has been said about the incentive of private gain as a factor making for industrial efficiency. I am at some loss, however, to understand where evidence has been found that private enterprise has met, or is meeting, the needs of our time. The Industrial Revolution did not occur yesterday. It began in 1750, when Abraham Darby the younger, first smelted iron with coal. That is 169 years ago. James Watt took out his steam engine patent in 1769. Three generations have elapsed since George Stephenson built his 'Rocket.' Volta made his great discovery 119 years ago, and Faraday discovered magneto-electric induction in 1831, nearly ninety years ago. These great landmarks in invention remind us that private enterprise in the use of inventions has had a very long run, and yet, as we know, the greater part of our population is living in poverty, and we have had to deplore, during the exigencies of ordeal by battle, the revelation of a great proportion of C3 recruits. The Census of Production of 1907 showed, as I pointed out just before the war began, that of our male population aged 18 years and over only about one in three was engaged directly in producing industrial wealth, including coal, and that, after allowance was made for agricultural workers and distributors and for necessary professions, it was clear that the nation contained an army of people who were not properly organised for wealth production. This was further proved by the war, towards the end of which we were able, after diverting to the Army and Navy the majority of our best workers, to obtain a maximum production of food and munitions, but only through national organisation. I cannot help thinking that in these circumstances a great deal of explanation is needed from those who contend that the incentive of private gain is the best way to call out the best energies of a nation. Especially this seems necessary after a war in which it has been most happily demonstrated that millions of men are ready to serve their country, not merely without hope of gain, but with a certainty of loss.

(21) Nor is it sufficient to allege that public spirit in war cannot properly be compared with public spirit in peace. If that were true it would be a misfortune for the human race. I think there is a good deal of evidence to show that it is not true. An outstanding example is the Panama Canal, which the genius of De Lesseps, an enormous amount of French capital, and the sacrifice of many lives by private enterprise, failed to complete. Central America obtained a scandal, but not a Canal. Under American national

30 April, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

enterprise the failure was redeemed, lives were saved, and the world presented with a new wonder. It is notable that in the course of the national operations men showed themselves capable of risking their lives by submitting themselves to experiment in connection with yellow fever and malaria, the success of which experiments made the enterprise possible. Again, in the course of the war it was shown how a number of our most capable captains of industry became temporary Civil Servants, and as servants of the nation, often administered and even initiated acts which struck at their own trade interests."

I have had personal observation of this myself: "We may contrast with this conduct the considerable number of cases in which private traders who had not become public servants were not sufficiently regardful of the national interest. The contrasts which obtained were not so much due to difference in character as to difference in point of view.

(22) Indeed, those who favour the conception of Nationalisation accuse, not individuals, but a system. The suggestion I make is not that those who possess capital in the mining or any other industry are less public-spirited than those who do not own capital. The suggestion is rather that an individual engaged in exploiting private ownership (as some individuals must needs do as long as the nation will not employ capital for itself), has unfortunately to work a system which scarcely enables him to look at things from a national point of view. This is particularly true of managers of businesses who have to answer to shareholders who look for a return on their investments. That is an unfortunate position for a man who, for example, has to weigh the advantage which would accrue to the workpeople in his charge from the spending of £10,000 on better safety appliances or welfare work. It is not fair to any man, however good his character, that he should be put in such an invidious position.

(23) It is, unfortunately, the case that coal in many of its uses had been gravely neglected by private enterprise before the war, and this in spite of repeated attempts by many economists to direct attention to the neglect. Little serious attempt was made to extract the by-products of coal, which yield a host of valuable resultants, from dyestuffs to medicines, and from photographic materials to explosives. As a consequence, when the war broke out, what had been a neglect for peace purposes was revealed as a neglect which hit us hard in respect of war purposes. The Ministry of Munitions, more accurately I should have said the War Office and the Ministry of Munitions, by setting up an Explosives Supply Department under Lord Moulton, retrieved the situation, which was a very serious one. Indeed, it is not too much to say that national enterprise during the war did in two years for the chemical industry more than had been done for it in many years by private enterprise. Amongst other things, it formed a Potash Production Branch, which triumphantly succeeded in making our blast furnaces potential suppliers of potash, which had been hitherto a German monopoly. But this is to name only one branch of the great work of the Ministry of Munitions, which, from steel to fine gauges, and from "tanks" to optical glass, gave us a number of new industries, while magnifying many old ones. It will not do to attribute the tremendous success of the Ministry of Munitions to lavish expenditure. The point is, that in the arguments I have referred to it is alleged that State Departments crush enterprise and stultify initiative. Nor is it an answer to say that men trained in private enterprise helped the Government Departments. That argument is its own refutation, for, obviously, the men were just as clever before they entered the Ministry of Munitions, and they had all the alleged incentive of private gain to urge them to make use of their cleverness. Why, then, did not that cleverness yield us in peace the industries which were so rapidly created by the Ministry of Munitions in a couple of years? The true and conclusive answer to this question is that public enterprise alone can give a man full opportunity to use his powers for his fellows.

(24) In connection with the munitions work, it may be pointed out that Mr. Winston Churchill, late

Minister of Munitions, who was a very determined opponent of Socialistic ideas, made the following statement on January 22nd, 1919."

12,737. *Chairman*: This is Mr. Winston Churchill?—Yes, when he addressed the staff of the Ministry of Munitions. It was in the course of an address to the staff.

12,738. *Sir Arthur Duckham*: After dinner?—Yes.

Sir Arthur Duckham: I was present.

The Witness:

"I have not been quite convinced by my experience at the Ministry of Munitions that Socialism is possible, but I have been very nearly convinced. I am bound to say I consider, on the whole, the achievements of the Ministry of Munitions constitute the greatest argument for State Socialism that has ever been produced. To regulate from a Government office affairs of the variety and scope that we have been dealing with is a feat which has never been attempted before, and that it should have been done with such a great measure of success constitutes a new factor in the political history and experience of the world."

I do not know how anyone acquainted with the work of the Ministry of Munitions could differ from Mr. Churchill's verdict. The Department scored a series of industrial triumphs too numerous to be catalogued here, but as to which I hope evidence will be called before this Commission. One of the greatest of them was the construction of the works at Gretna, near Carlisle, which cost £10,000,000, but which saved the nation much more than that sum by reducing costs and prices. They form a model of industry as it ought to be carried on, but as unfortunately it is not carried on, with a splendid accompaniment of good housing and provision for social welfare.

(25) This point is of such importance that I give a further illustration. In 1916, with the enemy submarines in action, it was abundantly necessary to use ships to the best advantage and to get stocks of foods and materials from the nearest markets. But private enterprise did not respond to the war necessity. We did not find our shipowners forming, as they might have formed, a central committee to take cargo liners out of their regular trades and to run them where they were most wanted. Indeed, there were fine ships owned by British shipowners not coming near the United Kingdom at all. It remained for the Ministry of Shipping to make the necessary organisation, so that ships were taken out of far trades and put into near trades, so that British ships which did not touch our shores were compelled to make British ports. As a result, in 1917, although we had 20 per cent. less British ships owing to enemy depredations, the greatly reduced British tonnage brought in as much cargo as the much larger British tonnage brought in in 1916. Thus again the nation saved itself by national organisation.

(26) I do not think that it can be contended that the coal industry, if nationalised, would be unable to command the services of the best available men. I cannot believe that if the coal industry were made a public service it would not attract the most eminent coal experts that we possess. The nation can offer a coal expert a greater and more honorable position than any he can possibly occupy even under the most efficient and most public-spirited of our colliery companies. It is surely not a reflection upon coal-owners to say this. I cannot conceive myself, and I cannot conceive any other man, as regarding opportunity under a public coal service as any but a great and coveted opportunity.

(27) All over the world, in national and municipal undertakings of many different kinds, there are engaged men of outstanding merit who are proud of their positions and who serve the public faithfully and well. If it were otherwise, how could the State railways of, for example, Australia, or New Zealand, or Belgium, or Prussia, be the success that they are, or how could the municipal tramways, gas undertakings, and electricity works of the British municipalities yield such successful results as are actually on record?"

30 April, 1919]

SIR LEO CHIOZZA MONEY.

[Continued.]

12,739. *Chairman*: You have some remarks to make on public criticisms?—Yes, I wanted to add a few words on that. I am of opinion that one of the greatest safeguards the nation has in public enterprise as compared with private enterprise is that the public expect more of it and criticise it more freely and grumble as they would not grumble if the goods or the service were connected with a private enterprise; that is to say, they will stand from a private railway company an untidy, disordered and inconvenient railway station, but if that were a public railway station, it would be complained of at once. There would be letters in the newspapers and questions in Parliament, and people would not stand it. It is always the experience in all countries that public enterprise meets with furious criticism, which is a good thing which will continue, and to my mind will yield satisfactory results. Then I come to section (c):—

“THE RECOGNITION OF THE NEED TO ASSOCIATE EVERY PERSON ENGAGED IN THE INDUSTRY WITH THE CONDUCT OF ITS OWN ECONOMY, AS FAR AS THAT IS PRACTICALLY POSSIBLE.”

(28) The miners are definitely asking for a lot and part in the management of the coal industry. It is not a bureaucratic government of the industry which is aimed at, but an industrial constitution in which due regard shall be paid to:—

- (a) The interest of the nation as a whole, which is sometimes imperfectly expressed by speaking of the “interest of the consumer.”
- (b) The interest of the miners as producers.

As is usually the case when new proposals are made in regard to any subject, those who made them are asked to produce an ideal detailed plan. There never can be such a thing as an ideal detailed plan for the conduct of human affairs. But, although we cannot pretend to counsels of perfection, it is certainly not difficult to devise not one plan, but several plans, embodying the conceptions of Nationalisation and Democratic Control, each with merits far superior to the present system of irresponsible private control by many unco-ordinated agents. I have no doubt that different nations could nationalise their coal industries by systems differing widely in point of detail, and yet with almost equal success, just as in the world as it exists there are municipalities in different countries trading in different ways but with equal success.”

or, as I may add, there are different railway companies under different systems of working and yet managed with quite equal success:

“(29) The essential points which need to be incorporated in the nationalisation of the coal industry are, as it seems to me:—

(a) A Minister of Mines, responsible to Parliament, who is head of an Executive Council, or, in commercial language, a Board of Directors. It is not valid to object that the Minister would be deprived of Ministerial responsibility because he was head of an executive and not of a purely advisory council. As a matter of common sense, the Minister would carry on just as a managing director carries on, until and unless he and his council or board vitally disagreed. In the war the Shipping Controller was none the less responsible to Parliament and to the War Cabinet because he was Chairman of the Shipping Control Committee, which in practice became a sort of Shipping Controller’s Cabinet.”

My idea is that this body should be a cabinet to the Minister.

12,740. *Chairman*: In line 4 of that paragraph (a) does “would” mean “should”?—It is “would.” The criticism has been made on that that if his board was an executive board he could not go to Parliament, because you would not have so much personal responsibility. That is the point I want to make.

“(b) A Central Mining Council, with executive powers, whose chairman is the Minister of Mines. This Council to consist of:—

- (1) Technical experts appointed by the Minister.
- (2) Organising experts appointed by the Minister.

- (3) Representatives of great industries; one each for steel, textiles, and shipping should be sufficient: appointed either by the Minister of Mines or by the Minister of Commerce.
- (4) Representatives of the miners nominated by the miners.
- (5) A housing expert appointed by the Minister.”

In my opinion, although I admit it is subject to argument, the number of those representatives should be equal to the number of the remaining representatives.

With regard to (5), I want to make a change. I do not think it is necessary on reconsideration to have a housing expert. I think that interest will be sufficiently represented on the executive by the miners’ representatives. I want to substitute for (5): “A representative of Ways and Communications appointed by the Minister of that Department,” and I would like to add a word there. Although the Government, as I take it, has decided to join electricity with railways, and although I can see many arguments for that being done, at the same time, in my opinion, I think that electricity should be joined rather with the Ministry of Mines, making it really a Ministry of Power. I should like to say that in passing.

12,741. *Chairman*: In (4) what exactly do you mean by “miners”? Is it all those engaged at the colliery or simply the working men, so to speak, as distinguished from the clerical staff?—I should say representatives of the whole body of employment:

“The proportions of these various representatives is properly a matter for discussion, and probably equally good results would be obtained within fairly wide margins of variance in detail. The members of this Council, of course, to retire in some reasonable rotation and to be eligible for re-appointment.

(c) The division of the coalfields into suitable Districts, each with a District Manager appointed by the Minister, and with a District Council on the lines of the National Council.”

12,742. *Chairman*: Do you accept the present districts?—With regard to the present districts, I think it wants a little consideration. I have them here before me, and they vary very considerably in the amount of their output and size, and it is quite possible therefore that some of them might be divided, but that is a matter for detailed consideration, and does not in any way involve the principle.

12,743. *Mr. R. W. Cooper*: Are you speaking of the inspection districts or the geographical districts?—I am speaking of inspection districts. I think that is a matter for proper detailed discussion which does not affect the principle.

12,744. You mean as apart from the actual conditions of the trade?—Yes, and it wants grouping according to the trade. “(c) The division of the coalfields into suitable districts, each with a district manager appointed by the Minister, and with a District Council on the lines of the National Council. These District Councils to exercise such powers as may be delegated to them by the Central Board, the intention being to make them live and effective boards of directors with the most capable managing directors available. The number of districts is a proper matter for discussion.

(d) As to individual mine management, nothing to be done to alter the present effect of Clause 2 of the Coal Mines Act which makes the manager responsible for the control, management, and direction of the mine. The District Councils, however, to have power to appoint a Pit Council or Committee to assist the mine manager. The appointment of firemen, examiners, and deputies to remain with the mine manager as now under Clause 14 of the Coal Mines Act.”

There again it seems to me that the thing would go through a period of development. That, at any rate, is how, I think myself, I should like to begin, although it is a matter for discussion, obviously.

30 April, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

12,745. *Chairman*: What do you mean by "to assist the mine manager"? Do you mean to advise?—Yes; to advise or consult with. Just as the captain of a ship is a little tyrant in his way, and he may be a tyrant if he likes, nevertheless I take it the most wise captains of ships, if they are going into action, do have a talk with their officers before they begin. Although I think the manager should not be relieved from the responsibility of the deadly character of the work carried on in the mine, nevertheless he should take the advice and counsel of the Pit Committee, and, I take it, he would be glad to do so for his own sake, and as time went on that would develop, and you may get a quite different arrangement as matters develop.

12,746. Do you think that would be giving the men an effective voice in the direction of the mine?—Yes, I think it would; but, at any rate, that is a matter upon which there may be many legitimate opinions and differences, and which want hammering out in a great deal of detail, and I do not pretend to be dogmatic about it.

(Adjourned till 10.30 a.m. on Friday, 2nd May.)

SECOND STAGE—SIXTH DAY.

FRIDAY, 2ND MAY, 1919.

PRESENT:

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. R. W. COOPER.

SIR ARTHUR DUCKHAM.

MR. FRANK HODGES.

SIR LEO CHIOZZA MONEY.

MR. ROBERT SMILLIE.

SIR ALLAN M. SMITH.

MR. HERBERT SMITH.

MR. R. H. TAWNEY.

MR. SIDNEY WEBB.

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE (*Assessor*).MR. ARNOLD D. McNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

Chairman: I am very sorry to say that Mr. Forgie, one of our Commissioners, has been taken ill, and will not be able to be here to-day. I think he has felt rather the strain of the work of the Commission, and I am sure we all hope he will be restored to health as soon as possible.

Mr. R. W. Cooper: Sir, before we begin, may I make an application? We are about to consider certain mining questions, and we shall probably begin this afternoon the consideration of them. As we all know, there has been a Committee sitting, presided over by Mr. Leslie Scott, dealing with mining problems. I understand they have already made one Interim Report dealing with a number of mining questions, and the second report is just about finished. I suggest, although the Government have not published the first report, and of course have not published the second report, that they should be good enough to let us have copies at once for the information of the Commission.

Chairman: That is a matter for the Government. The Government, I understand, has not published

12,747. Are you willing to do the same in regard to suggestions of safety?—Yes, certainly.

"(e) The coal-owners to be paid out equitably, having regard not to war-time profits, but to the position of the industry before the war.

(30) I think we may be confident that on these lines—again I say within a fairly wide margin of variation in detail—a system of Industrial Democracy, which I define as National Ownership combined with democratic control and responsibility to Parliament, could not fail to be successful, and to give a common measure of benefit alike to the nation as a whole and to the miners who form a large section of the nation. It would have the merit of offering positions of proud responsibility to our most capable mining experts; it would afford opportunity to create the conditions of maximum economy in production and distribution; it would direct the energies of the nation to conserve its coal; and last, but not least, it would give every man working in or about the mines, whether with hand or brain, a sense of social responsibility which could not fail to lead to pride and contentment in work."

either report, and one report is not even settled, as I understand. I cannot ask the Government for reports when they have not published them. It is in the discretion of the Government to publish the reports—not me. Mr. Leslie Scott no doubt will be able to give evidence if he desires.

Mr. Leslie Scott: Mr. Chairman, may I—

Chairman: I cannot hear you. Anything you wish to say, will you please put in writing?

Mr. Evan Williams: I should like to ask for a return giving the expenses of the administration of the Coal Control Department from its inception up to the end of last year.*

Chairman: Certainly. I think that is a very proper and reasonable request.

Sir Arthur Duckham: We have had a return of the coal produced to the end of last year. Is it possible to get a return of the output of the collieries for this year? I understand they are made weekly.

Chairman: Yes, we shall have that.

SIR LEO CHIOZZA MONEY, Recalled.

12,748. *Mr. Arthur Balfour (to the Witness)*: Have you had any practical experience of the working of coal mines yourself?—No, I have never been a mine manager or been employed in the management of a mine.

12,749. Have you ever visited a coal mine?—Yes.

12,750. Frequently?—Yes, I have seen the outer workings of a large number of mines, but I have only actually been down one mine.

2 May, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

12,751. So that you have not really any experience of the working conditions of a colliery?—No. I can only say I have endeavoured to understand coal mining, so far as that can be understood without being engaged in the operations.

12,752. As regards the housing of miners, have you much experience of the housing of miners; have you seen many miners' houses?—Yes, I have been in miners' houses. I have seen some fairly good and I have seen some very bad. I have never seen any very good, but that may have been my misfortune.

12,753. How long is it since you were in a miner's house? I should think a year or two before the war.

12,754. You have not seen the modern houses which have been built in the last six years?—No. The last six years include four years of the war, during which, I understand, there has been no building.

12,755. Are you aware there has been building of some very modern houses?—No doubt that is so, but from all the evidence I have been able to gather, without inspecting all the mining districts minutely, I understand those very good houses are unfortunately a minority.

12,756. But still private ownership has provided a large number of very good houses?—Yes. I think it is only due to some private owners to say they have done so, just as in industry there are some few exceptional manufacturers who do put up excellent garden cities, but they are exceptional.

12,757. I take it you have quite made up your mind that the nationalisation of coal mines is the only thing to be done?—I think I ought to answer that by saying that for fully 20 years I have endeavoured to study this subject. I have endeavoured to be a student of Jevons and other coal authorities. I have collected a very large amount of evidence on the subject during those 20 years, and it is true that I have come to the conclusion that nationalisation is advisable.

12,758. So that you attach really very little importance to the evidence which may come before this Commission?—Not at all. But I am bound to say I have had in my possession for years more information on the subject than has yet been given to this Commission.

12,759. Is there not a very grave risk to the coal trade of this country in an embarkation on an experiment of such magnitude?—No, I do not entertain that opinion, or I should not be in favour of nationalisation.

12,760. Is that not so, when you have no precedent to turn to to warrant it?—No. I am afraid it is a question where one can only go on one's knowledge of the nature of the industry, and of the fact that the coal belongs to this country and certainly cannot under any conditions be got rid of by a new system: it must be worked. I do not see any reason why it should not be worked adequately and economically. I also think it will be worked more economically under public ownership for the reasons I have given.

12,761. Do you accept Mr. Webb's suggestion of restricting the number of people coming into the mine with a view to balancing the output in good and bad years?—I think myself that that is not a practical question, because from the figures which have been supplied to this Commission—which indeed we knew without their being supplied to this Commission—the coal output of this country has shown an almost continuous steady increase, and even when there come what are called trade slumps, they make very little difference in the output of coal. If you like I will give you the figures, but probably you have them.

12,762. Yes, we have them, but that does not answer my question. Do you accept Mr. Sidney Webb's proposal that you could balance the output of coal from the mines in good years as against bad years by restricting the number of people going into the mines so as to run them continuously?—You say "restricting the number of people going into the mines."

Mr. Sidney Webb: I said "recruits."

Witness: I did not understand that that proposal was made.

12,763. *Mr. Arthur Balfour:* Yes; Mr. Webb said recruits?—I see what you mean, and I beg your

pardon. In the years where trade slumps occur in connection with trade cycles, Mr. Webb's suggestion was that in those years the State would stop off the supply of new recruits. I think that is a very sensible proposal and one which is more easily carried out under nationalisation than private ownership.

12,764. But you admit it would restrict the output?—No, because you would obviously put out in those years the maximum possible, and therefore there would be no advantage, would there, in getting new recruits to put out more than that?

12,765. But the moment the demand came, the fact that you restricted the recruits going into the mine would mean that you would not have the amount of skilled labour you required to proceed with?—The figures do not show in practice that there are any violent jumps in output. So far as I can tell from the figures, it is really a steady increase, and I cannot see therefore that there is any practical difficulty. If you take the figures from 1880, from 1890 and from 1900, in every case there you get a steady increase of output.

Mr. Sidney Webb: Sir, would you allow me to interpolate? I am sure Mr. Balfour does not want to misrepresent me. Nothing I said bears any likeness whatsoever to what is called restriction of output, and I am totally opposed to any such policy.

Mr. Arthur Balfour: I quite accept what Mr. Sidney Webb says, but I want to put to Sir Leo that his method of doing it does in fact restrict output.

Witness: As a matter of fact I cannot see that any such result would obtain. It is exactly the same case as the Post Office, which, in a progressive country like this, is always needing increased services from year to year, and it has no difficulty in providing for that. I cannot see any greater difficulty in the case of coal.

12,766. You would not for a moment pretend that the question of delivering letters is a skilled work like working in a coal mine?—But this is a question of the number of people. The number of people required has no reference to the skill required.

12,767. But you cannot train people from day to day to work in a coal mine. You know perfectly well, do you not, that they have to spend two years before they can go down the pit?

Mr. Sidney Webb: No, no.

Witness: As a matter of fact, as I have pointed out, the figures show this is no practical difficulty at all under any system. It seems to me that the questions are based upon the supposition that there are violent fluctuations in the output of coal. Those violent fluctuations do not occur.

12,768. *Mr. Arthur Balfour:* Then as a matter of fact all the arrangements Mr. Sidney Webb suggests of stocking are not necessary?—They are necessary up to a point, but they are not of the importance suggested in your question with regard to Mr. Webb, if I may say so.

12,769. In other words, there is no fluctuation of working in the mines?—Yes, there is fluctuation, but not violent fluctuation.

12,770. Then the provision Mr. Webb suggests is not necessary?—No; it is an excellent provision for the minor variations that occur.

12,771. With regard to State management in Germany, do the employes of the State there work longer hours than our men?—I do not know.

12,772. Do you know whether they are better paid than our men?—I do not know that, but some papers have been put before this Commission which indicate (I admit the language is somewhat obscure) that the State servants do have advantages which are not possessed by the private servants. That is indicated in one of the papers.

12,773. Their hours are longer and their pay is less?—If you will be good enough to give me the reference, I shall be pleased to study it. If I may add, if you will forgive me, it is not the case throughout the world in State industry or the rule, but it is the reverse, for State servants to be paid worse than private servants. Take our Colonies, take Australia and New Zealand.

12,774. Wages are higher in Australia and New Zealand than in this country all the way round?—

2 May, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

Yes, but the point is—are the State servants worse paid than private servants? There is no evidence to show that in any democratic countries, and after all this is a democratic country.

12,775. If the State owned the whole of the coal mines, as you contemplate, what would happen immediately in the case of a strike?—I should say that in the first place a strike is much less likely to occur under some such scheme as I have indicated in my *précis*, because the men are represented, first of all, on the Central Council with executive powers; secondly, they are represented on the District Council with executive powers; and, thirdly, they are represented on the Pit Committee with consultative powers. Therefore a strike would be less likely to occur. If it occurred, you would have at your hand such machinery for settling differences as does not now obtain. You cannot wholly prevent the possibility of strikes, but you could, I suggest, under such a scheme, as has been suggested, deal with them much more easily and much more readily and with a much greater probability of rapid success than you could under the present condition of unco-ordinated management.

12,776. I suggest to you, you would be immediately in conflict with the State and would be much more likely to need martial law than at the present time when you have the buffer of private enterprise and the Government coming in as a third party to intervene?—I think you are entitled to your opinion, but I think the evidence as to State undertakings throughout the world shows on the whole that there are fewer strikes in connection with State and municipal enterprises than there are in connection with private enterprise. I do not say they are wholly free from them. May I explain my answer?

12,777. Yes.—It is to be remembered that what we are now proposing is not even such a system of management of railways as exists in Australia, but it is something more than that—something where the men are really associated with the industry in the sense of social responsibility. I count upon that, and I think I am not wrong in counting upon that.

12,778. It is simply a feeling of yours that that would happen?—Human nature has been mentioned a great deal in the course of this discussion. I have the right to my opinion about human nature as well as any other man, and my opinion is—I have seen it verified in practice again and again—that if you give responsibility to a man, in whatever class of society he is, he usually rises to it. That is my view.

12,779. That was not the result with regard to railways when they had big strikes in Victoria.—I grant that the case of Victoria is a point in your favour, but against that I remind you that the railways of Victoria were not managed under such a system as I suggest here (I am only entitled to speak for myself) for the management of the coal mines; that is to say, there was not in the case of the Victorian railways in that sense the managerial responsibility which would exist, I suggest, if this scheme were carried out.

12,780. Are you aware that the Berlin States Coal Office which dealt with the sale of two and a half million tons of coal spent an enormous amount of money in doing so and increased the price of coal to the amount of two marks alone?—No, but I will take it from you if that is so.

12,781. There is evidence in the Reconstruction Review of the second April at page 255 which I should like to call your attention to. Would you consider M. Lenin as any authority of any account on nationalisation of an industry?—I know very little about him or his opinions so that I am afraid I cannot answer as to that.

12,782. Are you aware that he in a brochure recently issued has admitted that the attempt to substitute State for private management throughout the industries of Russia has been a failure and he now advocates private management?—No, I do not know that; I have missed that somehow.

12,783. You will find that on page 288, April 16th, of the Reconstruction Supplement?—I am afraid I am not an authority on Lenin.

12,784. I want to take you for a moment to the quantity of coal required for the production of a

ton of steel. The evidence to which you refer is that of Mr. Talbot in the Coal Conservation Committee Report referring to ideal conditions, at page 83?—Yes. They undoubtedly refer to conditions which I am afraid do not obtain in a large majority of the steel works of the United Kingdom, but which I think might obtain.

12,785. Where would you erect a plant in this country to obtain these ideal conditions?—I have here a letter from Professor Watkinson, whose evidence on the subject I put in before, and perhaps the Commission might like to call him. He says that the Skinningrove Iron Co. has adopted the system. He says also that he is informed it has been adopted by the Partington Steel and Iron Co., Ltd.; that, of course, is the process, as you know, where the whole of the operation is conducted in one works, so that you do not, as it were, make pig-iron and foolishly put it to cool and start over again and make your steel out of the pig-iron, but you make it straight away. As I understand from Professor Watkinson, that has been done, and is being done, by firms in the United Kingdom at the moment, so that it is not merely based upon supposition. It is not "ideal" in the sense that sometimes the term is abused—theoretical and not practical.

12,786. But, at the same time, you are not controverting the evidence given by Mr. Wallace Thornycroft of the actual figures which were examined by Sir William Peat as to the fact that that amount of coal was used for a ton of steel and that steel might be and was of a special kind?—So far from controverting that evidence, I think it is most valuable evidence showing the extraordinary waste of fuel that now goes on.

12,787. Is it a waste of fuel if it is a special kind of steel which has to have many other processes spent upon it other than the mere making of ingots?—I am afraid it is true there is a considerable number of plants which might be improved to secure better results.

12,788. Perhaps we shall have evidence on that?—Yes. As you know, I am not an iron and steel authority, but I am merely a humble student of the subject.

12,789. Now I should like to take you to the question of the Government dealing with the exportation of coal. Would it not be a very delicate matter for the Government of this country to negotiate in peace time coal supply for other countries?—If that were thought to be true, then, of course, as I think, as has been pointed out by Mr. Webb, one need not disturb the present system; I mean the question of nationalisation is not involved in this. You could produce your coal, and, as we say, economically. You could put it at the disposal of your export merchants and let them carry on their trade, even as they do now. That is one plan, and would avoid the risks of the kind you speak of, if you thought we were foolish to run them. On the other hand, you could form export agencies which would have a sort of independent existence from the Government and which could carry on the trade. Or, again, you could have your State export department which, as I think, would fit in with what I conceive to be the future development of the world in which the export surpluses of the different countries will, I think, undoubtedly, if I may venture to prophesy about it, be exchanged by Governments instead of being trafficked in by merchants.

12,790. Do you appreciate that that means control of selling prices?—Take the first course. It would mean that the State producing its coal as economically as possible would place that coal at the disposal of the export departments at the lowest possible price. If that is so and if it is true that nationalisation would give economy—only if it is true—then the export trade would benefit. If, as you contend, nationalisation would raise the price of coal the export trade would suffer and that, of course, is the difference between us.

12,791. I think the point is not that. If this country supplied coal to Italy for the Italian Government, surely there would have to be some kind of control on the selling price of that coal in Italy after it has passed to the Italian distributor or would

2 May, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

the Italian Government become the distributor?—That would be a matter for the foreign Government.

12,792. But you can see that might cause considerable conflict as regards our minors because of the profit that was being made by middlemen in Italy.—There are possibilities in that direction, but certainly not greater possibilities than now exist, and I think that with the increasing correspondence and co-operation that is very happily springing up between nations, those difficulties would be avoided and more and more avoided under nationalisation than private ownership. But, here again, we are uttering matters of opinion.

12,793. Have you had any experience of negotiating with foreign Governments for their requirements?—My experience has only gone so far as considering administratively the possibilities of pooling the products of the world. It is a pretty big proposition, but we have had to face and consider it. At the Ministry of Shipping we had to pool ships.

12,794. Under war conditions.—Yes, truly, but making it more difficult and not less difficult. I think if people understood the difficulty of the things actually accomplished in this war they would not talk about the difficulties of nationalisation.

12,795. I see you agree that royalty owners should be compensated.—Yes, but I am bound to say that I have not easily arrived at that opinion, and I am bound to admit the very strong arguments that exist against it. The deciding argument to my mind has been, rightly or wrongly, that I want everybody to have confidence in the State. I want everyone to have confidence in democracy. Therefore, if I commit an error, I like that error to be on the part of generosity rather than the other way.

12,796. In other words, you realise that unless there is confidence in the rights of property, whatever it may be, you will undermine the whole confidence in the State and make it difficult for other people to trade with such a State?—I am not sure I can go quite so far as those expressions, but I should like to point out to you that Parliament has already in a practical way expressed the opinion that there is a very great difference between property in royalties and other kinds of property. It has actually confiscated part of them already by special duty, which really means it has confiscated part of the royalty, and I think it is for royalty owners to consider whether in the future that process is not likely to go on.

12,797. You refer to varying degrees of competence in private concerns. Surely that exists in Government services too?—I fully agree, and it must exist in every state of society.

12,798. Possibly more so in Government service.—I am afraid I cannot admit that, but I do admit there are variations in confidence.

12,799. Have you any experience as to whether, for instance, battleships have been built cheaper at our dockyards than they were purchased for from private contractors?—I am afraid I have not the figures. I should be interested to get them. I do not know whether you have them.

12,800. I have not them in my head.—I do remember hearing that we made rifles at Enfield more cheaply than they were made by any private contractors.

Mr. Evan Williams: Was there not a public enquiry into the comparative cost of battleships?

Mr. Arthur Balfour: Yes, I think there was.

Chairman: Yes, we will get that.

The Witness: I do hope you will not interpret my answer as consenting to the proposition that the management of our dockyards by the Admiralty in the past has been a proper system of public ownership or democratic management. I think it has been very far from that.

12,801. *Mr. Arthur Balfour:* On the other hand, it has been a Government managed concern.—But when you say a Government managed concern, you mean a thing with infinite degrees of variation.

Mr. Arthur Balfour: Quite.

12,802. *Mr. R. W. Cooper:* I am not going to trouble you much with ancient history, but you refer here to the north country limitation of the Vend?—Yes.

12,803. That ceased to exist a good many years ago?—Yes; I hope I indicated that the day before yesterday.

12,804. In 1850, I think?—Yes.

12,805. It began about 1771?—That is right. It lasted three-quarters of a century.

12,806. But of course the condition of society then was very different to what it is now?—But if we refer to our old friend human nature again, the suggestion has been made that human nature does not change. In so far as your question has a good basis, it seems to show it does change, and even private ownership is very much better than it was.

12,807. I am not suggesting that regulations of Vend are desirable things?—I am sure of that.

12,808. Now one or two questions on your remark about the ownership of minerals. Of course, as you know, the ownership of minerals in the United States is practically the same as it is in this country?—Yes. I believe that to be broadly true.

12,809. That is to say, that the owner of the surface in America has the mineral rights?—Yes.

12,810. You have read no doubt some of the exhaustive reviews of that particular point in the report of the Mining Royalties Commission of 1893?—Yes.

12,811. Where they state in effect at paragraphs 244 and 245 of the Report on page 51, that: Apparently the policy of all legislation in America, both Federal and State legislation, has been to encourage private ownership of minerals?—Yes, I am afraid that is so.

12,812. It is a fact nevertheless?—Yes. It is not fair to ask you to let me explain that answer, but I should like to do so.

12,813. Knowing your views, I can quite imagine that you would be disposed to criticise the American policy?—If I may utter a single sentence on that, it is this: That the late President Roosevelt set up an American Conservation Commission charged with a survey of the resources of the United States. What did they find? Their report teems with facts relating to the waste of coal and to the waste of oil and to the waste of timber by private interests in the United States.

12,814. How long ago was that?—That was just before the war.

12,815. I see at the beginning of your proof you refer to probably the same American Committee. I should like to know the date of the report and what became of it?—I am afraid I have not the date of the Commission, but I have the reports at home.

12,816. Perhaps you would tell me privately afterwards?—Yes.

12,817. I should very much like to know for my own information?—I am afraid you will find it to be true that some of the extraordinary instances of waste that they bring forward in their reports are almost incredible. They point out the exhaustion of American coal at a date which, although it is a later date than ours, is very near. They point out that timber has disappeared and that virgin fertility has disappeared. To my mind, from the world point of view, it has been a waste of the world's resources which it takes very strong language to describe properly.

12,818. I suppose the probability is that in America there may be two opinions upon that particular point?—Well, I think it has been worse than here.

12,819. Then you mention France. There again, if you look at paragraph 293 of the Mining Royalties Commission report, you will see what they tell us about the French law, which appears to be very peculiar indeed. Apparently in France the State is not the owner of the minerals, nor is the surface owner. The State must grant the concession, but the State cannot work the minerals. That appears to be the gist of it?—Yes, it is a curious position.

12,820. It is an extraordinary position, I agree, but there it is. I mention that because you refer to a witty Frenchman's remark about the ownership of minerals?—Yes. That same Frenchman has some very interesting things to state about it in his book.

12,821. Do you know whether anything has been done in America in consequence of the report upon the conservation of coal in America?—No. I rather

2 May, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

gather the war interrupted its proceedings, and I have not any quite recent record.

12,822. Now on the second page of your proof you tell a good deal about what the Coal Supply Commission of 1903-5 said. Practically speaking, were not all those conclusions, or rather the statements that were made by that particular Commission, under review by the Coal Conservation Committee which practically may be regarded as the next Commission sitting on the subject?—Yes.

12,823. And they made a series of suggestions or recommendations dealing with those points?—Yes.

12,824. Without troubling you with the details of the Coal Conservation Report, would you agree with me that the general effect of the last report of 1918 is to show that considerable progress has been made since 1905?—Yes; I do not think it would be unfair to use the word "considerable."

12,825. There has been, I think, in one respect, at any rate, in one part of England, a most remarkable degree of progress in the use of electrical power about mines?—Yes.

12,826. I am referring, as you know, to the north-east coast?—Yes.

12,827. With regard to another matter referred to the Coal Supply Commission of 1905, which I do not think was dealt with by the Conservation Committee of 1918, and which is referred to in the 11th paragraph of your *précis*, about a prejudice that exists against by-product ovens. Do you not think, even at the time of the outbreak of the war, that by-product ovens had to a very large extent, since 1905, made progress and superseded the bee-hive ovens?—Yes, some progress had been made, but certainly—if I may express an opinion—to my mind, not sufficient.

12,828. I see your view. Do you not think that the progress of the adoption of by-product plants in lieu of the old bee-hive oven is a thing that naturally depended a good deal upon the demand for the by-products themselves?—Yes, that is true. I think the colliery proprietor has a right to say to the chemical industry, "Why did you not make a greater demand upon me for by-products?"

12,829. After all, business is business; you could hardly expect colliery owners to put down a large amount of capital until they found there was a large demand for the by-products?—Yes, but, if I might respectfully say so, I think there was a good deal of prejudice on the part of the colliery proprietors themselves. The bee-hive oven lived on long after it was obsolete.

12,830. Do you not think there was a large amount of prejudice on the part of the user of the coke blast-furnace owner?—I am afraid I am only expressing an opinion which has been already expressed by Mr. Webb when he said, I think, that there was a certain backwardness in the application of science to industry in this country.

12,831. I think, as a matter of fact, there was, at any rate at the outset, a good deal of prejudice on the part of the user of coke to by-product coke compared to bee-hive coke, and that was considerably due to the appearance of the coke itself?—I am afraid so.

12,832. But you say that has been largely overcome?—Yes. I remember writing about it 12 years ago.

12,833. On the question of prejudice, that, of course, is no new thing; that has been a feature of the history of all industry?—Yes.

12,834. Now I want to ask you about a subject, touched upon in paragraph 14 of your proof, on the question of the exploitation of our previously unwon coalfields. There has been, has there not, in the last 15 years, or thereabouts, a very large development of coalfields which 30 or 40 years ago were practically never noticed at all—for example, in South Yorkshire?—Yes, I think that is a perfectly true statement.

12,835. And of course as we all know there has been a certain amount of enterprise exhibited in Kent?—Yes.

12,836. And all that has been done by private enterprise?—Yes, but if I may say so, this valuable opinion which I quote from Professor Watts is an opinion formed by a competent geologist who has

knowledge of all these things and who yet thinks that it is necessary, as I understand him, to have a national exploration in view of what Jevons called the "almost religious importance" of the subject.

12,837. Yes, I quite appreciate what you say—in other words that the work of geological discovery could be carried on more energetically by the State than it has been hitherto?—Yes. And I cannot help feeling that if we had such a Ministry of Mines as I have endeavoured to sketch out, and especially, as I would like to add again if I may, if that Ministry of Mines were expanded into what I think it ought to be, namely, a Ministry of Power governing not only mines, but the use of coal in industry through electricity and so forth, and all other forms of development—if you had that, the energy of that Ministry could not fail to be concentrated upon our coal resources, and we should get results far superior to any that we have yet obtained. There has been nothing, as it were, to direct the energies of the nation to this all-important subject on which the population and the wealth of the country almost entirely depend. As I conceive it, such a Ministry as this, even if it were confined to mines, but still more if it were not confined to mines and made a Ministry of Power to deal with this subject adequately, if it failed in its duty would be called to account; now there is no one to call to account.

12,838. Of course, there is now the Geological Survey Department, is there not?—Yes.

12,839. I suppose you would be disposed to agree with me that the assistance which has been given by the State from that Department hitherto has been of a very slender description?—Yes, just as it is with other matters in which we should bestir ourselves. It was the same with State cotton growing and every other thing we ought to have done. The State was supposed not to act, or, if it did, it did so grudgingly.

12,840. And particularly when it involved expenditure of any money?—Yes, but that is because it was the theory of the Government that it was its duty not to govern. We want to change that idea.

12,841. I can see your point of view. On the question of export trade, of course, as we all know, and you know better than many of us, there has been an enormous expansion of the British export trade in coal?—Yes.

12,842. I intended to ask you this before. Of course, there has been equally remarkable expansion in the output of British collieries, say, in the last 40 years?—Yes.

12,843. As regards the use of coal for shipment, it is a fact, is it not, that already the British Admiralty are showing that in future they are going to rely more on oil than on coal?—Yes. It is a very menacing fact.

12,844. Of course, the more oil they use the less coal they will use, and, therefore, the more coal will be preserved?—Yes, except that, as I point out in this *précis* of mine, if science makes it (some say it has already made it) more advisable to use oil fuel for ships than coal for ships, that will extend far beyond warships—it will extend to all ships. That will mean the extinction of a large part of our export trade, and it will have great economic consequences for this country. That is why I say it is a menacing fact.

12,845. I do not see why, because it is likely that oil will be used for the purpose of propelling ships rather than coal, that that should affect our export trade, except to the extent of reducing the amount of bunkering coal exported?—It will to a very large extent. I am speaking of the growth of the export trade as we know it. I think it is a fact, although I could not quote exact figures to you, that the growth of that trade has largely been one with the growth of the world's steamships—that is to say, we send out this coal very largely to be picked up by steamships—curiously those steamships being chiefly our own.

12,846. You are entitled to say that to a certain extent; but there has also been a remarkable expansion in the exportation of coal for buyers abroad?—Yes, and it would not touch that part, I grant.

12,847. You have referred, from your point of view quite naturally, to the remarkable stimulus the war

2 May, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

undoubtedly gave to certain branches of industry; but after all that was a war stimulus?—I fully grant it.

12,848. Having regard to the position in which this country stood, and which I need not enlarge upon, I should think that it would be an exceedingly dull man who did not feel at one time or another that we were in imminent peril?—We were in very imminent peril—much more than most people realised.

12,849. And a great deal of this stimulus may be put down to the natural instinct of self-preservation?—I think that is undoubted. May I say something on that?

12,850. Yes, certainly.—This also happened, that the people who understood, who were inside, who were part of the national organisation, did their best, whereas the people who were just outside, and who were not so well acquainted with the facts, did not always do their best. That is a curious fact.

12,851. Do you mean the people who did not come in and help the Government?—Yes. Very often the business man inside the Government was being thwarted by the business man outside the Government: No. 2 would not be so good a specimen as No. 1. Why was that? Because the man inside knew the national point of view. The man outside could only see his trade interests. That is one of my arguments for nationalisation.

12,852. I see in your *précis* you refer to potash. I believe you are referring there to a process by which by the application of salts to the blast furnace gases potash can be extracted?—Yes.

12,853. I believe that is in the hands of English patentees, is it not?—I am afraid there you know more about it than I do. I am afraid I must take that from you.

12,854. I know a little about it, having had the papers through my hands. Supposing the mines were nationalised, do you think that the State would pay the same scale of salary to persons, whom it certainly could not dispense with at first, as private enterprise is now paying them?—I think it should do so.

12,855. I agree; but do you not think that there is a probability that the Treasury, which has not the reputation of being the most liberal paymaster, might cut these people down to the prejudice of the community?—I frankly admit that I have no greater regard for the Treasury in that respect than you have. It ought to be denounced, in my mind, and I take this opportunity of denouncing it.

12,856. I notice that towards the end of your proof on page 5 you are quite clear that as the responsibility for the control, direction and management of the mine is imposed by Statute on the Manager, he must have complete power?—This is a point on which I have personally had the very greatest difficulty in arriving at a decision. I confess it. What I have had regard to is that the very deadly character of the employment of necessity, as it seems to me, imposes a personal responsibility on someone, and then the endeavour which I also desire to make to associate the men connected with the mine in some responsible way with its direction, but I admit that that is a difficult proposition, and what I have suggested here is the best thing I have been able to think of as a way out of those difficulties. When one is considering in this connection what element of actual responsibility you would give the miner I cannot but think he would be impressed by first his representation on the Central Body, secondly his representation on the District Body, and thirdly his representation on the mine itself. If I were talking to him personally, I should say to him, "Have regard to each of these three things and ask whether on the whole they do not give you some proper share in the work that you do." That is all. I want to hammer that out, and I think it is a very proper office for this Commission to hammer that out. I am not dogmatic about it. I want to do the best I can.

12,857. As we all do who recognise the absolute necessity of maintaining discipline in handling a coal mine?—Exactly. It is like handling a ship.

12,858. *Mr. Evan Williams*: You said a few minutes ago that the old theory of government in this country was not to govern?—Yes.

12,859. In your opinion is a change from that position an easy one to realise?—I think it has been very

rapidly coming about during the last 15 years, and I think the war has given an impetus to the movement which it will never reverse. We shall go forward.

12,860. You agree that before the State took over the control of the biggest industry in the country that ought to disappear altogether?—You cannot swim without going into the water.

12,861. I do not think the analogy is quite apt. You do not dive into deep water straight away when you learn to swim?—You mean that the size of the coal industry renders it too great an experiment?

12,862. That is my point?—I should say that the nature of the coal industry makes it one of the most secure for making experiments.

12,863. Do you mean in the way of profit to the State?—No. Let me take the case of the cotton industry. The cotton industry depends on foreign markets. There is no guarantee of a single order being obtained outside this country; but if you are dealing with the coal industry you are dealing with a natural resource which even the worst management cannot make a failure of. That is the curious thing. The stuff is there.

12,864. You are speaking of the commercial aspect of it?—I am trying to show why I do not think it is as great an experiment as going into a smaller industry.

12,865. The production of coal, I think you will agree with me, is by far the more difficult and more important part of the industry. Do you think it is wise for a State that has been existing on a theory that it is not its duty to govern to take a header into such a depth as this without first of all experimenting by going first up to its ankles and then up to its knees?—As compared with what we have done in a great hurry in the last three years, it is really a small thing. I do not think people realise the extraordinary activities which have been State-controlled during the last three years, and the success with which it has been done. I know many people joke and laugh at it, because they do not know what has been done in the way of economy of production.

12,866. Do you think an industry of this kind could be conducted in peace times on the same principles as in war time?—Only in some cases where you take direct production, as for instance in the manufacture of projectiles and in the case of the Gretna Works, where it has undoubtedly been done under conditions of the greatest economy, and at the same time the welfare of the workers was looked after.

12,867. That is only a small process?—I do not think it was an easy thing to introduce the standardisation of shells and fuses in this country. It meant teaching people how to standardise who had never standardised before. It meant setting up a system of gauge making which had never been thought of before in this country, and all this was successfully done under conditions of the greatest haste in a few years.

12,868. Do you think standardisation is applicable to a trade like the coal industry?—No, it is not, because the coalfields vary so in their character, and have to be tackled by different methods; but some things can be standardised, as, for instance, winding engines—they can be brought up to a level of efficiency which it seems to me would certainly rise, because you would get the best brains in the mining industry managing it, whereas you get now the best brains managing only a part.

12,869. Is not all progress in industry, and everything else, due to a few advanced persons?—I thoroughly agree with you.

12,870. Where you have competition does it not necessarily follow that others must necessarily keep as close as they can to their competitors, otherwise they would be left hopelessly behind?—I am afraid it does not work like that in practice.

12,871. Is that not the history of all progress?—The history of every industry is this: that there are the widest variations in practice and efficiency.

12,872. Still, it is the private individual who is full of enterprise, and who is possessed of brains which does lead to bringing about improvement?—That is true.

2 May, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

12,873. In the coal industry you have a few people who are far ahead of everybody else?—May I put it to you that the Minister of Mines, who knows his business—and if you cannot find men who can manage an industry of this kind then you had better give up any system, whatever it is—but assuming you could get an intelligent Minister of Mines, would he not do what the Minister of Munitions did? He would get hold of the best man, and he would say, for instance, if it was in a Yorkshire district: “Will you manage the Yorkshire district—will you be the managing director?” In that case that man would use his brains for the whole of Yorkshire, whereas before he only used his brains for one mine.

12,874. Is that your experience of Government management?—That is what occurred during the war. Before that there was not much to go upon.

12,875. That is just my point. We have no peacetime experience to go upon?—It happened in other countries where larger experiments were made.

12,876. What would you consider as the true test of efficiency?—Do you mean in an industry?

12,877. Yes, in an industry?—Economy of its production.

12,878. As regards output?—Yes, certainly.

12,879. As regards cost of production?—Yes.

12,880. And as regards the margin of the selling price over the cost of production?—Certainly not.

12,881. You do not regard the commercial part as coming in?—I think that is a great misfortune. If a private firm uses economies which are the product of the brains of clever men to reduce its costs, and then avails itself of that reduction to make a large profit out of the public at large, that is not a good thing for the country. The economy was a good thing, but the man used that economy not to benefit the public, but to benefit himself.

12,882. So that your view is that the cost of production should be as low as possible?—Yes. The cost of production should be as low as possible consistent with the welfare of everyone engaged in the industry, and the Government should get the profit. In whatever organisation you have you must have provision for capital and depreciation, but only such a margin as is necessary for economical purposes.

12,883. Then you eliminate the profit as one of the factors in conducting the business?—Yes—commercial profit.

12,884. Would you eliminate it from all the persons engaged in the industry?—Yes, that follows.

12,885. Then you would eliminate it from owners, managers and workers?—Under that system there would be no owners—they would be you and I.

12,886. Then you would eliminate it from the workmen?—Commercial profits, certainly.

12,887. Does that mean that you would abolish piecework?—I should hope so in the long run.

12,888. Completely?—I hope so. I hope there will be no piecework in another 20 years.

12,889. You would pay a man a fixed wage, and trust to him to get the best output?—Certainly, and in the long run we shall get it. I do not propose to abolish piecework to-morrow, but if I were a Minister of Mines I should impose such education and such household conditions as in the next generation would give you the best work without piecework.

12,890. In the meantime you would continue it?—Yes, I think so.

12,891. That is the old question of human nature again?—Human nature is a various thing—Dr. Jekyll and Mr. Hyde, you know.

12,892. You have dealt in the first part of your paper with the nationalisation of the coal itself?—Yes.

12,893. The mineral?—Yes

12,894. You regard that as something quite different and separate from the nationalisation of the industry?—It could be so regarded, but I do not so regard it

12,895. Do you not think there is a very marked difference between the two?—Of course, there is an obvious line of demarcation. It is a different kind of property, and so forth. It is quite possible, of course, to nationalise minerals without nationalising the working of the coal.

12,896. At any rate, you do advocate the nationalisation of minerals?—Yes.

12,897. That is something that we have experience of in other countries?—Yes.

12,898. Have you any knowledge what other countries have obtained from that in the way of removing the obstacles that you claim private ownership has put in the way of the industry?—No. There are so many complications in the mineral laws of other countries that it is very difficult to draw any deduction from them.

12,899. So that we have no experience to guide us?—No. It seems to me a question of ordinary justice which anyone is competent to form an opinion on without referring to any other country whatsoever.

12,900. With regard to the conservation of coal, I think we are all agreed that it is a very important matter, and the economy of its use. You enumerate certain recommendations which the last Coal Commission made, (a), (b), (c), (d), and (e). With regard to (a), coal left in barriers, and that kind of thing, have you any data at all from other countries, where the coal is nationalised, as to whether the barriers are left?—No, I am sorry to say I have not.

12,901. You say now that large area leases were tending to diminish it?—That was the verdict of the last Coal Commission. I am quite ready to accept it because it seems to me common sense that there must have been some improvement as time went on in that matter, because the evil is so glaring.

12,902. There is considerable improvement?—I imagine so.

12,903. That is under private management?—It seems to me to be unnecessarily slow.

12,904. Does it not seem to you that all pits must get bigger?—I was told this morning of a case that I could not have believed if I had not heard the facts.

12,905. Might we have it?—I am here to speak of things I know, and this is a thing that I was told. What the soldier said is not evidence.

12,906. If we confine ourselves to the things we actually know it would save a lot of trouble to this Commission?—It was just a story that was told to me, and it was to the effect that a certain lease contained a provision that a park of 400 acres was cut out of the lease for coal-working purposes. There was no coal got under that, yet it had to pay a dead rent for the whole period of the lease, and was not to be touched. There are particulars of that kind in the lease that seem to me to be incredible.

12,907. That was the case of a wicked landlord, I suppose. A good deal has been made of the leaving of small coal in the mines. Do you think under State management it would be proper to take all the small coal out?—No; that would have to be decided by the Central Authority, not only in relation to the economical value of the coal at the time, but also in relation to the duration of the coal source. They would have to balance the facts and say how much of this ought to be wasted finally and how much ought to be got out at whatever cost. As I say, they would have to balance the facts. I think it is true to say that there is waste going on that ought not to go on.

12,908. Do you know that in South Wales there are mountains of small coal on the bank which there has been no demand for?—Are there not all kinds of manufacturing uses for it—artificial fuel and so on? Are not all those things to be taken into consideration in that direction?

Mr. Frank Hodges: I should like to know the exact locale of those mountains of small coal.

Mr. Evan Williams: In the anthracite coal you have probably a million tons.

Mr. Frank Hodges: Is it small coal or duff?

12,909. *Mr. Evan Williams:* It is either small coal or duff. It is one or the other. They are both coal. At any rate, you would agree that there is no demand for coal of that kind, and it has to be thrown out on the bank where it deteriorates rapidly. It is more economical to leave it underground than to bring it up?—It depends entirely on what you do with it.

2 May, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

12,910. If there is nothing to be done with it but put it on the land?—I could not accept that without having more knowledge of the matter than I am competent to give you.

12,911. You do not suggest that these commercial men who are out to get as much profit as they can get will throw it on the bank?—Forgive me, that has occurred in industry after industry. Before the war we wasted every bit of tin that we put on iron to make tin plates of. The Germans made a commercial success of taking the tin off. That is a case of one country making use of a thing while another country is wasting it. I cannot accept the fact that nothing can be done with it, because I can give many instances to the contrary.

12,912. That is not wasting the tin plate itself?—It is waste to the nation. That is what I meant, that the Minister of Mines would regard these mountains of small coal as a very melancholy spectacle. He would set clever people to work to devise means for using it just as we did during the war.

12,913. The whole object of all those points that you enumerate here are to cheapen the cost of working coal?—And to save coal.

12,914. Is not the personal gain of the individual a very great incentive to doing that?—There may be two opinions about that conceivably, but as you know I have come to the other conclusion. I have come to the conclusion that a man never works so well as when he is working for the public. I may be wrong, but that is my view. It is my own case at any rate.

12,915. Do you regard your work as for the public?—The chief work that I have been doing for the last four years has been work for the State.

12,916. Would you recommend, for instance, the nationalisation of literary work and journalism?—Obviously it is a thing that cannot be nationalised, but as far as the Press is concerned something might be done. Of course, you can never nationalise organs of opinion.

12,917. Do you suggest that coal is not used to as great advantage in collieries as it is in other industries?—I should say that the colliery engines are fully as wasteful as the other engines throughout the country as a whole. They do waste a great deal of coal.

12,918. Are they not rapidly being brought up to a higher standard of economy?—I am afraid there is a great deal to do.

12,919. Under nationalisation you could do it in a day?—You can do it at a greater rate, and at a more economical rate, than with private enterprise.

12,920. Is that your opinion?—I am sure of it.

12,921. It is a matter of opinion after all?—I grant you that fully.

12,922. Do you suggest that in Government dockyards there is greater economy of coal than there is in private industrial concerns?—I have already said that I should be very sorry to put our coal mines under the type of management that existed in our Government dockyards.

12,923. Even the Admiralty?—Even the Admiralty. It has not been instinct with the principles we are advocating here.

12,924. Therefore there has to be a very radical change in the methods of the Government of this country before it can satisfactorily control the industry?—And that is the change that we are suggesting.

12,925. Do you suggest that the change should take place first in the Government?—As I have pointed out to you, we have shown the tremendous possibilities that have existed.

12,926. You know, as a matter of fact, that the dockyards have been most wasteful of coal?—I am not at all sure of that.

12,927. Do you know that they burnt large coal pretty well exclusively in pre-war days in dockyards?—I will take that from you.

12,928. Without using any small coal at all?—I should not be surprised to see the Admiralty polishing up the coal as they polish up the brass knobs, but we do not propose to put the coal mines under the

Admiralty. We must go on what we have done. The Ministry of Munitions, for example, did effect in time of war very considerable economies.

12,929. It had to?—I do not think it necessarily had to do many of the things that it did really. It went out of its way, for example, to study the social conditions of the workmen working for it. It need not have done that, but it did actually do it.

12,930. Then it is all to its credit. You have not only in your *précis*, but frequently in your cross-examination of other witnesses, claimed that the absence of by-product coke ovens and the absence of the by-products in this country under private management are a perfect scandal?—I am not sure that I used the word "scandal," but I indicated that it was very unfortunate for the country.

12,931. You suggest that if the coal mines had been under national control things would have been better?—I hope so.

12,932. Do you think that a Government that neglected to prepare for war in the way that ours did would be likely to devote itself to these by-products more than private owners would? Is the record of Government such as to lead you to that conclusion?—After all, if you take the case of the Admiralty, the development of the Royal Navy, although, no doubt, there were imperfections here and there, nevertheless I think it is true to say that if you regard the Royal Navy as an industry it was one of the most advanced industries in the country.

12,933. And yet the Government neglected to devise the means of finding ammunition for the Navy?—It was the lack of ammunition for the Army that hit us in the war. It was not the ammunition for the Navy.

12,934. Had we sufficient cordite for the Navy?—It was the enormous growth of the Army that made the shortage.

12,935. Before the war it was one of the things that the Government had to prepare for, and it neglected the necessities for war?—It was a matter of policy. We were perfectly conscious that we did not prepare for war in a land sense. We never intended to engage in great military adventures, and we took a pride in the fact that we were not a military nation.

12,936. After all, it does not say much for the foresight of Government management?—I only put it to you that as far as the main line of defence, the Navy, is concerned, it was an efficient industry, as the facts have proved. The Navy was efficient, and it did its job.

12,937. I was speaking of the Army, for which you say these explosives and other ingredients were necessary?—With regard to the Army, it was the policy of all parties not to have a big Army, but it would surely not have been the policy of a Minister of Mines not to produce coal.

12,938. You can never tell to what extent a policy may take you?—Surely you cannot imagine that it would be the policy of a Minister of Mines not to produce coal.

12,939. You contemplate that in the future under Government control there will be a big reduction in the consumption of coal in this country. I think you spoke of a figure of fifty-five million tons?—Yes.

12,940. You fear that our export of coal for bunkers, which I agree form a very large proportion of the coal which we send abroad as cargo, is going to be seriously reduced?—I fear it may be.

12,941. Then does it not follow that we must keep the cost down to the lowest point?—Yes, that is my point, that it could be done under nationalisation.

12,942. You think under nationalisation you would get cheaper coal?—That is not the way to put it. What I meant was that I did not want to say that I held out any promise that you could run down the price of coal under nationalisation. All that you can honestly say, and all that anybody can honestly say, is this, that nationalisation would give you the cheapest possible coal in the given circumstances. That is all. That is another matter.

12,943. That is your opinion?—Yes, that is my opinion.

12,944. Still you agree if all these economies are brought about, with the competition of oil we are

2 May, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

faced with a serious reduction in the export of coal and the consumption of coal in this country?—Against that, fortunately or unfortunately, is to be put this, that if you get a real good economy and make power cheap, then the cheapening of power would lead to the use of more power, and you get a reaction on the use of power that might increase again the need for coal.

12,945. You are trusting to an increase in the use of power and an increase in the output of every other industry in this country?—Yes, it seems to me clear that if under the scheme of the Coal Conservation Committee to be carried out by the Government, you made power more economical, not only cheaper but more easily used, that would expand the industry of the country so that less coal per economic unit would be wanted, but more economic units would be required.

12,946. Then you would have to get an outlet in foreign countries for the products of those industries?—Yes; I think the demands of the world will increase shortly.

12,947. You regard the prevention of accidents as a very important factor in this matter; do you contend that the number of accidents would be less under nationalisation of mines?—It is my opinion that they would.

12,948. Have you made any comparison between the statistics of fatal accidents in this country and in other countries where coal has been worked?—I have not just recently. I do not know quite what bearing it has on the matter.

12,949. There are other countries where the State works coal mines?—Yes. As you know, there is no real nationalisation of coal yet, although there is news that they are going to do it in Australia.

12,950. What is the difference in that point of view between the removal of the State incentive in a mine and the nationalisation of mines?—If you have a Minister of Mines responsible to Parliament for all accidents, whether small ones involving a few men or involving a number of men as a large disaster, the responsibility would be so brought home to the Executive Council of the coal industry in this country through Parliament that you would have a very different state of affairs. There would be a direct and more vivid responsibility than now obtains, although you know the State has done everything it could to impose personal responsibility on the people concerned.

12,951. You think that the spreading of the responsibility over the Committee would be a more important factor?—It is not a committee. It is hardly fair to call it that. It is an executive body.

12,952. I do not see that there is very much difference. Are you aware that the death-rate in this country is the lowest of any country in the world?—Yes, I believe that is true.

12,953. Half the death-rate in Germany and less than one-third the death-rate in America?—America has been improving lately, I am glad to see, but it is still bad.

12,954. And less than in any of our Colonies?—The Colonial mines are so small that they do not give figures of very great value for comparison. You cannot compare the figures of the Colonial coal mines with a country that is producing hundreds of million tons. The figures do not give a proper comparison.

12,955. Would you say that if it is a comparison per 1,000 men employed?—You do not get a proper average.

12,956. It is not one employer?—No, but still they are very small outputs.

12,957. Are you aware that Belgium is the only country where the death-rate before the war was less than this country?—Yes, I believe that is true.

12,958. There the mines are in private ownership?—Yes, and they are also very difficult and very fiery mines in Belgium.

12,959. Are they more so than in this country?—Many of them are.

12,960. So far as experience goes in that way, is it not all in favour of private ownership?—No. Taking the world at large, there are so few State-owned mines. After all, the proportion in Australia of the

State-owned mines is a very small proportion of the output. There is nothing to go on.

12,961. To whatever extent it has gone there is nothing to prove that a State mine is as safe as a privately-owned mine?—I should say there is no available material in that connection on which to found an opinion. If you cannot found your opinion on that you must found it on the common sense of the case.

12,962. Are not all the figures that we have sufficient?—The figures are not relevant. You have not nationalisation anywhere, but you have a small amount of State ownership in some places.

12,963. You have whole coalfields State owned in Germany?—The figures are not comparable.

12,964. The number of accidents in Germany is twice as great as the number per 1,000 in this country?—You want me to tell you what I know, and I do not know at this moment—I wish I did—what the ratio of accidents is between the German State mines and the German privately-owned mines. I really do not know.

12,965. I am afraid I do not; but still are there not sufficient State mines in Germany to bring down the average if there is an advantage on the side of the State owned mines?—One would want to know all the relevant facts before you can give an opinion on that, and there is not the material to form an opinion upon it.

12,966. Your view as to the control of mines differs very greatly from Mr. Straker's?—I do not think it differs greatly. The details are put down in elucidation of the principle.

12,967. You would not hand over the control of the industry practically to the Miners' Federation, would you?—I do not know that Mr. Straker proposed that. He proposed that on the Central Council the Miners' Federation should have half the number, and that is exactly the opinion I have expressed myself.

12,968. And that that Council should appoint half of the District Council and the Miners' Federation should appoint the other; that gives you practically three-fourths of the Miners' Federation and one-fourth something else. On the Pit Committees you have half appointed by the Miners' Federation, and half by the District Council. That gives you seven-eighths Miners' Federation and one-eighth something else?—That is very ingenious. It is not my opinion that the Miners' Federation in any proposal that they may put forward are dogmatic as to details. They want to hammer out those details on this Commission. I am sure they want to be fair. If they did not, I should not be here at this moment.

12,969. You would agree that it is of the highest importance to the industry to get everybody to pull together?—Yes.

12,970. That the workmen and the management should all have the same interest in the success of the industry?—Yes; but I may say that I do not see how two men can pull together when one holds the tools and the other does not.

12,971. If they are both interested in the result of the industry, does it not follow that they have a common interest?—Their interest is not common if one man is working on the property of the other. It can only become common when both those men have a common interest in the property. Then it is a common interest, but not without; that is my opinion.

12,972. If their welfare depends on the same thing—that is the success of the industry—does it not follow that they will pull together?—If a man feels that he is simply working on the domain of another with the tools of the other person, how can there be moral sanction for such a thing as that? You and I are talking on level terms; we should not be talking on level terms if I were in your employ.

12,973. This is what I am coming to. If it can be proved to you that such a result could be achieved without violently changing the industry, would you accept that as a better scheme than such a complete revolution as you suggest?—I could not for this reason that there must be moral sanction for industrial operations. If you do not get that moral sanction you never get the greatest economic results.

2 May, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

12,974. So that whatever evidence may be given before this Commission your opinion will be the same?—That is hardly fair, because if you prove to me that the one million miners will be happy, contented and satisfied working in mines belonging to other people I will change my opinion, but my knowledge of human nature leads me to believe that it will not be so.

12,975. If it had this result, that the men would share directly in the results of the industry in proportion to those results, and would bear none of the risks, would not that have a greater effect on their minds than the sentimental consideration which you have just put to us?—Profit sharing might produce in men a better incentive to work than the absence of profit sharing, but obviously if each mine in the country were worked by a group of miners who were working for profit then they would not pull together. Obviously there would be economic severance between them, and I do not think you would get the best results.

12,976. What proofs would you require to make you change your mind on this matter?—That is rather a difficult question for me to answer. Surely my answer to that is, Please produce your proofs. I cannot describe to you the kind of proof that you ought to produce to me.

12,977. No, but I think you can tell me what proofs you would require?—I should require it proved to me that under the conditions in which over a million men work in arduous occupation without any ownership of the means of production they could in the long run be contented. It seems to me a rather difficult thing to prove; but I am ready to consider any proofs that may be brought forward. I can only say that I as a man would never be contented under those conditions.

12,978. You say you would have to get metaphysical proofs rather than material proofs?—No; I should want proofs from the experience of mankind. Does not the experience of mankind show that there is discontent wherever that is? Look for a moment at Australia. The news is that there was a certain advance which was given to the men. The men proposed to set up a Commission. The owners then said "A fig for your Commission;" and the result is that they have been compelled to commandeer the mines.

12,979. Does not that sort of thing extend to Government concerns?—It may conceivably extend to forms of Government concerns which differ from the proposals put forward here in this, that they are managed upon the capitalist's idea of management from the top without consultation with the persons engaged, so that the persons engaged feel themselves cogs of the State. We do not want to make people cogs of the State. We want to make them self-respecting men working in an industry which they understand.

12,980. Then it really comes to this that the proofs that you require are such that cannot be produced?—It seems to me that proofs can be produced that there is discontent wherever this system is worked. It is for you to produce proof that any emendations of that system would produce content.

12,981. Then it comes to this that there is very little chance of anything being put before this Commission which will make you change your mind?—I do not know that. I still go on learning.

12,982. I am afraid I have made a very poor attempt?—Not at all.

12,983. *Sir Arthur Duckham*: May I ask you, do you come under the category of gentlemen described by Mr. Webb as "theorists"?—I hope so most earnestly.

12,984. You take most of your opinions from Blue Books and journals?—No, from men and things, including books.

12,985. But you do take a considerable amount from books and papers?—Surely every sensible man does.

12,986. More than from practical experience?—Certainly not.

12,987. You have had no practical experience of coal mines?—That I have explained.

12,988. So that any expression of opinion as to the conservation of coal is not from your experience?—That is to say that no Parliament in the world would be competent to discuss such a question as this, because it has had no practical experience in coal mines, which would be absurd.

12,989. You realise the great difficulty of reporting technical or involved discussions, firstly in condensing the reports, and you also realise that very often reports are not quite an accurate account of what they mean to portray?—Quite so.

12,990. You have had experience during the war I dare say of reports which do not quite show what is the actual fact?—I wonder if I can go so far as that. I am not sure that I can.

12,991. In matters that you actually know the truth of is the balance in favour of a correct report. In a condensed report of such matters would you be more likely to get a correct or an incorrect report?—I should have thought it was rather more in favour of an exposition of the facts on the whole, but I fully admit the difficulty.

12,992. I fully admit it, and sympathise with it; but I only make the point from the point of view of theory and practical experience. If you have practical experience you may say the report is wrong?—I cannot admit that there is any distinction between theory and practice, and the man who says there is does not know what he is talking about. Good theory is good practice.

12,993. Do you agree with Mr. Wehh's statement the day before yesterday when he said: "I hope that we shall show that a great deal of them, especially the men coming from private enterprise, have not been successful"?—I am here to say the truth as I know it, and I am bound to say that I differ from what Mr. Wehh said.

12,994. And his further statement: "Let me say that the University professors who have come in I think you would get your answer that the business man on the whole had not been such a success as the University professor"?—I think there have been great successes scored on both sides. I think it would be rather unfair of me from my own experience of both kind of men to dogmatise about it. I do know splendid instances of both cases, and I have the greatest respect for the men who have worked as they have in connection with these departments. During the war I have seen their work, and I respect their work.

12,995. Did you from your experience at the Ministry of Munitions know of any University professor who controlled a producing department?—They did not control, but they did advise. Mr. Lambourn did a good deal of work on the coke ovens.

12,996. I do not know that he was a professor?—He was from the Cardiff School of Mines. He was not a business man.

12,997. There was Mr. Layton who did a great deal of work in the Statistical Department?—If a professor comes into a Government Department and shows you how to do it, although he may not be an organising producer, he is a producer. I believe in the productive power of brains.

12,998. Do you know from experience how many University professors in the Ministry of Munitions told the Minister how to do things?—I could name more than one.

12,999. Is not the balance more in favour of business men?—It is only fair to say that some of the business men who came in were scientists; therefore, they were both business men and professors, which is the very best possible thing.

13,000. You told Mr. Williams that you only speak of what you know. In your proof you make the statement that, amongst other things, the Ministry of Munitions formed a Potash Production Branch, which triumphantly succeeded in making our blast furnaces potential suppliers of potash. On what basis do you make that statement?—That I took from a most interesting article which I had the pleasure of reading in a paper called the "Organiser." I did not know that of my own knowledge, because it occurred after I left the Ministry of Munitions.

13,001. That is what I call theory. You took your knowledge from a paper

2 May, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

Mr. Sidney Webb: It is not theory. You mean hearsay.

Witness: May I tell you what the paper did say? This was after I left the Ministry of Munitions, and therefore, I tell you frankly that I have no personal knowledge of it. The Ministry of Munitions in June, 1917, formed a Production Branch. The Branch might have been more fitly described the Discovery Department.

13,002. That is only hearsay?—Yes.

13,003. The actual facts, if I may give them to you, are that the inception of the potash production in this country was entirely the work of private industry, and the Government only assisted at the end with regard to the finances?—I take it from you.

13,004. That was only hearsay?—It was a little more than hearsay. It was a well considered and sober statement on the subject which everyone had a right to accept with respect.

13,005. You gave us an extract from an interesting speech by Mr. Churchill. I want to know why you did not complete the extract. You gave us an extract from part of the paragraph; why did we not have the whole paragraph?—It seemed to me a pretty complete statement in itself.

13,006. May I complete the paragraph? He said, "Well, gentlemen, I make you my hearty congratulations. I have not been quite convinced by my experience at the Ministry of Munitions that Socialism is possible, but I have been very nearly convinced. I am like one of those people who are trembling on the border line between individual enterprise proceeding in fierce competition in all industries and walks of life"?—From what are you quoting, what report?

13,007. This is the verbatim report?—It is only fair to me to say this was not in the "Times" report.

13,008. I submit as this has been brought up I might read this?—I only want you in fairness to acknowledge that I did not leave it out. There is nothing that you have read so far which contradicts what I have said. I did not wilfully omit it.

13,009. I did not suggest that you did. I want to show the danger of quoting from something that is not quite complete. Mr. Churchill went on to say: "It constitutes a new fact in the political history and experience of the world. But we must remember that the men who did this work were not official products of purely official origin. They were men who in the overwhelming majority of cases in the rough and tumble of life had already reached the top of their respective professions, and if I am not convinced by the great success of the Ministry of Munitions of the possibilities of a universal State action in regard to supply and production it is because I do not see from what new source in the future we are likely to obtain these elements of individual strength and initiative and enterprise, without which, after all, we never could have succeeded in any respect." I submit that that puts a different complexion on the first paragraph?—Yes, but it does not alter this fact, that although he had those considerations in his mind, and weighed them and gave expression to them, nevertheless he said, "I have been very nearly convinced."

13,010. He sank back again on the same side that he started with?—Forgive me, he said: "I have been very nearly convinced."

13,011. "I have not been quite convinced," and he gives the reason why he was not convinced?—He says: "I am bound to say I consider, on the whole, the achievements of the Ministry of Munitions constitute the greatest argument for State Socialism that has ever been produced."

13,012. Then he shows why it was not the argument?—He does nothing of the kind, or he could not have uttered those words.

Sir Arthur Duckham: He says even the best argument did not convince him.

Sir Allan Smith: Before proceeding with the examination of the witness, I should like to say that I propose to ask leave to postpone a section of my cross-examination.

Chairman: Certainly.

13,013. *Sir Allan Smith:* Whether the witness would prefer to have the whole examination postponed is a matter for him to say, but I propose to take a later opportunity of cross-examining the witness on the activities of the Ministry of Shipping, and also the activities of the Admiralty with regard to ship construction so far as relates to the Ministry of Shipping?—I am here to be shot at; let Sir Allan Smith do it now or at any other time that suits him.

Sir Allan Smith: Then, Mr. Chairman, I think it would be better to leave it open.

13,014. *Chairman:* And take the whole of your cross-examination later. Now, Sir Leo, do you desire to cross-examine yourself?—Is that open to me?

13,015. I am not sure?—I will consider that, if I may.

13,016. *Mr. R. H. Tawney:* I gather that your preference for nationalisation does not rest merely on the interests of the employers, it rests on the idea that a nationalised industry would serve the public more effectively?—That is so.

13,017. Am I right in thinking that you suggest that there is really not any guarantee of any harmony of interest between the private exploitation of coal and the public benefit in the long run?—That is so; I think the disharmony in that matter is of the greatest injury to the public.

13,018. For example, it may pay the individual coal owners to do what I may call "cream" the supplies of coal?—It not only may, but it has in the past. There are areas in this country where workings were left with valuable coal in them, and where the work could now be only carried on with the greatest expense.

13,019. In that case he acts like a farmer who at the end of his lease takes the best out of the land?—Exactly.

13,020. And that is a future public loss?—Exactly.

13,021. With regard to the question of royalties, we have had evidence that royalties are subject to taxation?—Yes, special taxation.

13,022. Is it your opinion that royalty owners can shift that taxation?—No, they cannot shift it.

13,023. Therefore, the value of his property is reduced by that amount?—It is really a confiscation by the State of the amount.

13,024. When you are considering the purchase of royalties would you take account of the reduction in present value by the taxation already imposed?—Most certainly.

13,025. If you did that would it mean that the price to be paid for royalties would be so many years' purchase less the capitalised equivalent to the taxation now imposed?—Yes.

Mr. R. W. Cooper: When you are talking of the taxation now imposed, are you referring to the special mineral rights duties?

13,026. *Mr. R. H. Tawney:* Yes, and there is another duty, the increment duty. On page 4 of your paper you deal with the question of the form of administration which you think might be adopted. Do you think it would be true to say there was not one main problem but two, not merely the problem of national ownership but the problem of securing the organised miners' effective voice in the administration?—Yes, I consider the second is bound up with the first. In my opinion you will never get the greatest benefit from your coal till you get social industrial responsibility in the miners.

13,027. You do not desire to see the adoption of any system of bureaucratic administration?—No; although I should like to add that a bureaucratic administration would give better economic results than the present system.

13,028. That is to say, it might serve the public more effectively, but it would not meet the labour difficulty?—It would not meet the labour difficulty.

13,029. How do you propose under your scheme that that should be met?—There are three points by which the details that I have put down seek to meet it. The miner has, as it were, three voices here. The first is his voice in the central executive which governs the general conditions in the industry. The

2 May, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

second is his voice in what I may call the district executive, which applies itself to the specific work of the district, recognising its local needs and its local customs. The third voice that he has is in the actual mine. I have there found my greatest difficulty, because of the necessity, as it seems to me, in a mine as in a ship, of giving a man a sort of personal and as it were deadly responsibility in what is going on, but I am open to receive any arguments or representations by which what I have set down in paragraph 3 on page 5 can be amended, in order to give workers what I have called in the heading the conduct of its own economy, as far as that is practically possible.

13,030. What proportion of the representatives on the administrative bodies do you desire to see nominated by the miners?—I think that the number, to give a proper confidence, which is what we desire to give to the miners, ought to be one half of the number of the executive.

13,031. And in the remaining half I suppose there are several interests to be served?—Yes.

13,032. Do you not think that that points to a rather larger central administrative Council than some of those which have been suggested?—Yes, I am afraid it does, because one must, of course, have on the central executive your mining experts. There must and there ought to be organising experts, what is commonly called the man of business in ordinary affairs. Then the consumer ought to be represented there—the consumer as a domestic consumer, the consumer as your big consumer, and it seems to me therefore necessary to bring in what would be one of the largest users of all, the Minister of Ways and Communications, and representatives of one or two of the biggest industries.

13,033. You think the consumer should be represented *qua* consumer, and not as representing the State?—I think that would be a good thing.

13,034. Have you seen the report of the German commission of socialisation?—Yes, it is a very involved document.

13,035. To return to the question of royalties for a moment, it is sometimes suggested that the reason for compensation is the necessity for allowing for established expectations?—Yes.

13,036. Do you think the expectation of the royalty owner to enjoy royalties indefinitely under present conditions is very secure?—No, I have already indicated in reply to a question of Mr. Cooper's that the royalty owners who are quite properly setting up their case for consideration must have regard to the growth of public opinion in this matter and to the fact that Parliament has already deliberately confiscated a part of those royalties and is only too likely to increase that special and penal form of taxation.

13,037. Would it be fair to put it in this way. If, as you suggest, taxation is likely to grow in the future, the royalty owners would be very lucky indeed to sell their royalties now to the State for anything like their present capital value?—That is so.

13,038. In fixing the capital would it not be reasonable to take account of the fact that this is a highly gambling stock?—Yes.

13,039. *Mr. Sidney Webb*: The Government has accepted the interim report of the Chairman of this Commission, that there must be either what we call unification, or unification with national ownership; is that not so?—Yes.

13,040. Have you considered any suggestion with regard to unification without national ownership?—Yes, I have.

13,041. Do you see any possibility of unification in private hands without national ownership being advantageous to the nation?—I think as a practical matter it is impossible. It would not be accepted by the miners, and it could not be, I think, accepted by the public.

13,042. Assuming for the moment that that is the case, that unification in the hands of a capitalist trust is politically impossible, then the Government will find itself shut down to nationalisation?—Yes.

13,043. That being so, the experiment which has been referred to is a compulsory one?—It seems so to me.

13,044. Therefore, the most practical thing we could do would be to consider the method under which this could be advantageously carried out?—If we have pure regard to considerations which take into account the world as it is and labour as it is, that is the only issue: the rest is theorising.

13,045. Theorising may be very useful, but it takes up time, of course. Now on another point you have laid stress on the importance of making an economic use of the nation's resources in coal?—Yes, I attach very great importance to that part of the subject.

13,046. Have you ever heard it suggested that the private owners of collieries have any concern for the economical use of the nation's resources in coal?—No, it is not their business, and it is not their interest. After all, the interest of the coal producer is to sell as much coal as he can put out. As an individual man he ought to get out the amount that can be got cheaply and leave the rest in the mine; that would yield him profit. That is what he ought to do as a man of business, as the term is commonly understood, that is a creature simply hungry for commercial profit.

13,047. We have been told the colliery owners have been working their collieries from the point of view of business with efficiency. If they are working them with efficiency, it must mean that they are working them without regard to the future interests of the community on your showing?—If the sole object is commercial profit. If this delightful theory is accepted that private gain is the only possible and the only admitted motive which moves human creatures, if that is true, it is a deadly thing for the coal industry and for every industry.

13,048. To come to practical considerations, have you discovered any way by which the future resources of the community in coal could be served under a system of private management of the collieries?—It is possible to conceive that your great capitalist trust would reduce the working of the system to mechanical economy, using the best appliances, and so forth. It is possible to conceive of that trust coming into the hands of a man, a masterful personality who insisted on the workings being well used. These are all possibilities, but I am afraid they are not likely.

13,049. You would not advise the nation for the conservation of its future supply of coal in any such possibility to place it in the hands of a national trust?—No; I go by America, where the trust has reached a high degree, where, before the war, there was a Commission appointed to investigate the operation of the trusts in the United States, where Judge Gary, of the United States Steel Corporation, gave evidence for the Corporation, and he recommended the Government that it ought to take control of the trusts, settle prices, and so on.

13,050. The Government of the United States have become convinced of the danger of leaving the exploitation of these national resources in capitalists' hands, and this Commission made this very momentous report on the subject, which has been, unfortunately, so much neglected by our English capitalists. On the question of the national trust, would you not suggest that those who wish this Commission to report against nationalisation—we might ask them, might we not, to put forward some sort of scheme by which the nation would be protected in this respect without nationalisation? We have not had any such scheme?—I think it is only fair that those who defend the present system, or those who think they are entitled to think they can so amend it as to better suit the needs of our times, should be asked to put up a scheme.

13,051. Presently, when Whitsuntide comes, we shall be able to receive no more evidence, and probably we shall be told we have not heard the other side. Have you heard of that?—I can quite conceive the possibility, and I hope schemes will be furnished for our detailed criticism. I think they ought to be examined like those of other people.

2 May, 1919.]

SIR LEO CHIOZZA MONEY.

[Continued.]

13,052. *Mr. Frank Hodges*: Mr. Williams rather put it to you that you were not amenable to suggestions for the modification of the present system?—Yes.

13,053. On the contrary, that you were, so to speak, case-hardened on nationalisation. Have you near you a report of the Chairman, Mr. Arthur Balfour, Sir Arthur Duckham and Sir Thomas Royden? On page 5, paragraph 9, is to be found this statement: "Even upon the evidence already given the present system of employ and working in the coal industry stands condemned"—That is so.

13,054. In the light of that, do you consider that it is competent for you to give further consideration to a modification of the existing system?—Really one must speak as a practical man of affairs. It seems to me that as this Commission, or rather four members of it, headed by the President, have made the report as read, which was backed by six other members who went further in that direction, that therefore a majority of ten of this Commission favoured change, that is to say, 10 out of 13, and that the Government, having considered that, came to the conclusion that they would accept the Chairman's report; and it is therefore, for us, as practical men, to build upon that and to advance from that point and not to go back upon it. That is my view.

13,055. If I were to put it to you, therefore, that you are amenable to consider systems other than the existing system, whether it be a nationalisation system or not, that would be stating the truth?—Yes; but, at the same time, possibilities are great, and we know we have not seen the scheme of the other side. If the other side came along with a scheme so good that it seized upon our intelligence in such a fashion that we should say this must be done, then, in spite of the President having advised the Government, as he has done, we must impress upon the President to advise something different.

13,056. Providing it was not a modification of the present system?—That seems clear to me.

13,057. In taking a broad view of an industry such as this, is it proper to consider other elements than mere elements of production and mere economic elements, such as the human factors?—Absolutely. The object of work, the object of industry, is to make happy lives. There is no other object; and, that being so, I have no use for economics or any commercial system that does not recognise that fact.

13,058. Therefore, whether he be an employer or whether he be an economist, or whether he be a trade-union leader, if he is to give an accurate judgment upon an industry such as this, he could only do it if he took into consideration the aspirations of the million men engaged in the industry?—That is so.

13,059. And, if he does not take that into consideration, do you think he is competent to give a judgment?—If he does not take into consideration the aspirations of the human element of the industry, then he is not in the true sense of the word a practical man.

13,060. And he is to make himself acquainted with the thoughts of the men in the industry, one would think?—That is so; that is essential.

13,061. Are you aware, Sir Leo, that in the various expressions of thought that are sometimes heard of amongst the workers in this industry one hears of such a phrase as "The class struggle"?—Yes.

13,062. What would you think that exactly means?—I think it means that the men engaged in work are increasingly becoming conscious that they do not own the means without which their work cannot be done, and that therefore they feel at a disadvantage which is immoral.

13,063. And would I be right in describing it as a feeling that they were under this system perpetually at war with some other class in the industry?—Yes; they perceive it is a system with a certain product for part of which, with uncertain information, they have to struggle continuously, and that they also see, I think it is true, that this does not arise from the fact that the employers are worse men than they are, or more grasping than they are individually, but merely they are working a bad system which they desire to end.

13,064. If the aspiration took the form of a belief that they could do without the profit-making interests in the industry would not that have to be taken into consideration in building up a new system?—Yes, it seems to me so.

13,065. Under any system that is proposed to substitute the existing system if the happiness that you suggest as the legitimate lot of the worker is to be obtained you must provide against building an institution which will re-establish this conception of the class struggle?—Most certainly. That is why I personally sympathise with those who are workers who object to profit sharing.

13,066. And do you see in a trust any such hope?—I am afraid I do not.

13,067. Have you in America, for example, which you I believe have studied at considerable length, where you have had the growth of national trusts, noticed any harmonising in the relations between workmen and other employers?—Far from it.

13,068. What have you seen there?—I have seen, and all the records seem to point to much more embittered feelings, that the man up against a huge trust feels himself up against something more formidable than when confronting a small or moderate-sized employer; he feels even more a cog in the machine than before; even more soulless, more put upon, and that is a system which even less than the other gets the best out of the man.

13,069. *Mr. Robert Smillie*: The feeling has got about that Mr. Webb and yourself have given evidence as miners' witnesses. You do not wish that to be understood, do you?—I come here as an independent man. I am one of the most independent men in this country.

13,070. As a matter of fact, you are not giving evidence on behalf of the miners?—No.

13,071. It is possible the miners themselves might disagree with some of the views expressed by Mr. Webb and yourself?—Quite. I purposely did not show my *présis* to you, Mr. Smillie, or the other miners' representatives, and, for this reason, that I wanted it to be a perfectly independent production.

Mr. Robert Smillie: I wanted that to be perfectly clearly understood.

Sir Arthur Duckham: On Mr. Smillie's last point, a lot of that trouble arises from the expression "our side" and "your side"?

Sir L. Chiozza Money: Yes. It is only due to those who give time to this Commission that it should be known it is independent.

(The Witness withdrew.)

Chairman: There are two witnesses I want, if possible, to finish before luncheon. After that, I am calling the last economic expert, Mr. Cole. After all, gentlemen, I should like to remind you we are going to report by June 20th this year—not next year. No doubt these two witnesses we shall pay great attention to, and I ask you to restrict your cross-examination. I have had already given to me a list of over 80 witnesses, and there will not be time to call everybody. We have already given a fortnight to this part of the inquiry.

Sir L. Chiozza Money: Sir Allan Smith promised he would cross-examine me with regard to shipping matters. Of course, I have held a confidential position with the Minister of Shipping. If Sir Allan Smith's questions raise points of high policy for the War Cabinet's decision, am I entitled to produce to this Commission confidential documents?

Chairman: Perhaps you will ask that when it arises. If Sir Allan does not ask you I shall not have to give a ruling. If he does I shall be quite prepared to give a ruling then.

2 May, 1919]

MR. ARTHUR GREENWOOD.

[Continued.]

MR. ARTHUR GREENWOOD, Sworn and Examined.

Chairman: Mr. Arthur Greenwood is a late Lecturer in Economics in the University of Leeds, Assistant Secretary of the Ministry of Reconstruction. He starts his proof by saying, "The views herein stated are purely personal and are not to be regarded as committing the Ministry of Reconstruction in any way." He says in his proof:

"I. The future organisation of the coal mining industry must be regarded from the point of view of post-war needs and the new circumstances which have arisen out of the war. The following are amongst the chief factors which must be kept in mind:—

- (a) The heavy war debt and the claims of the workers for considerably higher standards of life than obtained before the war, necessitate greater productivity.
- (b) Greater strain than in the past will be put upon our industrial system owing to the increasing intensity of foreign competition.
- (c) There is a strong demand amongst organised workers for an effective voice in "the control of industry."

II. Points (a) and (b) imply the need for improved industrial organisation and increased efficiency. Amongst the main lines of development are better methods and machinery, greater use of power, and efficient transport. The relation of the coal mining industry to these is very close. Point (c) has a direct bearing upon the future organisation of the coal mining industry.

III. The coal mining industry cannot be considered alone. It must be regarded in relation to the economic system of which it is so fundamental a part. Coal mining is one of the basic services. The real "key industries" of the country are *power supply* and *transport*, and with these coal mining is inextricably interwoven. The place of coal mining in the future will be determined more particularly by the importance which is assigned to power and transport. There are clearly other aspects of the coal industry problem, but from the national point of view coal is primarily important because of its bearing upon power production and transport.

Whatever internal improvements the various industries may make, the country's economic capacity depends very largely upon its system of power supply and its transport system. These two services lie behind every industry; they are the pre-requisites of modern industrial activity. In the attainment of high efficiency in production, such as is essential in the future, the importance of power supply and transport is obvious.

IV. With regard to *power*, the question has engaged the attention of three Committees—the Electric Power Sub-Committee of the Coal Conservation Committee, Sir Archibald Williamson's Committee and the Advisory Chairmen's Committee of the Ministry of Reconstruction. These enquiries have been concerned with the formulation of a national scheme for the production of electricity on a large scale by the conversion of coal into electrical energy. It would appear that industry will, except perhaps in special circumstances, resort more and more to electricity, and that electricity will in the twentieth century play as vital a part in industrial development as steam did in the nineteenth century. In the past, however, individual businesses produced their own power from their own fuel; in the future power will be transmitted to consumers, directly or indirectly, from central power stations, generating electrical power almost entirely from coal. This will lead to an extended use of power, but it will also make a breakdown of the supply extremely serious.

V. With regard to *transport*, it is generally agreed that the development and co-ordination of the transport services is a vital need of the future. The railways are the most important form of inland transport, and the electrification of the railway system has already been foreshadowed by Sir Eric Geddes. An expanded transport system would probably utilise electricity to an increasing extent.

VI. Both these "key industries,"—power supply and transport—assume an adequate, regular and cheap supply of coal. The coal mining industry, therefore, will in the future occupy an even more important position in our national economy than in the past. If the power and transport services are regarded as "key industries," coal mining is a "super-essential industry."

VII. The future of the coal mine is, therefore, more than an economic question. It is a question of high national policy. The problem is not whether nationalised coal mines will pay or not,—though this must be considered—but whether the production of a commodity which is the mainspring of modern economic life should be allowed to remain in private hands.

The fact that the central power stations (producing electricity for the industries and railways of the country) will become the main consumers of coal will probably be sufficient to stimulate the consolidation of the mining interests, whilst the evidence already received by the Commission would seem to point to some method of unification. The choice, therefore, lies between some form of private monopoly and State ownership. In view of the fundamental character of the coal mining industry, I am of opinion that it should be transferred to national ownership.

VIII. The British coal supply has been an important factor in the prosecution of the war, both as fuel and power and as the source of materials for the manufacture of chemicals and explosives. Without this national asset, the course of the war would have been very different. In times of peace, the coal supply is of no less value, quite apart from the questions of power and transport. We have been the chief exporting nation in the world and we possessed the greatest navy and mercantile marine prior to the war. We possessed the chief coaling stations on the sea routes. Our steam coal was a virtual monopoly. Neither oil nor electricity is likely to supersede coal for a considerable period. Moreover, the coal by-products, upon which certain industries are dependent, will increase rather than diminish in importance in the future. Coal is therefore one of the foundations of national prosperity.

The statements in this paragraph might not be in themselves sufficient to justify the nationalisation of the coal mining industry, if coal were a reproducible commodity. But the coal supply is limited, and as greater and greater demands are made upon it this form of national capital will progressively diminish. It may be argued that there are large supplies of coal which will take long to work out, and that in the meantime new sources of power will be developed. But the State must take the long view, and it cannot afford to gamble with the future. It is the inevitable weakness of private ownership that it does not take the long view. This is not, however, so serious in the case of reproducible commodities. The case of exhaustible national resources stands on a different plane, for once they are exploited they cease to exist.

IX. The importance of coal in this country is unique. It is limited in amount, and therefore there should be a "long-period" policy of conservation and exploitation. Our power supply and transport services depend on coal. It is the source of supply for valuable products; it is an important export and one which is destined to become more important in the future. There is probably no commodity in regard to which the claims of nationalisation are stronger.

X. So far, I have not assumed the nationalisation of electric power supply and railways. If, however, the scheme of the Sub-Committee of the Coal Conservation Committee is adopted by the State and the railways are nationalised, the need for a national coal supply would become more imperative than ever. Private ownership of coal and national railways and electricity supply would create an unstable equilibrium which must sooner or later prove intolerable.

XI. Practical statesmanship demands that the chief "key" industry of the modern world should be adequately safeguarded and developed, subject to a

2 May, 1919.]

MR. ARTHUR GREENWOOD.

[Continued.]

broad national policy. The problem of the future of the coal mining industry is not to be solved by balancing potential economic gains and losses within the industry itself under alternative forms of organisation, but by having regard to the service which the coal mining industry, if organised and directed to the attainment of a national end, may render to the whole economic life of the country. From this point of view, the national ownership of the coal mines is desirable.

XII. Unification within the coal mining industry appears to be inevitable. The alternatives are some form of private monopoly and some form of public monopoly. Whatever shape a private monopoly may take, it is obvious that it would need, in the public interest, to be subject to stringent State regulation. Such regulation would almost certainly limit in some degree the gain to be derived from the working of the coal mines. If gain be the prime incentive in industry, the effect of prices and profit regulation would be to weaken the efficiency of the coal mining industry. If it did not, one argument against nationalisation falls to the ground.

In any case, regulation would need to be carried to great lengths if coal consumers are to reap the fullest benefits from unified management. Either State interference would in fact enter into the detailed administration of the mines and destroy the advantages of private management or it would be insufficient to protect the consumer against arrangements to the private advantage of those engaged in the industry.

Moreover, it is by no means certain that a private trust, however composed, would have sole regard to the public interest. With the maintenance of economic motives and standards, the tendency would be to get the maximum return allowable with the least possible amount of worry and trouble. The consumer might benefit to some extent, under a trust, but the full advantages of unification would not accrue to coal users. It is improbable that a trust would take the long view and the wide view. There is, indeed, no reason why it should. Its object would be to secure the maximum return to those with interests in the industry.

Broadly speaking, a private monopoly under strict State regulation would lose the advantages of both private management and public control. The co-operation of the mine workers in a private monopoly would not alter these conclusions.

XIII. The other alternative is a public monopoly. It is often argued that State management is inefficient; but the conclusions already reached by the Coal Industry Commission are sufficient to show that in coal mining, at least, individual initiative and the prospect of private gain do not appear to have resulted in a high standard of efficiency in the industry as a whole. On the other hand, the Post Office is a well-managed institution of enormous service to the industrial and commercial community. It is not suggested that the Post Office is comparable in all respects with a manufacturing industry, but it is, at any rate, an instance of State enterprise which effectively performs its function.

The alleged advantages of private initiative and the alleged disadvantages of public enterprise arise partly from the ignorance of the public of the inefficiency and scandals of the former and the critical observation of the latter, together with the publicity which any inefficiency in State enterprise invariably receives.

It has been said that State interference has been the cause of innumerable blunders during the War; there is some truth in this, though it must be remembered that State Departments affecting industry have been largely reinforced by business men, who must take some share of the responsibility. On the other hand, State control has been of considerable assistance in improving methods in industry and increasing efficiency.

The extent to which industries are dependent upon the motive of private profit is often less than appears. It cannot be denied that a large number of the technical and administrative experts in the coal mines

serve for a fixed salary. Their services will presumably be required if the coal mines are nationalised. The question, therefore, is whether the maintenance of the incentive of profit for a number of working colliery proprietors will render the industry more efficient than under State ownership. To answer in the affirmative is to exaggerate the importance of those whose earnings are called profits.

XIV. There are certain dangers to be avoided in a nationalised system of coal mines. In the first place a whole industry under a single ownership lends itself to centralisation and bureaucracy—a defect which is not wholly absent from very large enterprises, whether under private or public control. In this respect a coal trust might not be greatly different from a public monopoly. This danger is to be met by decentralisation.

Secondly, Government administration tends to become conservative and inelastic. This danger might be overcome by attaching to the central administration for a term of years men with experience of "provincial administration" in the coal mining industry and by the pressure of public opinion, for the coal mining industry will be keenly watched by the whole industrial community.

XV. The following is an outline of a national scheme:—

(A) CENTRAL ADMINISTRATION.

(1) *Coal Production Council.*

This body, composed of an equal number of administrative officials and mine workers drawn principally from the Provincial Councils, together with a secretariat, should be presided over by the Minister responsible to Parliament for the national coal mines, or his deputy.

It would have control, subject to Parliament, of the production of coal, technical and research questions, methods of production, labour conditions, etc. Its general functions should be to secure by the most efficient methods an adequate supply of coal.

(2) *Coal Consumers' Council.*

The Coal Consumers' Council should consist of representatives of industries, municipalities, co-operative societies, and Parliament (as representing the general body of consumers), together with a secretariat, and should be presided over by the Minister or his deputy.

It would consider all matters common to coal consumers, including transport rates and methods, and methods of distribution.

It would probably be found desirable to hold joint meetings of the two Councils from time to time.

(3) *Ministerial responsibility.*

The Minister responsible for mines would be called upon to defend the policy of his department in Parliament. Clearly, therefore, the policy adopted would need to be one he could support. In practice, however, this would not mean that his Councils would be without authority. But it would mean that in the rare cases where his views were in conflict with those of one of the Councils, he would have the right of decision and the duty of defending that decision in Parliament. There are two important questions on which difficulties might arise—the price of coal and the remuneration of the mines employees. The former might generally be determined (if and when alterations were necessary) by negotiation between the two Councils on the basis of published returns regarding costs. In disputed cases it would be determined by the Minister, who would, if he found it advisable, refer the matter to the Cabinet. The remuneration of the employees where difficulty arises would be dealt with by negotiation between the representatives of the employees concerned and the Minister.

(B) PROVINCIAL ADMINISTRATION.

In each coalfield there should be a Council constituted on similar lines to the Central Coal Produc-

2 May, 1919.]

MR. ARTHUR GREENWOOD.

[Continued.]

tion Council, which should have freedom of action subject to observance of the decisions of the Central Council. The members should be drawn principally from those engaged in the coalfield.

Similarly, there should be a Committee composed of representatives of the administrative and manipulative staffs of each colliery, to deal with questions pertaining to the colliery, subject to the general decisions of the Central and Provincial Councils.

(C) RELATIONS BETWEEN CENTRAL AND LOCAL ADMINISTRATIONS.

Exactly how the conduct and administration of the coal mining industry should be divided between the Central, Provincial and Colliery Councils is a matter upon which expert knowledge is necessary. It is clear that matters of general policy affecting the whole industry must be dealt with by the Minister and the Central Coal Production Council and that the Colliery Council should not take action which is not in harmony with the policy of the Central and Provincial Councils. The relations between the Central and Provincial Councils are less easy to define. I believe that the present organisation of those engaged in the coal-mining industry has in the past allowed considerable power to districts, and that the customs, methods and conditions of the industry show variations from field to field. This would point to giving considerable autonomy to the Provincial Councils, though the need for a national policy is, of course, apparent.

There is a distinct advantage in constituting the Provincial Councils mainly from the Colliery Councils and the Central Coal Production Council mainly from the Provincial Council. At the same time it should be possible on those Councils to have official representatives of the organisations of administrative officials and mine workers.

(D) COAL DISTRIBUTION.

If there is to be a unified system of coal production there is an obvious advantage in reducing the number of direct purchasers of coal. Within the distributive trade, also, it appears that large economies are possible. To organise and develop the productive side of the coal industry and leave existing methods of distribution undisturbed would deprive industry and the general body of consumers of some part at least of the economies resulting from improved production.

Already co-operative societies have successfully undertaken the distribution of coal to domestic consumers, and further developments are possible along those lines.

In the first place I would suggest that county and municipal councils should be empowered to undertake the distribution of coal within their areas. It would probably be found advisable to add to the Coal Committees of local authorities representatives of coal consumers. Where a local authority did not desire to undertake coal distribution it should be allowed to devolve the trade upon a co-operative society or a specially constituted consumers' society. These organisations would need to conform to general conditions laid down by the State. It might be considered desirable to allow consumers' societies to cater for the needs of particular areas or sections of the population, the local authority undertaking the remaining distribution. As the prices of coal would be determined centrally on the basis of total cost plus a reasonable allowance for distribution, additional gains from more efficient distribution would accrue to the local authority or the consumers' societies.'

13,072. *The Chairman*: I propose to ask one gentleman on each side to ask any questions, if he desires to. Mr. Tawney, do you desire to ask any questions?

Mr. R. H. Tawney: Yes, one or two.

13,073. You approach the question, I understand, from the point of view of the public interest in coal, of the public service?—Yes.

13,074. The reasons you give for nationalisation are, first, it is what is called the key industry?—Yes.

13,075. Secondly, in view of the possible development of railways and power it may be specially important to protect the State?—Yes.

13,076. Have you seen any scheme short of nationalisation which you think would produce comparable results?—I have not seen any scheme at all that has been put before me with regard to the future of the coal mining industry dealing with it in detail. One can only imagine schemes that might be put up by other people.

13,077. I think you were Secretary of the Committee that produced the Whitley Report?—That is true.

13,078. Is it your view that the Whitley Report is an alternative of nationalisation?—Oh dear no, not at all. May I explain the object of the Whitley Committee was to discuss the relation between employers and employed. That is of extraordinary importance, but not the same as dealing with nationalisation with regard to ownership of industries.

13,079. You have much experience of what is called Industrial Councils?—A certain amount.

13,080. Do you think any kind of joint Industrial Council is likely to solve the labour problem in the mining industry?—From my knowledge of a few coalfields and miners in them I should say not.

13,081. Do you think under nationalisation a joint Industrial Council would be as practicable as of even more practicable than under private ownership?—I think it would be more practicable. I imagine from what I know of the coal miners—it takes two sides to make a Council—the miners would be unlikely to agree to a joint Council under private ownership. That is my impression.

13,082. That is to say, have you any experience of profit-sharing schemes?—Only theoretically; that is to say, only such knowledge as I have from books. I have never taken part in any profit-sharing scheme.

13,083. Do you think any profit-sharing scheme from what you have read offers any effective alternative to nationalisation?—Not at all. The objects are quite different, in my judgment.

13,084. With regard to nationalisation, you attach some importance, I think, to avoiding excessive centralisation?—Very much.

13,085. You do not contend the whole mining industry should be administered from Whitehall?—No, I think it would be administered all over the country, of course.

13,086. In fact, nothing of the kind is involved in nationalisation?—You mean centralisation?

13,087. Yes?—Not necessarily.

13,088. The problem of how exactly you are to organise the industry remains for subsequent settlement?—Yes, I think it must. I think it is important to lay down a general principle that nationalisation should be carried out with a maximum of decentralisation. The precise scheme would clearly have to be worked out.

13,089. You say there are two possibilities of private combine or trust and public combine or trust. Do you think that any system of safeguards which you have ever seen or have read about in relation to a private trust will really either protect the public or secure industrial peace?—I do not think so, and, even if it were so, I think they would have to be so detailed in their character that there would not be any private enterprise left on the part of the trust.

13,090. That is to say, if it is the case that profit is the motive of industry, any conceivable kind of trust in private hands would have to be so regulated as to check that motive?—That is what I mean—quite.

13,091. *Mr. Frank Hodges*: Can you tell me if under private ownership of the mining industry you can arrive at any point at which the interests of the employers and employed become identical?—From my knowledge of miners in many parts of the country I cannot conceive such a point, personally.

13,092. What would be the nearest approach to an identity of industry between mine owners and the miners, do you think?—I should suggest under a nationalised scheme with the administration I have outlined very briefly you would get it there; I mean they both would be in the position of servants and the distinction which now obtains would not obtain.

2 May, 1919.]

MR. ARTHUR GREENWOOD.

[Continued.]

13,093. You did not follow me, I am afraid. I assume the private owning system exists in the industry, and we are all anxious the industry should move as smoothly and progressively as possible. At what point do their interests approximate; at what point can they approximate?—So far as the output of coal is concerned they have considerable common interests. So far as the division of the produce of selling coal is concerned their interests are opposite.

13,094. Supposing the owners wish to sell their product at the highest possible price and pay the wages to the workmen at the highest possible rate, do you think that would approximate the interests of the two parties?—The interests of the two parties, you ask?

13,095. Yes?—I should say not, judging by the change of opinion amongst miners, whose objects are not purely economic.

13,096. Therefore you say no matter what wages a workman gets, so long as he gets wages, whether they be the highest possible wages that would not entirely satisfy him?—I would not like to say that. I can conceive in several industries that that would be so, but I think amongst the miners it is not so.

13,097. *Sir Arthur Duckham*: You speak of these electrical developments in this country. That is very much in embryo in this country?—Yes.

13,098. It will be a good many years before it comes through?—I do not exactly follow you.

13,099. They speak of the way of treating the coal before they use it?—Ycs.

13,100. There is nothing definite on that subject known at the present time?—That is so.

13,101. They speak of these 100,000 kilowatt units?—Yes.

13,102. There is nothing known of this. It is theory, we agree, but not practical at the moment. The idea of centralisation is practicable, but the lines on which they base their arguments are more or less theoretical at the present moment?—Except there is a certain amount of experience of electricity production in the past, that is true; but that does not in any way invalidate my argument.

13,103. I only wanted to bring out it may take a good long time?—The period of recovery from the effects of war will be a long time.

13,104. There is one other statement. It is undoubtedly the view of private owners it does not take a long view. Is that correct of all private ownership?—I should say so.

13,105. Take the case of Lever Brothers and other firms that buy plantations in Africa, or take the paper people who have taken up planting trees to make paper. That takes a long time?—It is, in my view, fairly immediate profit.

13,106. In planting trees it may take 20 or 30 years for them to grow?—Bryant and May's would not consider the possibility of afforestation to supply their timber. The results would not accrue for perhaps half a century.

13,107. The paper people are planting trees?—I believe that is so.

13,108. *Mr. R. W. Cooper*: You quote the miners with whom you have come in contact. To what particular parts of the country were you referring?—Yorkshire, Derbyshire, North Staffordshire and South Wales.

13,109. Have you come across them at all in Lancashire?—No, I cannot say I know many Lancashire miners.

13,110. I suppose this question that you have been discussing may be described as being partly political and partly economic?—It is a question of emphasis. I regard it as predominantly political, but not in a party sense.

13,111. Therefore, I suppose, that being the case, it is more essentially a question for decision by Parliament than by this Commission?—Oh decidedly, of course.

13,112. As regards the political aspect of the matter, have you taken any part in political life yourself?—I have.

13,113. To what extent?—Well, to the extent of fighting an election.

13,114. Where was that?—That was at Southport.

13,115. In Lancashire?—Yes. Southport is not typical of Lancashire, I would suggest.

13,116. To a certain extent you have already made a public confession of political faith?—Yes, precisely.

(The Witness withdrew.)

MR. GEORGE DOUGLAS HOWARD COLE, Sworn and Examined.

Chairman: Before we read Mr. Cole's proof I think I ought to say for the assistance of any gentlemen who are going to give evidence on the royalty question, I am sorry we cannot reach them to-day. I am very sorry after having given them the trouble of being here. We shall take them first on Tuesday. This gentleman's evidence will take some little time and we adjourn at 4 o'clock this afternoon. These gentlemen who are in attendance on the royalty question can be released.

Mr. Leslie Scott: Are the witnesses on Tuesday to be those mentioned by Mr. Smillie. I simply ask for the sake of convenience.

13,117. *Chairman*: I do not know if we shall get to them. Certain witnesses we have of my own and then will come yours, and then will come those gentlemen called by the Commission. The gentlemen specially mentioned need not be here until Wednesday. This witness is Mr. George Douglas Cole. He is a Fellow of Magdalen College, Oxford, Hon. Secretary, Labour Research Department, Executive Member, National Guilds League. I will ask the Secretary to read the whole of his evidence.

The Secretary:—

"INTRODUCTORY.

1. It is stated in paragraph IX. of the Interim Report, signed by the Chairman and three other members of the Commission, that "even upon the evidence already given, the present system of ownership and working in the coal industry stands condemned, and some other system must be substituted for it."

In this opinion I concur.

2. Six of the members of the Commission state in paragraph 3 of the Summary of conclusions in their Interim Report that "in view of the impossibility of tolerating any unification of all the mines in the hands of a Capitalist Trust—in the interest of the consumers as much as in that of the miners—nationalisation ought to be, in principle, at once conceded."

In this opinion also I concur.

3. In paragraphs X. and XI. of the Interim Report, signed by the Chairman and three other members of the Commission (but not in paragraph IX.), nationalisation and joint control appear to be presented as mutually inconsistent alternatives. Whether this is so or not would appear to depend upon the parties among whom the control is shared or divided.

4. In paragraph XII. of the same report it is stated that no scheme for joint control has been placed before the Commission; but among the papers circulated to me is a statement submitted by Mr. Straker, who gave evidence on behalf of the Miners' Federation of Great Britain, and this statement embodies a scheme of national ownership combined with joint control by the miners and the State.

With this scheme I am generally, and largely in detail, in agreement.

5. In July, 1918, the Conference of the Miners' Federation at Southport unanimously adopted the following resolution:—

"That in the opinion of this Conference the time has arrived in the history of the coal mining industry when it is clearly in the national interest to transfer the entire industry from private ownership and control to State ownership,

2 May, 1919.]

MR. GEORGE DOUGLAS HOWARD COLE.

[Continued.]

with joint control and administration by the workmen and the State. In pursuance of this opinion, the National Executive are instructed to immediately reconsider the Draft Bill for the Nationalisation of the Mines . . . in the light of the newer phases of development in the industry, so as to make provision for the aforesaid control and administration when the measure becomes law."

This Resolution seems to me to embody the policy that ought to be adopted in the reorganisation of the coal mining industry which is admitted to be necessary by all those members of the Commission who have not a direct financial interest in the retention of the existing system.

5. My reasons for desiring a system of ownership and control similar to that advocated by Mr. Straker fall under a number of heads:—

- (a) Reasons for desiring direct and adequate participation by the workers in the management.
- (b) Reasons for desiring participation of persons nominated by the State in the management.
- (c) Reasons for desiring national ownership.

Reasons for Workers' Participation.

6. The workers employed in and about collieries should assume a direct and increasing share in the management, not only in order that the principles of democracy may be applied to industrial organisation, but also in the interest of the consumers and of the community. We have reached a stage in certain vital industries, including coal mining, if not in industry as a whole, when the workers will no longer consent to remain within the boundaries of the wage-system.

7. By the wage-system I mean a system under which the worker sells his labour to an employer in return for a wage, and by this sale is supposed to forego all right over the manner in which his labour is used within the terms of the wage-contract, all right to exercise control over the management of the industry or service in which he is engaged, and all claim to the produce of his labour or to the common product of the labour of himself and his fellow-workmen.

8. Thanks to the growing strength and consciousness of Trade Unionism, this wage-system is no longer fully and completely operative. Trade Unions do constantly, by collective regulation of the conditions of labour, by collective bargaining, and by strikes, exercise a certain control over the way in which the labour of their members is used, and even over management. But, excluded from direct participation in management and control, Trade Unions and workmen are confined in the main to the imposition of negative forms of control, *i.e.*, virtually to a veto on certain methods of using and organising labour. Such negative regulation inevitably tends to take a restrictive form, which becomes more severe as Trade Unionism becomes stronger, until it threatens to break altogether the system—the wage-system—in which it is enclosed.

9. In the words of the Memorandum submitted by the labour representatives to the recent Industrial Conference, "Labour has now grown too strong to be controlled by force or compulsion of any kind." The method of destroying Trade Union "restrictions" by a frontal attack upon Trade Unionism is therefore not only undesirable but in practice impossible. The only alternative is a frank acceptance of Trade Unionism, and an endeavour to convert the negative (and therefore partially restrictive) control which it now exercises into a positive (and therefore co-operative) control.

10. In other words, the problem of industry at the present time—and of the coal mining industry in particular—is to enlist the active co-operation of the workers and of their Trade Unions in making the industry as efficient as possible.

11. This involves the establishment at once of the greatest amount of industrial democracy (that is, of direct control by the workers and their Trade Unions) that is immediately practicable, and the most rapid extension of that control that is practicable subsequently.

12. Such control is not only, or mainly, a question of wages, hours and conditions of labour as ordinarily understood; it includes the whole conduct of the industry, both in its productive and in its business aspects. Especially does it include the whole domain of financial and productive management and of supervision.

13. I am not unmindful of the enormous importance of technical and expert assistance, both in normal mining operations, and more especially in carrying out the great changes that are necessary in connection with the reorganisation of the industry. But I am of opinion both that technical and expert assistance can be combined with control by the workers at least as well as with control by private capitalists, and indeed that the natural affiliation of the brain-worker is with the manual worker rather than with the capitalist. To this point I shall return at a later stage.

14. In short, from the point of view of the coal consumer and of the community as a whole, the only way of securing efficiency in production—perhaps the only way of securing at all the continuance of industry—is to enlist the active co-operation of the workers by agreeing at once to the assumption by them of a substantial share in control.

15. I shall now attempt to state the case for direct participation in control from the standpoint of the worker himself. Human freedom, where it exists, is not a name, but a living reality. It implies, not the absence of discipline or restraint, but the imposition of the necessary discipline or restraint either by the individual himself, or by some group of which he forms, and feels himself to form, a part. A democratic or "free" system of government is one in which every individual not only has a share or vote, but also feels that his share or vote is of some effect by virtue of his community with his fellow-sharers or fellow-voters.

16. This principle of freedom should apply to industrial organisation, which forms in a modern community so important and so insistent a part in a man's life. It does not apply under the existing system of conducting industry; and it cannot be made to apply fully in a day or a year. But it should be our object to apply it as fully as we can, and ever more fully.

17. If, then, a man must receive orders, he must, if he is to be free, feel that these orders come from himself, or from some group of which he feels himself to be a part, or from some person whose right to give orders is recognised and sustained by himself and by such a group. This means that free industrial organisation must be built on the co-operation, and not merely on the acquiescence, of the ordinary man, from the individual and the pit up to the larger units.

18. Only the increasing adoption of this method of industrial organisation can give the sense of fair treatment and active co-operation to the worker, and thereby, through the removal of unrest and the stimulation of effort, efficient production and service to the consumer and to the community.

19. With the question of national ownership I deal at a later stage; but I desire to point out here, that national management by itself will not secure the full co-operation of the workers. State management means in practice management by a State Department; and a State Department is not a "group of which the ordinary man feels himself to be a part." The workers under State management are no more free, so far as the conditions of their working life are concerned, than the workers under capitalist management. The question of joint control with the State is dealt with further below.

20. Joint control with the present owners or with the consumers would also be ineffective. The reasons for this are also dealt with below.

Reasons for Participation by the State.

21. The "control of industry" includes two distinct functions, the actual management of productive and distributive enterprise, and the ultimate financial control. I desire to deal with these separately.

2 May, 1919.]

MR. GEORGE DOUGLAS HOWARD COLE.

[Continued.]

22. The reasons for State participation in actual management are, to a considerable extent, of only temporary validity. If the whole effective working personnel of the mining industry were combined in a single group possessed of a feeling of community, and including not only the workers and clerks, but also all the supervisors, professionals and experts necessary to the conduct of the industry, direct participation by the State in the normal work of management would be unnecessary. It is my hope that this position will gradually be reached, and, to that extent, that direct State participation in management will be gradually withdrawn.

23. Until this becomes possible, the State should appoint as its representatives on the Mining Council (excluding for the moment those appointed to represent the consumers) persons of professional or expert knowledge of mining operations.

24. The function of the State, therefore, in relation to productive management, is mainly that of safeguarding the technical efficiency of the industry until the creation of a complete Mining Guild becomes possible.

25. It is also suggested that the State appointments to the Mining Council should include persons specially appointed to represent the consumers. Whether this also would be a transitional measure, I am unable to make up my mind. It is, however, clearly necessary that the consumers of coal should have some means

of ensuring that their views will be heard, especially in relation to questions of coal distribution and the allocation of supplies to various districts.

26. Direct appointment of the consumers' representatives by organisations representing the main groups of coal consumers has been suggested; but I am unable to agree to the suggestion for two reasons:—

- (1) because the groups of consumers are changing groups and, therefore, their names ought not to be included in an Act of Parliament (*c.g.*, if coal distribution is made a municipal and/or a co-operative monopoly, the retail coal trader, who is now an important consumer, drops out of existence);
- (2) because I am unable to accept the view that an employers' association in, say, the steel industry is a proper representative of the consumers. The workers in the steel industry are fully as interested in the supply of coal as the employers.

These reasons are not intended to exclude consultation by the Government with consumers' associations in appointing the consumers' representatives on the Mining Council. But, pending the development of some more effective means of representing the consumers on democratic lines, the State must be regarded as the warden of the consumers' interests.

(Adjourned for a short time.)

The Secretary:—

"Financial Control.

27. I come now to the question of ultimate financial control. This involves (a) scrutiny of the balance sheet of the Mining Council, (b) ultimate control of prices, (c) provision of capital, (d) utilisation of the balance of revenue over expenditure, and (e) methods of expropriation, redemption, &c.

28. These are functions which concern the State as the representatives not of the consumers but of the community as an association of neighbours or citizens. Whatever may be the future structure of political society, they are for the moment functions properly to be exercised by the people's representatives in Parliament.

29. At the same time, the existing organisation of Parliament does not provide for their satisfactory exercise. I suggest a Committee of the House of Commons, presided over by the Minister of Mines, to consult with the Mining Council, and to take administrative action in these matters, subject to the sanction of the House as a whole.

30. This implies that any surplus of mining revenue over expenditure, or expenditure over revenue, will pass into the budget, and that any fresh Capital required, whether raised by special mining stock or otherwise, will be provided by the State. At the same time, the general financial management must be in the hands of the Mining Council.

31. Both the Mining Council and the proposed House of Commons Committee are often criticised on the ground that they undermine "Ministerial responsibility." May I respectfully record my conviction that, under existing conditions, "Ministerial responsibility is mostly moonshine?"

Reasons for National Ownership.

32. The objections brought against national ownership are usually for the most part objections to bureaucratic control. The above considerations, which presuppose national ownership, show that there is no necessary connection between it and bureaucratic control.

33. National ownership of the mines is necessary for three principal reasons; (1) for the sake of the community in order to secure the fullest utilisation and conservation of a vital natural product in the common interest; (2) for the sake of the consumer,

in order to prevent exploitation and profiteering; (3) in order to give the workers the sense of working for the community, and not for the benefit of any private person.

34. Full utilisation and conservation of our coal resources can only be secured by unified working, and real unification of working can only be secured by unified ownership.

35. This only leaves the two alternatives of a gigantic private Trust or monopoly (either under public control or otherwise) or of national ownership.

36. A Coal Trust not under public control is obviously out of the question.

37. War-time experience of State control without ownership has proved the impossibility of either effective or efficient control without ownership. Control without ownership involves huge waste by the duplication of administrative machinery.

38. Moreover, in controlling prices without ownership the State continually falls between the two stools of cheapness and plenty. If it restricts prices, output is restricted; if it fosters output, it can only do so by permitting high prices. The retention of the motive of profit-making as the incentive in industry renders efficient State control impossible.

39. In addition, the full co-operation of the workers by hand and brain can only be secured if they feel that they are working, not for private profit, but for the benefit of the community. Just as national ownership is inadequate without workers' control, so workers' control is inadequate without national ownership.

40. It has been suggested that the full co-operation of the workers could be secured by a system of joint control between owners and workers. But real control by the workers is impossible as long as the industry continues to be conducted for the private profit of the owners alone.

41. Where this is recognised, it is sometimes suggested that the workers might be given, in law or in fact, a share in the ownership by some system of individual or collective profit-sharing or co-partnership.

42. In my opinion, this would not work in practice, because the motives of the owners and workers are irreconcilable within the system of private ownership.

43. Even if it could be brought into operation, its effects would be anti-social; for the profit-making

2 May, 1919.]

MR. GEORGE DOUGLAS HOWARD COLE.

[Continued.]

motive is not improved merely by increasing the number of shareholders. The coal industry requires to be worked as a national service, free from the motive of profit-making.

44. In any case, it is hardly necessary to discuss this suggestion in detail; for it would certainly be rejected by the miners, and, as it has only been devised in the hope of making possible the continuance of private ownership, it would thereby fall at once, if it has not already fallen, to the ground.

Expropriation and Compensation.

45. I do not desire to enter at all fully into this aspect of the question, on which I am not an expert.

46. I desire, however, to emphasise my view that it would be wrong to compensate the owners of mines or minerals on the basis of their past or present commercial value.

47. My reason is, that this value depends upon the control which they have hitherto been able to exercise over labour. To the extent to which they have lost this control, the commercial value of their property has become unreal, and they have no title to compensation in respect of such value. They must not be placed by compensation in a more secure or more favourable position than other capitalists, who are also losing their control over labour on which their past profits have depended.

Methods of Control.

48. As I have stated, I am in general agreement with the Scheme of Control put forward by Mr. Straker on March 14th. There are only two points which I desire to elaborate further at the present stage.

49. The first point concerns the position of professional, technical and supervisory staffs. The members of these staffs can be roughly divided into two classes:—(a) those whose function is mainly expert and (b) those whose function is mainly the supervision or direction of other men.

50. In the case of class (a), the principle of selection must be primarily based on "qualification" and expert knowledge. In the case of class (b) it must be based primarily on personality.

51. I hold strongly that those men whose business it is mainly to direct others should be chosen by those whom it is their business to direct, either by ballot or through a Committee of Selection or a Trade Union.

52. Where persons whose function is mainly directive must also possess technical or professional qualifications, the range of choice should be restricted to persons possessing the necessary qualifications; but the principle of selection from below should be preserved.

53. There is not the same reason for the adoption of this course in the case of persons whose function is mainly or exclusively expert and advisory.

54. The second point concerns the question of centralisation and local initiative in control. I hold strongly that the full co-operation of the workers can only be enlisted by a system of control which is largely localised, and includes a considerable element of direct control by the workers in each particular pit. A system of joint control nationally, or even nationally and in the proposed districts, will not be effective unless it is combined with a system of pit control.

55. At the same time, pit control will probably not at the beginning be capable of such full establishment as national and district control. It is therefore of the greatest importance that the system of control first established should be such as to admit of an increasing element of devolution both from the Mining Council to the district and from both to the pit.

CONCLUSION.

56. In conclusion, I desire to emphasise my agreement with the words of paragraph XV of the Interim Report signed by the Chairman and by three other

members of the Commission, that "it is in the interests of the country that the colliery workers shall in the future have an effective voice in the direction of the mine. For generations the colliery workers have been educated socially and technically. The result is a great national asset. Why not use it?"

I believe that these words can only be made good in fact by the adoption of national ownership combined with some such system of control as that which Mr. Straker outlined to the Commission.

NOTE ON HOUSING.

In paragraph XXII of the Interim Report signed by the Chairman and three other members of the Commission, it is contemplated that a levy of 1d. per ton on coal raised might be collected and "applied to improve the housing and amenities of each particular colliery district." The recognition of miners' housing as a public responsibility is satisfactory, but I am not convinced that the method proposed for raising the fund is the best available, since it seems to contemplate direct payment by the consumer as an addition to price. I suggest instead that:—

(a) while royalties continue, the 1d. per ton, or whatever higher sum may be necessary, should be levied as a tax on the royalty; and

(b) when royalties are nationalised, (1) if any compensation is paid, it should not include compensation for the proportion of the royalties absorbed, or liable to absorption, by such a levy, a corresponding sum being placed instead to the credit of the housing funds; or (2) if no compensation is paid, the annual charge now represented by royalties should be transferred, in whole or in part, as may be necessary, to the housing fund."

13,118. *Mr. R. H. Tawney*: I think you have made a special study of trade unionism, have you not, and that you have written books about it?—Yes.

13,119. You are also secretary, I think, of the workers' side of the Industrial Conference?—Yes.

13,120. Since the most important condition of prosperity in any industry is the attitude and temper of the workers, your knowledge of their feelings and aspirations qualifies you specially to express an opinion about the proper organisation of the industry?—It is very kind of you to say so.

13,121. I know you are too modest to say it yourself. You deal first of all with what you call the wage system. I think you suggest it has broken down. Would it be true to say that the present demands of the workers go far beyond the old questions of hours and wages and material conditions?—Certainly. I think for the last few years especially it has been a very noticeable feature of labour disputes that they have been tending to centre far more round questions not of wages and hours but questions which involve discipline and management and other things which have been previously regarded as falling outside the scope of collective negotiation by trade unions. That is an increasing tendency, and of course it is increasing more and more as labour becomes more organised and more conscious of its own strength.

13,122. That is to say, present grievances are not merely material grievances?—No. I should say that although material grievances are not becoming less, the element represented by material grievances is becoming proportionately less all the time.

13,123. And their present demands are not merely for greater opportunity or more money, but for a change of status?—I think the fundamental unrest which has spread through industry does not rest on those factors alone, but rests on the worker's feeling that his position under the capitalist system is an unjust position.

13,124. In fact the workers' demand is a moral demand?—Yes.

13,125. Might I say they are finding their own souls?—Gradually.

2 May, 1919.]

Mr. GEORGE DOUGLAS HOWARD COLE.

[Continued.]

13,126. And in the present commercial system that is extremely inconvenient?—Yes, for the commercial system.

13,127. I think it would be true to say, would it not, that there was also a slightly different attitude among employers? For example, you are familiar with the proposals which are put forward for industrial councils or for profit-sharing. Could you tell us what you think about those?—Those are two rather separate groups of proposals, but the Industrial Councils proposal—that is to say, the Whitley Report proposal—and others of a similar tenor are, I think, really, in the minds of those employers who have taken them up, mainly methods of getting round this demand of labour for an increased element of control without really giving anything up, and the Industrial Council proposal is merely a proposal for placing on a rather broader basis the existing machinery for collective negotiation, but it is not a proposal for giving any real power to the workers. So far as I understand, it is not proposed that the Industrial Councils should take over any actual function or management. Whether it is nominally so or not, it remains a purely advisory body, and if you reach a deadlock on an Industrial Council, there is no power beyond the power of the workers to implement its decision.

13,128. And your view therefore is that these other things may be very nice and a sign of goodwill, but they are not of very much importance to the workers except as a stepping stone to something more?—I think that the Whitley Report may be a certain amount of use to some of the less organised trades, but broadly speaking I do not think the Whitley Report is a document of any considerable importance. With regard to profit-sharing—I did not answer that point when you put it—I think profit-sharing schemes are also of very little importance indeed. They are generally only produced in order either to stem some amount of unrest among the workers, or else to prevent unrest arising, and they do not, so far as I have studied profit-sharing schemes in operation, provide any real element of control, or even give the worker any share in the profits which is worth talking about.

13,129. It is suggested that they sometimes offer greater incentives to the worker?—Yes. Profit-sharing schemes have been put forward as a substitute for payment by results. If that is the object of the profit-sharing scheme, I think it is extremely unlikely to produce it.

13,130. The workers will produce more to get some of it back?—Yes. It is an alternative to piecework.

13,131. Is it a case of feeding the dog on its own tail?—Yes; it all comes out of the product of labour.

13,132. Have you seen any plan under a private system of ownership which could be supposed to reconcile workers and employers?—I can conceive a reconciliation up to a certain point of purely material interests of the workers and employers of a particular industry. I can conceive that coming about only by an immoral conspiracy against the public on the part of workers and employers. I do not believe any big organised group of workers is likely to go in for such a partnership.

13,133. And do you think, if it occurred, it would be inischievous?—Yes.

13,134. But on the whole you think it is not likely to occur?—That is so, in any big industry.

13,135. If it does not occur, then the alternative is the continuance of industrial war?—Yes, or the finding of some other solution.

13,136. Why is it impossible to find any stable solution under private ownership?—I think it is because the motive of profit to individuals, which is the guiding motive of industrial organisation at present, is irreconcilable with the aspiration on the part of a great proportion of the people in industry, including many employers, managers and workers, which is an inspiration to serve the public. You cannot obey that motive of public service with the motive of profit-making.

13,137. That is to say, in private industry the workers tend more and more to feel that they are

used as instruments of production for the convenience or profit of the individual employer?—Yes, and still more that they are being used for the convenience and profit of a system. It is not the individual employer, but the system as a whole.

13,138. And what they aspire to is to be the servants of the public serving it directly?—Yes, and serving it freely.

13,139. Now you pass certain interesting criticisms on some schemes of nationalisation which are put forward. You say that mere nationalisation, or mere public ownership, or public administration, although it is a condition of finding a solution, is not in itself a solution. What you suggest by way of supplement is what may be called self-government in industry, is it not?—Yes.

13,140. And the first advantage you see in that is industrial freedom. Could you explain more fully what you mean by industrial freedom?—The meaning of political freedom is fairly well understood. We understand broadly what we mean when we talk about political democracy and a man being a citizen of a free society. I do not mean that there are such societies or that men are free politically, but we understand what we mean when we talk about it. The principles which we talk about when we talk of political democracy apply just as much to the organisation of an economic system as they do to the political system. I feel that a man ought to be a free citizen in the industrial commonwealth as in the political commonwealth.

13,141. In what sense is he not free in industry?—In the sense I tried to indicate, that the theory of the wage system is that in return for a certain amount of money he sells his labour power, and in doing that surrenders his right to control the way in which that labour power is used and the right to possess the product of his own labour. I do not mean that that works perfectly in practice, but that is the theory and the guiding principle.

13,142. That is to say, in so far as the power of the system is not restrained by trade unionism, the individual workman really lives at the will of a master, and his livelihood depends upon his caprice?—There again it is not only the individual master, but also the whole system of masters.

13,143. That is to say, if he is an agitator, he may be dismissed?—Yes, and blacklisted.

13,144. He may find piece-rates arranged and re-arranged for no reason which he can understand?—He constantly finds piece-prices adjusted against him.

13,145. He may be compelled to work overtime irrespective of his health?—Yes, and the weaker the trade union the more likely that that sort of oppression occurs.

13,146. And your view is that that kind of oppression is the cause of the revolt which is now taking place?—I would not put it in that negative sense. It is one cause—the final positive cause is the aspiration of men towards freedom.

13,147. Supposing you could secure freedom, by which I understand you mean corporate control of men over the conditions of industry?—Yes.

13,148. Supposing you could secure that, it would mean in effect devolving much greater responsibility upon the men?—Yes, it makes much bigger demands upon the man than the present system.

13,149. What do you think would be the effect of that upon production?—Do you mean the immediate, middle, or ultimate effect.

13,150. All?—I think the ultimate effect would undoubtedly be entirely beneficial. I think the waste involved in the absence or any motive of service on the part of the mass of people is incredible. It is an enormous waste which we incur every day. The immediate effect I think would not be diminution in output. Whether it would be an immediate increase in output I am not able to say. You have to allow a certain period of trial for a system to find its feet. It would greatly depend upon the spirit in which it was evolved and the competence of the people working it.

2 May, 1919.]

MR. GEORGE DOUGLAS HOWARD COLE.

[Continued.]

13,151. We have heard something about "the Government stroke," as it is called. Do you think under private industry we do in effect secure the best energies of the workman now?—No, certainly not; it would be a very curious thing if we did.

13,152. Have you known cases in which, owing to the fact that piece-rates would be reduced if workmen earned more, an incentive to reduction in output was given in private industry?—I think that incentive is present in an enormous mass of private establishments.

13,153. Therefore it is a mistake to talk as though the present private establishments were an economical system?—I think it is a wasteful system, and the biggest waste is the waste of human motive.

13,154. Where any large proportion engaged in an industry feel a perpetual injustice, does that produce great inefficiency in the system?—Where there is continual friction between the different parties there is bound to be an inefficient system.

13,155. What you propose to substitute is the discipline of good will for the discipline of fear?—Yes—discipline by an organisation in which you are conscious of your own citizenship in the community.

13,156. You are familiar with the objections which are brought against proposals of that kind. Has it ever occurred to you to compare them with the objections which used to be brought against political democracy?—I think they are very much the same. They are primarily directed not to a proof, but to an assertion that the ordinary man is not competent to exercise power; and, secondly, to an assertion that he does not want to exercise power. That accusation was constantly made against political democracy, and is still made. It is now being made against economical democracy in exactly the same way.

13,157. And, on the whole, political democracy has not produced the social catastrophes which were anticipated?—I do not believe so. I think M. Faguet has written a book on democracy which is very valuable.

13,158. He is a brilliant and interesting writer whose voice is calling in the wilderness?—Yes. It is a very pleasant voice in an unpleasant wilderness.

13,159. You think nevertheless the world proceeds steadily towards democracy?—Yes, steadily, and also by jerks.

13,160. Do you think, if this experiment were made, there is any reason to anticipate a catastrophe such as used to be foretold with regard to other progressive movements?—No, but I think there is a reason to anticipate catastrophe if you do not proceed in this direction.

13,161. That is to say, if the system is to work, it must be with good will and general assent behind it?—Yes.

13,162. And that is at present what it has not got?—No, and it is losing it all the time. It never had it completely, and it is losing it every day.

13,163. To the ordinary workman it would be true to say, would it not, that the economic and social tyranny of the workshop is a much greater grievance than the tyranny of a distant Government has been in the past?—Yes, he feels it much more nearly; it affects him in his everyday life.

13,164. With regard to your proposals as to management, you do not propose, I presume, to supersede the existing technical experts and persons of experience who now conduct the industry?—No, I think their assistance is of the utmost importance. I tried to point out that I think that assistance can be procured just as well under the system which I have suggested as under the present system, and probably better.

13,165. That is to say, there is no question of sweeping away existing staffs?—No, so far as they are adequate or expert staffs.

13,166. But you would employ them in rather different relations in the framework?—Yes, and give them, as well as the manual workers, a much greater amount of interest as workers.

13,167. You suggest, on page 3, that some managers ought to be recruited by election. Have you any proposal to secure that such election does not result in persons without the necessary expert qualifications being chosen?—There are two points there. In the

first place, I suggest, in paragraph 52, where you are dealing with people requiring technical qualifications, that they should be restricted to persons possessing those qualifications. The second point is that I believe if you place the choice of their supervisors in the hands of the workers, whilst you would undoubtedly have a certain amount of mistakes at the beginning, and a certain number of wrong people selected at the start, yet I believe people would very soon get tired of selecting idiots to supervise them. In my own experience, I know of nothing more aggravating than being supervised by an idiot.

13,168. Granting there is the danger which you allege of selecting persons without the necessary qualification, do you not think that the men who are doing a job are very often the best judges of men to organise and lead them?—Yes, as soon as they have got out of the idea of existing antagonism between them and the management, they become the best people to do the selection. The only question is whether during the transition from the present system some will not be guided by the feeling that the management is not "up agin" them, and they will want people who will be easy with them.

13,169. And this period of transition has already begun. Is it not the case that foremen are increasingly nominated by trade unions?—Indirectly. I do not think there are cases in which the foremen are actually appointed by the trade unions in the strict sense. There are cases, I believe, in which something very like that prevails. Of course the extent to which trade unions exercise an amount of control over the selection of foremen negatively by veto is increasing very fast.

13,170. Is there any reason to believe that foremen who are appointed in such a way with some reference to the desires of the men whom they have to control and govern are less efficient?—The only case I can call to mind is one of the most efficiently organised factories I know.

13,171. Will you explain more fully what you think would be the relation between the management and the Pit Committee in the case of mining? It is sometimes suggested this would involve a confusion of responsibility or destruction of responsibility, and that you would have a committee of busybodies interfering with every detail. Do you think there is any real danger of that?—Not if you have a sensible system of organisation. Of course, if you had your Pit Committee absolutely unco-ordinated by district or national machinery, and merely set up a system of pit control with nothing else, I think that would be a very real argument; but I suggest that point is very largely met by the relation between the Pit Committee and the district body, and also secondarily by the connection between the district body and the national body, and I say where you get a difficulty arising you meet that point by an appeal to the district body and you settle it in that way.

13,172. *Chairman:* Would you make the district body final or that everything should go to the national body?—I would not say everything should go to the national body. I think you would come to questions of principle which would have to go to the national body. I should be in favour, as far as possible, of making the district body final on all questions other than questions of principle.

13,173. *Mr. R. H. Tawney:* Would it be a fair analogy to what you propose to take the relation at present existing between the manager and the Board of Directors, which is after all, if it is not profane to say so, nothing more elevated than a committee: the Board of Directors leaves him considerable discretion in certain cases, and the committee would leave similar discretion?—The difference is that the Pit Committee knows probably a good deal more about it than the Board of Directors.

13,174. If interference takes place, it would be the interference of knowledge instead of the interference of ignorance?—Yes, or the interference of the knowledge of the industry instead of the knowledge of making profits.

13,175. You speak towards the end of your paper of compensation. You say that the value of the

2 May, 1919.]

MR. GEORGE DOUGLAS HOWARD COLE.

[Continued.]

property of those who now own it in the mining industry depends largely upon the implicit assumption that they will continue to control the services of labour, and that, as that assumption is weakened by the growth of a vigorous trade unionism, so the value of that property diminishes?—Yes.

13,176. And you think it reasonable that, in fixing compensation, account should be taken of the fact not only that coal mines, as it is said, are a wasting asset, but this control over labour is a wasting asset?—That is so—that is assuming compensation at all.

13,177. That is to say, on your view changes are certain to take place. Would it be correct to say that you think that the present owners of property in the mining industry would be very lucky indeed to be bought out now, because later on they might be obliged to surrender control without being bought out at all?—Yes, I think there are two points there. In the first place, I think that they might be faced with complete confiscation at a later stage if they are not bought out now; in the second place, I think the circumstances of the moment—especially the Parliamentary circumstances of the moment—are far more favourable to them from the point of view of securing unduly high compensation than the circumstances of any subsequent Parliament are likely to be.

13,178. Does what you say under that head apply still more to royalties?—Yes, I think it does.

13,179. Royalties being already liable to taxation which is likely to increase?—Yes, and royalties being more popular for taxation than ordinary capital.

13,180. So that what you really think ought to be done would be to offer a kind of solatium to vested interests and not to pay the full market prices as compensation?—Yes, that is roughly my suggestion. I do not want to be too definite about it, but one suggestion I might make very tentatively indeed is that in any compensation in Government stock so paid to the owners, there ought to be some clause enabling the stock, or a proportion of it, to be resumed by the Government without compensation in the event of confiscatory measures being introduced in other industries. What I mean is, supposing you compensate the mine owners at the present stage with certain Government stock, and then you proceed to the nationalisation of some other industry—say the shipyards—by that time you will have moved on so that the terms of compensation granted to the shipbuilders will be less favourable than the terms originally granted to the mine owners. I should suggest that it would be practicable to insert in your terms of compensation some clause which would enable you on that occurring to cut down the rate of interest on the mine stock held by the mine owners.

13,181. *Chairman*: Would that affect the price of stock at all?—It would, I presume.

13,182. *Mr. R. H. Tawney*: Do you see any prospect of anything approaching a final settlement of the kind of questions which has been agitating the mining industry for the last 10 or 20 years short of nationalisation and some scheme of administration and government by the workers in the industry?—I think the real position you are up against is something like this: that you have the choice between carrying on with the present system until you reach the stage where that system breaks down altogether and you have a period of chaos and a very difficult task of reconstruction indeed, and the alternative of taking time by the forelock and trying an experiment, so far as you can, in the creation by this new system of nationalisation and trying to avoid any sharp break and period of chaos.

13,183. Do you think that not only the course of justice to the workers, but the course of social prudence is not to wait until catastrophe occurs but to forestall it?—Certainly.

13,184. *Mr. Frank Hodges*: Apart from the question of trade unionism as it affects manual workers, have you made any study of trade unionism as it affects the managerial staffs in the mining industry?—In the mining industry very little. I have made a good deal of study of the general question of the organisation of supervisors, managers and workers in

industry generally, but I do not know very much about mining organisation.

13,185. Are you aware of the existence of a trade union among the managerial staffs in the mining industry?—I know there is a Mine Managers' Association and an Under Managers' Association.

13,186. What would be the kind of objects of such trade unions?—It would have presumably two distinct kinds of objects: one would be the safeguarding of the material and economic interests of the members, and the other would be the pecuniary community of interest among the particular grade of persons. That might be done through the same association. It is more often, I think, in the mining industry done through separate associations. Either of those forms of association might develop, and I think both have, to a certain extent, developed a third form of activity, which is the desire for control which you have on the part of managers, and which has developed from the economic bond, or you might have it develop out of the pecuniary bond, or both, of course.

13,187. Would such an association also be a symptom of a certain form of industrial unrest?—Yes. I think during the last few years unrest among managers has become a very considerable factor.

13,188. Have you ascertained whether there is any growth of antagonism between managers and shareholders or directors?—I would not like to say that for the mining industry, but certainly for other industries, and especially for the engineering industry: the managerial staffs are tending more and more to organise along trade union lines and include the demand for greater professional control in their programmes.

13,189. Are not you aware of the fact that a few weeks ago a strike was on the point of occurring among certain officials in the South Wales coalfield?—Yes, I know the Colliery Officials' Society sent in strike notices.

13,190. So that, in re-casting this industry, due regard would have to be paid to those symptoms of industrial unrest existing among the managerial staffs?—I want them to have a very considerable share in the government of the industry along with the manual workers, and I believe the ultimate solution is a system of government which will include the managerial element along with the clerical and manual elements.

13,191. Already, I believe, certain movements are growing in that direction?—Certainly.

13,192. Are you aware that already there has been an affiliation between what is regarded as a very revolutionary trade union—the South Wales Miners' Federation—and a group of officials known as the South Wales Colliery Officials' Union?—I did not know it had gone as far as that. I knew they were working together to a certain extent, and, of course, if you go a step further, you find the Miners' Associations include a very high proportion of the deputies already in their ranks.

13,193. Would it surprise you to learn that the deputies too have evinced symptoms of industrial unrest during the last two or three years of a very marked character?—Not in the least. I have come across it.

13,194. Are you aware of a strike of deputies in the year 1917 throughout the whole of the South Wales coalfield?—I remember it very faintly. I do not remember the details.

13,195. Would you suggest, or have you sufficient information to come to a conclusion, that both manual workers and technical or managerial workers are growing in their opposition to private ownership in industry?—I think that is undoubtedly so, and I think that the prospects of an alliance between the manual and the managerial worker are very much brighter at the present moment than ever before. I think that the managerial staffs are beginning to realise that their interest really lies with the manual workers and not with the owners of capital.

13,196. Is it in the hope of that developing that you pin your faith to the practical operation of your system of control?—Yes, certainly. I only suggest this system and I only approve of Mr. Straker's system as what you may call a half-way

2 May, 1919.]

MR. GEORGE DOUGLAS HOWARD COLE.

[Continued.]

house. I want to see a very much more complete system of self-government develop in the mining industry, but I do not think that can develop completely until you have a fusion of feeling between the managerial and the manual working elements. I believe under national ownership that fusion will develop very rapidly indeed.

13,197. Turning to profit-sharing schemes which may represent a different system to the existing system in the mining industry in which there is no profit-sharing at present, would you suggest that a profit-sharing scheme between the miners and mine owners would result in a conspiracy against the community?—Assuming that the miners agreed to such a scheme and worked such a scheme in the spirit in which they were true to capitalist principles, the consumers would have to look out.

13,198. That is to say, under a profit-sharing scheme you have this motive, the creation of the greatest possible profit in connection with the creation of the highest possible wages?—That is so. To give the workman a financial incentive to keep up the prices of coal against the consumer.

13,199. And the consumer would suffer?—Yes, the consumer would suffer.

13,200. Do you think on the other hand that with this growth of antagonism, this almost proved growth of antagonism on the part of the managerial staff, the under officials and the manual workers, that any system of trustification or unification of industries under capitalist trust would tend towards increased productivity of the industry and smooth working in the future?—I do not think it would tend towards smooth working. I think it would intensify the antagonism. If it did not tend towards smooth working it would be extremely unlikely to lead to increase of output. I think also that the capitalist trust in mining industries would in many cases lead to a concerted policy of restriction of output. That is the experience of trust organisations in the past. It is the case that if the miners restrict output the capitalists certainly restrict output just as much.

13,201. Is that your experience of trusts on a big scale in other countries, America, for example?—You cannot generalise about trusts in that way. A good many trust organisations, or rather cartel organisations, have been built up almost entirely on the principle of limitation of output.

13,202. I am particularly interested in your scheme of control here. I should like to ask you one question about it. To what degree would you entrust control to the workman in the initial stages of this scheme?—That is a very difficult question to answer. I want to know what the workman is. It at once raises the question of the amount of the national control, district-control and pit control. If you will put it in compartments I will try and answer it.

13,203. Start from the top. Can it be assumed there is sufficient intelligence in the country, both on the technical side and the administrative side, to control the industry in its national aspect?—I think so. I think you want, of course, in any re-organisation of the mining industry the very best technical advice you can get. The technician begins by improving the organisation of the industry, and applies science to it. I think we can get better organisation in connection with some systems of control than others, and the leaders of the Miners' Federation are probably capable of playing the necessary part under the scheme in the utilisation of scientific experience of the coal industry on its technical side.

13,204. Would you think men are sufficiently intelligently equipped in the districts to efficiently administer the industry in the separate districts?—I do not know about every district. So far as some of the districts that I know of are concerned I have no doubt at all they are sufficiently equipped. I have no doubt they are sufficiently equipped in Lanarkshire, and I have no doubt they are sufficiently equipped in Northumberland and Durham. Those are the districts I know best. I should say the same is true of any large district. What the position is in some little coalfield in the Midlands I cannot tell you.

13,205. Are you afraid, assuming you are satisfied that the ability exists to run the industry in its

national and district aspects, that the workmen who would embrace the managerial staff are at this stage competent to do what, after all, is the effective thing, conduct the production of the commodity?—That is the pit control you are dealing with. I think in the pit you have this problem to face that pit control will be more difficult to develop immediately in its full sense than either district or national control, because if you are going for a system of unification you will have, whilst you are bringing that system about, to secure a certain amount of uniformity and you will have to avoid experiments which are outside the sphere of your policy of unifications and also because it is always more difficult to make several thousand experiments at once than one or a dozen experiments; they are more difficult to keep in hand. At the same time I think in the complete working of the scheme the pit control is really the pivot on which the whole thing turns. I mean the real problem you are up against is the problem of getting the ordinary working miners really interested in the industry, and the thing you have above everything else to develop is the element of pit control. It will probably grow more slowly. I want to see a progressive amount of decentralisation as the scheme gets into working order.

13,206. The success of the pit committee depends upon the degree to which the workmen are prepared to accept responsibility?—Yes, that is so, and you can even see that to a certain extent in the working of the pit committees despite their limited powers during the war. In districts where the pit committee has been restricted to absenteeism it has been useless. When it has taken other functions into its hands it has for a time in certain districts been a very great success. I might mention certain Derbyshire collieries. What has generally happened has been that owners who are anxious for the pit committee to deal with absenteeism have been equally anxious to shut it down when it has shown a tendency to take a real active life. I think the experience of pit committees is very encouraging.

13,207. Are you aware that certain pit committees in certain districts made application to share in some small degree in production and that was refused?—I know that happened in certain cases.

13,208. That increased the bitterness then existing between the workman and the capitalist?—Yes.

13,209. You think the sense of responsibility will grow in stages; it cannot be assumed all at once?—If you move a man into a comparatively rotten system and compel him to work there for the greater part of his life and then take him out and put him into a healthy environment you cannot expect him to adapt himself to the healthy environment all at once. It takes time to get rid of the effect of the bad system.

13,210. Have you arrived at this point of view that unless industry is prepared to adapt itself to giving, taking the long view, complete responsibility and control to the producers of industry that industry is likely to break down?—My view is that unless big steps of re-adjustment are taken on the lines suggested you will have eventually a catastrophe in your industry, and that is to be avoided, if it can be avoided. I am avoiding committing myself to your actual wording there.

13,211. *Sir Allan Smith*: May I ask you what becomes of the employer in this scheme of yours?—That depends upon what sort of person the employer is.

13,212. The individual who is presently called the employer?—That depends upon his competence. If he is a competent man, I hope he will get a job in some managerial capacity; if not he may have to work as a coal heaver.

13,213. I assume that applies to all industries as much as coal?—Not in the same immediate sense as in the coal industry. In many industries the workers have not reached the same stage of organisation and the industry is not to the same extent ripe for adopting the measures suggested. I assume the scheme is working by stages, and different stages in different industries.

13,214. Do you anticipate the possibility of it taking place in shipyards?—I think in shipyards it will come very soon; it is one of the riper industries.

2 May, 1919.]

MR. GEORGE DOUGLAS HOWARD COLE.

[Continued.]

13,215. Do you suggest it can take place in all industries in the Kingdom?—I would not say that exactly. I suggest that all industries which have at present any form of capitalist organisation must ultimately pass into national ownership.

13,216. All manufactories, we may take it, are proper subjects for nationalisation?—Ultimately, yes—national ownership.

13,217. That eliminates all question of employers?—*Qua* employers, yes.

13,218. What about capital?—Could you particularise that rather more?

13,219. What is going to become of capital? You refer to a capitalistic system, you eliminate that system and substitute a national one. What is to become of the capital at present involved in the system?—That capital instead of being the asset of the private individual becomes an asset of the community.

13,220. At the moment I assume you agree that capital belongs to the shareholders?—Under a social convention it is allowed to be treated as belonging to them.

13,221. Accepting the conventions as we find them—capital belongs to the shareholders?—I think if I answered yes I should be recognising the right of shareholders to the capital.

13,222. Do not trouble about rights. The fact at present is the shareholders are the owners of the property?—Yes, legally.

13,223. If you expropriate these shareholders then it means you may expropriate some of the shareholders who are the working class?—Yes.

13,224. Do you think they should be subjected to that expropriation?—I have never suggested that you should completely take away all the property at present in the hands of any individual person. I do suggest if a workman owns a share in a cotton factory, say, he should cease to own that share and the cotton factory should become the property of the community.

13,225. What becomes of the amount, the value of the share which this man has taken away?—That raises the whole question of compensation. I do not recognise the right to compensation. I do recognise it is necessary to allow some form of what you may call compensation.

13,226. You believe in the right to live, I suppose, and the right to work, and the right to save, if that is possible?—That is a very big phrase. The right to save is admissible.

13,227. Suppose you were not to spend all the money that is paid to you, I assume that is saving?—Yes.

13,228. Are you to continue to have that right?—The right to save at present involves the right to receive interest in saving. If I accept the right to save I am not necessarily accepting the right to interest as a right to save.

13,229. You are not necessarily accepting the right to invest your savings?—Not investing for financial gain.

13,230. You would invest them with no interest?—You would place them in a bank which is not paying interest.

13,231. You lend to the bank, do you not?—They are to be nationalised.

13,232. They are to be nationalised, I forgot. You say they are to be suppressed by an edict. Have you ever supervised?—I cannot say I have directly supervised; I have worked with people.

13,233. You cannot imagine his feeling under such a dictum as you have given here?—I will do my best.

13,234. With regard to the question of the Industrial Council, do you seriously suggest that the Industrial Councils proposals are not sound?—The Whitley proposals?

13,235. No; the Industrial Council proposals?—I did not say that. When I spoke of Industrial Councils I spoke of the Whitley proposals.

13,236. You said you are secretary of the labour side of the Industrial Council?—Yes.

13,237. You criticised this proposal in the same way as you criticise the Whitley Council's scheme?—I

think not. I was not asked questions about this proposal. I think it was the proposal of the Whitley Committee.

13,238. You were asked whether the Whitley proposals were methods of getting round the claims of the workmen without dealing with them?—Yes.

13,239. And the Industrial Council proposals had the same effect?—I did not say that.

13,240. Do you differentiate between the two?—I think the reason why the Prime Minister called the Industrial Conference was that he was in a hole and he hoped to gain a certain amount of time by calling it, not expecting anything considerable to come out of it.

13,241. Have you considered the Joint Report that was signed? Do you suggest the report is of no use whatever?—I suggest the Industrial Council will not solve the industrial problem, and no joint body between employers and workers can solve it. It may be a useful piece of machinery; I think it is.

13,242. Do you contend there is such a feeling of antagonism between employers and employed as to make it hopeless to expect co-operation between the two?—I think there is such a feeling of antagonism between the two parties that any complete or efficient system of co-operation is now impossible. I think that difficulty will increase and not decrease.

13,243. Do you suggest it is impossible?—I said complete and efficient co-operation.

13,244. Do you suggest it is not in being?—It may be in being where the workers are not strong.

13,245. Do you suggest in many of the highly organised industries the relation between employer and employed is not satisfactory?—Yes.

13,246. Even in individual cases?—Do you mean do I suggest there are not any cases where it is not satisfactory?

13,247. Do you suggest that?—Taking the general relations between employers and workers in any big industry I say they are fundamentally thoroughly unsatisfactory. You may in any industry find individual employers getting on nicely with individual workmen. That is not the point. I am dealing with the general relations in the industry and their effect on the working of the industry as a whole.

13,248. You seriously suggest there is such a pull between the two parties to industry at the moment?—Yes.

13,249. You say the labour disputes are questions of discipline and management. Do you suggest that most of the strikes we have had during the war are against discipline of the Trade Unions?—I was referring to the fact that strikes more and more centred round the dismissal of particular persons and the sort of strikes that have arisen by some act committed by the management in the conduct of the business. The war circumstances were abnormal and brought in a number of new factors.

13,250. Are you referring to peace time or war time?—Some strikes on the railways before the war are a particular instance that comes into my mind.

13,251. No doubt you will get particular instances of almost everything. You suggest this case actually took place?—How do you mean?

13,252. That these disputes centred on questions of discipline and management?—I think they were tending more and more in that direction.

13,253. Were you intimately associated with labour matters prior to the war?—I was making the closest study I could of labour matters for years prior to the war.

13,254. You say the wage system must go. Do you suggest that persons should not receive wages?—That depends upon what you mean by wages.

13,255. May I suggest I do not propose to discuss it from that point of view. It is taking up time unnecessarily. You refer in paragraph 24 to the Mine Guild becoming possible. Are you a Guild Socialist?—Yes.

13,256. Have you framed your *précis* of evidence and are you giving your evidence now on the lines of the tenets of Guild Socialism?—I am not proposing a complete guild. I propose the immediate steps which seem to me to be practicable in the mining industry and which seem desirable on their merits, in

2 May, 1919.]

MR. GEORGE DOUGLAS HOWARD COLE.

[Continued.]

the belief that those steps will lead to the formation of a mining guild.

13,257. *Sir Arthur Duckham*: There are one or two questions I want to ask you. In paragraph 17 you say: "If a man must receive orders, he must, if he is to be free, feel that these orders come from himself or from some group of which he feels himself to be a part." Do the Trade Unionists obey the orders of the Trade Unions?—That depends, of course. I think the present strain on Trade Unionism in a good number of industries has meant that the leaders have got very much out of touch with the rank and file of the Trade Unions; there is that unavoidable tendency in large organisations unless it is corrected. I think a large re-organisation will have to come about. I think the adoption of the scheme of control will bring that about.

13,258. You do not agree with the present system of Trade Unions in that way. You think it could be improved?—Certainly, in nearly all industries.

13,259. You agree the trade unionist does not obey his Trade Union orders?—Not always.

13,260. Take the question of the consumer. Does it not seem to you that the coal is produced for the consumer and not for the sake of paying profits to the capitalist or recompense to the workpeople?—Certainly, yes.

13,261. Surely the consumer has really a very great interest in the coal produced?—Yes, the two people who seem to have the greatest interest in the coal are, first, the people who use it; secondly, the people who produce it under certain conditions.

13,262. You raised one point with regard to the steel industry. You do not say why the steel industry should be represented on the Council. Surely on your Council or whatever arrangement you made or organisation you made you would put a very strong representation of consumers on that Council?—I did not mean the steel industries would not be represented. I meant if you take the Iron and Steel Manufacturers' Association and put on a representative of that Association I should not regard him as representing the steel industry because there might be no representative of the Iron and Steel Trades Confederation.

13,263. You would agree general representation does come in?—Yes.

13,264. For instance the Sheffield municipality might represent all Sheffield?—I was rather attracted by Mr. Greenwood's suggestion of a consumers' council.

13,265. The other point is this. I agree with you the pit committee is a bit difficult to form and rule. I do not know whether you have ever worked under a chief or been a chief in control of workmen, either one or the other?—It all depends upon what you mean by workmen.

13,266. Take it in a factory. Have you ever worked as a factory hand or workman?—Thank Heaven! No.

13,267. Or worked as a foreman or manager?—I have never worked in an industrial enterprise.

13,268. A lot of us have to. The difficulty I see is this, if you have the workmen electing their foreman or their manager there is always the great difficulty of that man taking action; for instance, like our Members of Parliament, they may be controlled by what their voters want and not by what they think best. Would you not find the manager, or foreman, or whatever the man who was put in authority, would be controlled by what he would think the workman wanted best?—Up to a point that would be I think a good thing. I mean if you are going to have a group of men working together under a leader then that group of men will, I think, work most efficiently if their leader and themselves have a sort of common feeling and pull together properly.

13,269. If you have a perfectly good feeling it would work?—Yes.

13,270. What happens if the manager gives an instruction to a man and he does not obey it, or if his ideas are different to his committee?—You mean if a foreman—

13,271. Say the manager of a mine instructed a gang of workmen to do a bit of work and they did not do it?—It really comes down to a difference of opinion as between the Pit Committee and the mine manager?

13,272. Yes?—You have to provide for that by allowing an appeal to the district body.

13,273. Take this point: There was a likelihood of an accident in the pit; he tells a gang of men to do something to stop the accident. You cannot put that to the District Committee?—When it is a question of safety or necessarily immediate action is concerned, you have to give the mine manager the power to give the order.

13,274. You agree the mine manager should have power, and, if necessary, there should be an appeal against his decision later?—Yes, that is what I mean.

13,275. Something of that sort you have considered?—Yes. I would not give the mine manager the absolute power to give any order. I would try to make some limitation of the matters about which he should give orders. When the question of safety is involved, he ought to give orders.

13,276. You could not have daily arguments as to the orders the manager was to give?—That presupposes a system not in actual working. I think during the early stages of the working the mine manager should have power to give a good number of orders. As the system settles down the amount of discretion you have to leave in his power on non-vital matters will become less, and the Pit Committee will proceed to assume more authority.

13,277. They cannot issue orders?—I am not sure that the issuing of orders is such a very vital thing; they can take decisions, and possibly they pass those decisions on to the mine manager to act upon.

13,278. I have worked in various concerns of this sort that have committees and profit-sharing and that sort of thing. The great difficulty is this matter of responsibility for the orders at the time. Somebody has to be chief; somebody has to be captain of the ship. Do you agree there should be somebody who would be captain of the ship?—In that sense, yes. I certainly agree you must have some means of settling on the spot things that need settling.

13,279. It would never be done otherwise?—No.

13,280. You have not tried to run an executive by committee, I suppose?—Yes, I have had a good deal of experience in trying to run offices on those lines.

13,281. *Chairman*: Mr. Cole, you must come again on Tuesday. You have given interesting evidence with regard to some individual Pit Committees, I think you said, in Derbyshire which had a share in the direction and which have been a success. Could you bring with you on Tuesday the names of those Committees and tell us something about them? Obviously that is important to this enquiry?—It is difficult to do that for this reason. My knowledge of those Committees is based on discussions with the Derbyshire Miners' Association of those things happening. I do not know the names of the pits the various people are employed in. I only know what they told me. I can try to get it from the Derbyshire Miners' Association.

13,282. Then we may have to ask you to come back after Tuesday?—I will see what I can get, but I cannot promise it by Tuesday.

Chairman: If you cannot promise it by Tuesday we may have to call you again on Tuesday week if necessary. That piece of evidence is most important.

2 May, 1919.]

MR. GEORGE DOUGLAS HOWARD COLE.

[Continued.]

SECOND STAGE—SEVENTH DAY.

TUESDAY, 6TH MAY, 1919.

PRESENT:

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. R. W. COOPER.

SIR ARTHUR DUCKHAM.

MR. FRANK HODGES.

SIR LEO CHIOZZA MONEY.

MR. ROBERT SMILLIE.

SIR ALLAN M. SMITH.

MR. HERBERT SMITH.

MR. R. H. TAWNEY.

MR. SIDNEY WEBB.

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE (*Assessor*).MR. ARNOLD D. McNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

Chairman: Gentleman, I very much regret to say that I have had a letter from Mr. Forgie, one of our colleagues, stating that he has been unfortunately obliged to resign his position on the Commission. He states that in the interests of his health he is compelled to come to this decision, and that his medical adviser is imperative that he should at once take a long rest from active work. He says that he desires to render to the members of the Commission his sincere and heartfelt thanks for the unvarying kindness, courtesy and consideration which they have extended to him at all times, and wishes us every success in our work. I am sure you will wish me to convey to him our regret that he is no longer able to assist us and our hopes for his speedy recovery from what I hope is only a temporary ailment.

Then I have had this morning a letter from the Minister of Labour, Sir Richard Horne, which is in these terms: "Dear Mr. Justice Sankey, Mr. Forgie has intimated to me that owing to ill-health he is unable to continue to act as a member of the Commission on the Coal Industry. I have now to inform you that the King has been pleased to appoint Sir Adam Nimmo, K.B.E., to act as a Commissioner in his place." I think we shall have the pleasure of seeing Sir Adam Nimmo to-day and welcoming him as one of our members.

Mr. Evan Williams: Sir, before you take the evidence, on Friday I asked for a return of the expenses of the Coal Controller's Office. I should like to go a little further into this, and ask for a return as to the number of persons employed or engaged in the work of the Coal Controliership in all its Departments, both in London and the country, and the number of those who have done their work either freely and without any charge or for a nominal charge.

Chairman: Certainly.

Sir L. Chiozza Money: Sir, could there be added, for the elucidation of those figures, the description of the work performed by the various classes of persons, because it may have relevance to the question of nationalisation.

Chairman: Yes, we will get full information as to that.

Mr. Arthur Balfour: May I ask for the report of the American Commission on the question of trusts, which was referred to on Friday? I think it is important to see what conclusions were drawn by the Commission.

Chairman: Yes, we will get it.

Sir L. Chiozza Money: And might I suggest that we have the report of the American Conservation Committee?

Chairman: Certainly; we will try and get it.

MR. GEORGE DOUGLAS HOWARD COLE, Recalled.

13,283. *Chairman:* At the conclusion of your evidence on Friday I said to you: "You have given interesting evidence with regard to some individual Pit Committees. I think you said, in Derbyshire, which had a share in the direction and which have been a success. Could you bring with you on Tuesday the names of those Committees and tell us something about them? Obviously that is important to this enquiry.—(A.) It is difficult to do that for this reason. My knowledge of those Committees is based on discussions with the Derbyshire Miners' Association of those things happening. I do not know the names of the pits the various people are employed in. I only know what they told me. I can try to get

it from the Derbyshire Miners' Association. (Q.) Then we may have to ask you to come back after Tuesday.—(A.) I will see what I can get, but I cannot promise it by Tuesday." Have you been able to do anything in regard to that matter yet?—I have communicated with the Derbyshire Miners' Association, and they are getting information, but it has not yet arrived, I am sorry to say.

Chairman: Then we will call you at a later stage with regard to that.

13,284. *Mr. R. W. Cooper (to the Witness):* On Friday, in answer to Sir Allan Smith, you described yourself as a Guild Socialist, and you also referred to

6 May, 1919.]

MR. GEORGE DOUGLAS HOWARD COLE.

[Continued.]

something called a Miners' Guild. I hope you will excuse my ignorance, but will you explain what a Guild Socialist is?—Guild Socialism is the name of a school of thought which holds that it is necessary that public ownership should be assumed over the various industries. It holds at the same time that the right way of administering these industries is not through bureaucratic State departments, but through associations which we call Guilds, including the whole necessary working personnel of each industry; that is to say, including not only the manual working elements, but including also the managerial elements, and in fact every person who is necessary to the complete carrying on of the industry or service.

13,285. Who are the owners of what I may call "the undertaking" or what I call "the property"? Perhaps you may quarrel with the word. Who are the owners of the undertaking which is carried on?—We want national ownership.

13,286. Do you mean that it is the State?—The State, if you like to call it that. It may assume a different form in the future, but for simplicity I will say the "State," without committing myself necessarily to an acceptance of the continuance of the present form of State.

13,287. Who gets the benefit or the money from the carrying on of the undertaking?—The benefits would enter into the national exchequer.

13,288. How do you pay persons whose labour carries on the undertaking?—I want the remuneration of any class of persons in the community to be determined not by what their labour will fetch on an economic valuation, but by a social valuation; that is to say, I want their income to be determined not by any haggling of the market, but by their status in society, and by the feeling of the community as a whole as to the amount of income which they ought to have.

13,289. What do you mean by "their status in society"? Are they to be paid exactly the same amount of remuneration, each man, for their services?—That is a very difficult question. I am talking now of the very distant future, but I think ultimately you probably cannot get any other system than that of equality of remuneration; but, as I say, that is very distant, and I believe you will have to work towards that by a very gradual approximation of incomes.

13,290. Who will fix the varying degrees of income to which those workers by brain or hand are entitled?—Nobody exactly fixes the varying degrees of income, because you start from a point at which various classes of persons are in receipt of certain amounts of money. Suppose you were to institute a Mining Guild: you would find when you instituted it that there was already in existence a normal salary for the hewer, a normal salary for the mine manager, and so on for each grade of workers in the mine. You would take that as your starting point and gradually you would adjust it to your conceptions of social justice. That would probably result in a gradual approximation of incomes, but there would not be any point at which you would be fixing absolutely afresh a new standard of income.

13,291. Who are to be the judges of what you call "social justice"?—I think the community as a whole must be the judges of that.

13,292. Must there be a general election upon the subject?—No, I do not mean that. I mean the variations in the remuneration of different classes

of workers would be determined in the first instance by the Mining Guild itself.

13,293. How many people would there be in the Mining Guild? Would it be one million pit workers?—It would be as many people as are necessary to the carrying on of the industry, including not only the manual workers, but the managers.

13,294. I gather you propose to transfer what I call the property—assume it were my property today—forcibly to someone else?—That is involved in any proposal for national ownership.

13,295. Do you propose to pay me for my property or not?—Yes; not because I think that is a necessary measure of justice, but because I think it is expedient.

13,296. I am glad you are so merciful.

Chairman: Do you think it is necessary to ask this witness many more questions, Mr. Cooper?

Mr. R. W. Cooper: No.

13,297. *Mr. Arthur Balfour:* I have only one question: Do you believe in the co-operative movement?—I want rather more explanation before I can answer the question. I certainly believe in it in general.

13,298. You know what the co-operative movement is, do you not?—It is so many different things. It is, in the first place, a method of distribution; and, secondarily, also, a method of production.

13,299. Do you object to the co-operative movement owning mines?—I object to it continuing indefinitely in the ownership of mines when a new system, such as I suggest, is set up; but I certainly prefer co-operative ownership of mines to private ownership.

13,300. In your evidence on Friday, I think it was brought out that you said the conditions of labour and the strength of trade unions, and so on, had reduced the value of the coal owners' property?—Not quite in those words, but more or less that.

13,301. In fact, you think that, supposing a row of houses was owned by workers (which is quite common in Sheffield, for instance) and the Corporation wanted to buy those houses, it would be quite legitimate for them to cut off the drains, the water and the gas, so as to reduce their value?—I do not remember saying that.

13,302. But that is the conclusion to be drawn from your argument, is it not?—I do not think it is.

13,303. If it is legitimate to reduce the value of the coal owners' property of that kind, why should not the Corporation of Sheffield, when they want to buy the workers' houses, do the same thing?—The whole point is the difference which arises from the existence of the capitalist system and from the relation which now exists between the various classes in industry.

13,304. But surely the worker to the extent to which he owns a house is a capitalist?—If you like to put it that way, he is to a certain extent; but he is not a capitalist employing other persons for hire.

13,305. But you would approve deteriorating his property simply because you wanted to purchase it?—No.

Mr. Arthur Balfour: That is all I ask.

Chairman: Thank you, Mr. Cole; we shall have the pleasure of seeing you later with regard to other information which you will give us.

(The Witness withdrew.)

Professor LEONARD TRELAWNY HOBHOUSE, Affirmed and Examined.

13,306. *Chairman:* I will ask the Secretary to be good enough to read your evidence.

Secretary: "Memorandum on the Nationalisation of Coal Mines, by L. T. Hobhouse, Professor of Sociology in the University of London."

This memorandum has been drawn up in response to a request that the writer should state his view of the best method of applying the conclusions reached in Mr. Justice Sankey's Interim Report. It is understood that the writer pretends to no special knowledge

6 May, 1919.]

PROFESSOR LEONARD TRELAWNY HOBHOUSE.

[Continued.]

of coal mining, but approaches the question from the point of view of a student of social economics. From this point of view certain general considerations occur which may be worth laying before the Commission.

The old methods of conducting the industry of coal mining are condemned in the Interim Report. The question before the Commission is by what system they are to be replaced.

Theoretically it appears possible—

- (a) to erect a trust on the basis of private ownership and control;
- (b) to establish national ownership and control;
- (c) to attempt some intermediate system.

Of these, very brief consideration suffices to rule out the first. The nation would not tolerate an unfettered monopoly of one of the necessities of life, whether exercised by owners or by owners and workers jointly. It would insist on some public control of prices, and, whether directly or indirectly, of production and distribution. It results that the choice is between (b) and (c), nationalisation proper and some compromise with private ownership and management. Several forms of compromise may be suggested, but they will be found to be rooted in the same motives, fear of State ownership and confidence in private enterprise. I do not therefore propose to discuss alternatives in detail, but to weigh these motives against those which point to nationalisation.

The possible advantages of nationalisation are not denied by intelligent critics. It is allowed that it would give the State unfettered freedom in the development of a great national asset, controlled by full and undivided financial responsibility. The community would be able to treat the coalfields as a private owner his estate, with this salutary difference alone, that from the nature of the case the community would be compelled to pay that regard to the welfare of the workers on the estate, which in the case of the private owner is left to his conscience. It seems only reasonable that so great a natural source of wealth, so indispensable to the common life, should be in the hands of the community, and difficult to dispute that, if used with only moderate intelligence, it would prove a great asset in the general prosperity.

The doubts that arise as to the fulfilment of these possibilities may be brought under two heads. One is the difficulty of securing a fair basis of valuation for the compensation of existing owners. This is a matter on which experts must speak. The other, which concerns this memorandum, is a doubt of the efficacy of State control as compared with private ownership and management.

1. *The Disadvantages of State Control.*—It is widely held that all talk of control by the community for the community is a matter of words only. State control means officialism, and though in theory officials are the servants of the community, in practice they are its masters. At its best, it is alleged, the atmosphere of a large office encourages caution and routine rather than enterprise and adaptability. Its conduct of affairs is apt to become wooden and mechanical. Delays in correspondence and cross references from one department to another cause, it is said, an irritation which is sometimes aggravated by the insolence of officials of the lowest grades. In dealing with private firms, a man always has the ultimate remedy of cutting the connection and transferring his business to another house; but in dealing with the State he has no escape. Under private enterprise competition makes the producer willy nilly the obliging servant of the consumer. Under the rule of a State monopoly the position is reversed.

But just at this point we touch the weakness of the argument in relation to the present controversy. The complaints against officialism are, in any case, one-sided, and take no account of the very high qualities manifested by Government Departments at their best. But, apart from this, in the case before us, it is no longer a question between private competition and State ownership, but between some sort of private monopoly and public monopoly. In coal mining the old competitive system is dead, and what we are considering is the question of the best substitute. A

great trust would build up its own officialism with similar defects of temper and less amenable to control. What emerges from the criticisms that we have indicated is the need of organs of effective criticism on official action. Parliamentary control has proved inadequate, partly owing to the sheer growth of the governmental machine, partly to the frequent absorption of Parliament and the public mind in Imperial and International questions. In particular the protection of the obscure individual needs some better security than the chance of getting a question asked in Parliament or of securing the ear of some enterprising editor. It is not enough that, in the case of coal mines, consumers should be directly represented in any public Board of Control that may be set up. What will be necessary is an organised system of dealing with criticisms, complaints and even with suggestions and plans of improvement. At present a complaint against a Department has to go to the Department itself, and the delays in dealing with it are a source of added annoyance. A great public service really requires its own specialised avenue for the reception of complaints and criticisms and a mechanism for sifting them and securing needful redress, which should be essentially independent and impartial as between the complainant and the Department complained of. The Committee on Cabinet Reconstruction, I think, recently recommended a Department of Research. I am not sure whether a general department with such a function would prove valuable, but I would suggest that attached to every ministry of public service a special department, concerned not only with the exploration of new methods, but with the criticism of administration in the interest of the public, and independent of the executive branch, is the necessary corrective to the failings of officialism.* The homœopathic remedy may prove the most effective.

2. *The Advantages of Private Enterprise.*—A candid advocate of nationalisation usually admits certain advantages in the system of private ownership. The private owner of a business, if active and intelligent, makes the best of existing opportunities and looks out for new openings. Unhampered by red tape he is, if not original and inventive himself, at least receptive of new suggestions and ideas. He finds new paths of advance, seeks to open new markets, prospers by new methods. In a word, he has initiative. So much would be granted; but it might be replied that these advantages are subject to serious drawbacks. In the first place, initiative is not by any means the characteristic of all private firms. There is every degree of enterprise or of dull conservatism and routine. New developments, the replacement of antiquated machinery and the like require capital, courage and sagacity, and only the better and stronger firms command the combination. There will always be many lagging in the rear, and as long as their products are required to meet the existing demand, it is their expenditure which in the long run will govern prices. Prices tend accordingly to be adjusted to the needs of the firms that, from one cause or another, are working on the least advantageous conditions, and the margin of profits available for the stronger firms is proportionately high. The public has to pay these prices while the employee gets no proportionate benefit from them since his wages tend to be equalised out on the basis of the amount which the "marginal" firms can afford. This general thesis of economists has received remarkable illustration in the evidence given before the Commission, from which it appeared that the Coal Control, though operating in the public interest, was forced to regulate prices in accordance with the requirements of the more backward and poorest mines.

If under public ownership something is lost in initiative there is a wide possibility of compensation in the levelling up which may not unreasonably be anticipated. Differences in the productivity of mines,

* Essentially I should rely on the same mechanism with the publicity which it would command to correct the liability, which many fear, of a national system to be wrested from the courses of good economy and the public interest by political pressure.

6 May, 1919.]

PROFESSOR LEONARD TRELAWNY HORHOUSE.

[Continued.]

of course, remain, but they need not be accentuated by differences in efficiency of method. It may be suggested that the standardisation of methods having, as it should, the effect of raising the efficiency of the "marginal" mines, would have a beneficial action on prices, which must be governed in the end by costs in such mines—which may well be set against the general increases of cost due to the increases of miners' wages. But to effect such standardisation a very free hand is required. The controlling body must be unfettered in its plans of opening up or closing down this mine or that, and such freedom is hardly compatible with the survival of any private ownership.

But in the comparison of private and public ownership there is a much deeper consideration to be taken into account. Though in the pursuit of private gain, owners or employers may be forced to serve their customers and indirectly to promote public ends, the motive is not that of public service but may even be opposed thereto. Private enterprise may make its way not only by the improved organisation of an industry but by hard bargaining, paring down of expenses, and the preference of customers who can pay best without reference to the question whether they have the greatest needs. Nor does private enterprise, as such, have to make its account with costs which must be borne by the community. It may "pay" a private company to run up unsanitary houses for the immediate accommodation of miners. The cost of housing in disease and general deterioration only falls accidentally and in small part upon the company. The community having the whole cost of wasted life and energy, impaired vitality, and perhaps lowered standards of civic efficiency in view, would apply quite another standard of cost and might reckon as debits houses that figure as assets in a private owner's books. In the long run the major portion of economies effected by the underpayment of workpeople, or their exposure to unnecessary dangers or unsanitary dwellings, comes back as costs upon the community, whether in the shape of higher poor rates or of the lowered vitality and productive power of the population. It is no answer to say that good employers realise these things and are not bound hand and foot to calculations of profit, for the question before us is not the goodness or badness of men, but the efficacy of a particular motive; and it is, therefore, relevant to show that the incentive of profit, if it leads to some good results, would also, of itself, lead to some others which are very bad.

It must be added that whatever efficacy the desire for profit possesses as a stimulus to exertion belongs to the epoch of free competition. It is the effort of one man to get ahead of another that introduces the racing spirit. But coal mining appears to have passed beyond this stage, and the stimulus of profit loses accordingly what value it may have possessed under different conditions. On the other hand the alternative motive of public service has materially gained in strength. Not only is this a higher motive in itself, but at the stage of social education now reached it has become for large classes of manual workers the more real and effectual stimulus. As against the desire of the employer for gain must be set the growing disinclination of the employe to work for the profit of another. Intelligent workmen are, of course, aware that there should be in normal industry a margin of profit over all expenses, and that in the most favourably situated branches of an industry this margin may be considerable. What they resent

(The Witness withdrew.)

Chairman: Gentlemen, I am very glad to say that the Hon. Thomas Ryan, who is the Premier and Attorney-General of Queensland, has been able to come here to tell us about the system of nationalisation in Queensland. I had hoped to call him somewhat later when we come to the question of what has

is that it falls into private hands. While fully prepared to do their best for the common good they will only give their services reluctantly to that which rightly or wrongly, they regard as private exploitation. We get here to the very root of industrial unrest, which is the growing belief that the only master that a man ought to serve is the community, combined with the determination that as a member of the community he should have some effective, and not merely nominal, voice in the control of the conditions under which he works. To satisfy this double demand is not only to cure the unrest, but to cure the real evils that cause it. The cure will no doubt have to take different forms in different industries, but in the case of coal mining conditions have come about which admittedly necessitate national control, and the contention is that this control will be most effectively and responsibly exercised on the basis of national ownership. Under such ownership, it may be urged, the psychological conditions which are now a cause of friction and waste would be converted into a very real and valuable asset.

The same conditions offer a means of compensation for the loss of private initiative. The working miner has his experience to contribute to the problems of management and it should be an integral part of any scheme of nationalisation to engage the work of all ranks through their own representatives in the conduct of the individual pit, of the coalfield, and finally of the entire industry. The working management of the mines should be a partnership between the workers of all grades and the consuming public. Such a partnership again is easier to work out if unencumbered with a third partner in the shape of the existing ownership. It is the duty of the State to make the most of this great natural source of wealth with due regard for the fair remuneration, safety, proper housing, &c., of the worker. This duty is performed awkwardly and against friction when carried out by the control of a private body charged primarily with the financial interests of its own clients. Full control, in fact, implies ownership and requires full financial responsibility for its ballast. Again, it is the duty of the workmen not only to support their wives and families, but to serve the community, and this duty will never come home to them in its fullness till they are recognised as servants of the community and see for their part that increments of wages no longer come out of private profits but from the purses of consumers or taxpayers, many of whom may be poorer than themselves.

The conclusions which emerge may be very simply stated:—

1. As compared with the old system of numerous competitive firms, nationalisation has advantages and drawbacks. Intelligently used, the advantages should be the greater.
2. As compared with a mixed system of public and private control, which now appears to be the only alternative, nationalisation has everything to recommend it. It is probable that any intermediate system would combine the drawbacks and forfeit the advantages both of nationalisation and of competitive industry.

Chairman: Does any member of the Commission wish to ask any questions on the witness's *précis*?—
(No reply).

been done in our Colonies and other countries on this subject. He has very kindly come here to-day, but he has to go back to Queensland at 12 o'clock, so that there is not much time, and I will ask him to come at once into the witness-box.

The Hon. THOMAS JOSEPH RYAN, Sworn and Examined.

Chairman: This is the statement of the Hon. T. J. Ryan, Premier and Attorney-General of Queensland, "Nationalisation of Mines and

Minerals." A copy of every Act referred to in the statement has been handed to the Secretary, and they are at the disposal of any Commissioner or the

6 May, 1919.]

HON. THOMAS JOSEPH RYAN.

[Continued]

Press if they wish to see them. The witness's statement says: "The present Queensland Government was returned to power in May, 1915. During their term of office they have largely increased the number of enterprises carried on by the State. Prior to their taking office the principal lines of railway were controlled by the State under the Railways Act." Then we come to additional State enterprises carried on by the present Government, including those carried on under Acts of Parliament, and there is a list given of the State enterprises which are carried on under Acts of Parliament. "(a) State insurance, which is carried on under the State Insurance Act of 1916 and the Workers' Compensation Act of 1916; (b) Mineral oil production, under the Petroleum Act of 1915; (c) State fish shops, under the Fish Supply Act of 1916." Then, in 1916, there was passed an Act of Parliament called the State Enterprises Act of 1916, and under that Act of Parliament there are carried on "(d) State pastoral stations, (e) State meat shops, (f) State sawmills, (g) State coal mines, (h) State iron and steel works, (i) State canneries, (j) State batteries and (k) State hotels." Then there are carried on under Parliamentary appropriations arsenic mines and railway refreshment rooms. Then the witness says: "These enterprises have been carried on successfully, and, in particular, I refer to the balance sheets for 1917 and 1918 of the State Insurance Department, which show a surplus for 1917, £27,795 6s. 3d.; for 1918, £74,884 6s. 3d. The method of disposal of the surplus is shown at page 5 of the Report for 1917 and pp. 5 to 8 of the Report for 1918. These profits were made notwithstanding the fact that the advantages to injured workers were increased by 75 per cent. without any corresponding increase of premiums. The Auditor-General's Report for 1918, dealing with the enterprises carried on under the State Enterprises Act and with railway refreshment rooms, shows that the aggregate net profit therefrom for the year ended 30th June, 1918, was £123,007 2s.

"Although profits are shown, the object of carrying on a policy of nationalisation of public utilities is not for the purpose of profit-making, but to assure to every worker the full benefit of his labour and to provide the consumer with commodities at reasonable prices by the elimination of the middleman.

"It has been found necessary to have sympathetic administrators of these enterprises. The greatest success is achieved where those carrying on the work believe in, and are sympathisers with, the policy of nationalisation.

"The failure of some of these enterprises to show a profit has been due to transient causes and to the fact that in the initial stages capital expenditure has been incurred on work (e.g., in the case of coal mines on shaft sinking and developmental work) on which no adequate return can be made until the enterprise has been more fully developed. (See p. 16, para. 31, of Auditor-General's Report.)

"As regards Coal-Mining.—State coal mines have been established or are in course of development in Southern, Central and Northern Queensland, namely, at Warra, in Southern Queensland; Dawson Valley, in Central Queensland; and Bowen, in Northern Queensland. The present sites were chosen principally to provide supplies for the use of the Government railways at the various centres, although it is intended to supply private consumers as the production increases and the industry is developed by the Government. As the operations of the State increase a corresponding saving will, it is hoped, be effected both in the wholesale and retail distribution of coal, thereby reducing the price of coal, as the expenses of agencies and administration will become less as the trade tends more and more to become concentrated in the hands of a great organisation like the State. At the State coal mines change-rooms and bath-houses are provided for the miners.

"It is interesting to note that during the year 1917 the carrying of coal from Southern to Northern Queensland by Government chartered steamer resulted in a saving to the State in freight alone of £12,700. Had the steamer not been chartered it would have been difficult to supply the northern por-

tions of the State with coal and coke, and copper supplies for munition purposes from Mt. Cuthbert and Mt. Elliott would have ceased.

"It is hoped that with the development of State coal mines it will be possible for the Government to establish State coke works. In this way the Government will be able to supply not only coal but coke to the State iron and steel works which it is proposed to establish under the State Enterprises Act. It is confidently expected that when the scheme of State production of coal and coke and the establishment of iron and steel works is carried out the result will be as satisfactory as that which has followed from the establishment of the State insurance scheme. The cost of distribution will be reduced and the middleman's profits eliminated.

"The Queensland law relating to the ownership of minerals, including coal, is contained in the Mining on Private Land Act of 1909 and The Land Act of 1910 (s. 6 (3)). As to the method of obtaining a lease of Crown lands for mining for coal or mineral oil, see the Mining for Coal and Mineral Oil Act of 1912.

"Land Nationalisation.—Crown lands cannot now be alienated in fee simple: perpetual lease tenure has been substituted. The rent is limited to one and a half per cent. of the capital value for the first ten years, when it becomes subject to determination by the Land Court. (See the Land Act of 1919 as amended by the Act of 1916)."

Mr. Ryan, I am very much obliged to you for your assistance to the Commission.

13,307. Mr. Robert Smillie (To the Witness): You referred us to an Act of Parliament dealing with the ownership of land and minerals and the methods of leasing. Could you tell us at the moment whether the minerals are the property of the State?—I have not the Acts in front of me, but a perusal of them since 1909 will show the exact position. As I recollect the provisions of the Acts since 1909, coal is the property of the State with regard to lands alienated subsequent to that date. Prior to that date they went to the owner of the land. Of course, in Queensland there is a very large area of Crown land and the greater proportion of the land is Crown land.

13,308. With regard to Crown lands, where they have not been leased or granted away, they are still owned by the State as to the surface and the minerals?—That is so, and all land alienated since 1909.

13,309. Land granted prior to that carried with it also the ownership of the minerals, did it not?—Ownership of the coal in some cases, but never of the gold.

13,310. Is it of coal only?—I would not say it is of coal only. In fact, I do not think in every case it carried it as to coal, but in a large number of cases prior to 1909 the title to the coal went with the title to the land.

13,311. Was what are called the precious metals reserved?—They were always the property of the Crown.

13,312. Of course, you are aware that this Commission is dealing primarily with coal mines?—Yes, that is so.

13,313. Does your experience of State enterprise justify your giving an opinion as to State mining being successful?—Yes, I think it does. In my opinion it has been successful and, generally speaking, as you would gather from the nature of my evidence, I have formed the opinion that the nationalisation of public utilities is beneficial to the public generally.

13,314. When you have nationalised other public utilities outside coal mining, have you taken them all over? I mean with regard to any public utility that you took over, did you take it over nationally?—Do you mean completely?

13,315. Yes, completely?—No, we have not done that, but that is our objective.

13,316. Did you set up State butcher-shops side by side with private butcher-shops?—Yes.

13,317. Would that mean that with regard to public utilities you have a monopoly?—In the case of mineral oil the Act provides for a monopoly, and State insurance for workers' compensation is a monopoly.

6 May, 1919.]

HON. THOMAS JOSEPH RYAN.

[Continued.]

13,318. You might perhaps have greater difficulty in taking over a public utility if you are still open to competition?—Oh, quite.

13,319. You would have to run your section of any public utility sufficiently intelligently to enable you to meet keen competition from individual owners?—Undoubtedly. Of course, the fact that we did not take over the whole of the utility would be to some extent due to the fact that during the war, which is the period during which our Government has held office, the difficulty of financing has been very great. We are not allowed to issue our own debentures beyond a certain quantity to be approved by the Commonwealth under their War Precautions Act.

13,320. We may take it from that answer that the experience of the last four years has been a more difficult experience to the Government than it would have been under normal conditions?—Quite so—particularly from the point of view of financing or using the credit of the State by the issue of debentures.

13,321. You have had greater difficulties than you would have had under normal conditions if there had been no war?—Absolutely, because the amount we could issue in debentures was limited to a certain quantity, or certain number.

13,322. Has the tendency towards State ownership been hastened by the war, or was it in the minds of people prior to the war?—In answer to that, it has been the policy of our party when they were in Opposition, even before the war, and part of our programme. But I may put it in this way—during the war I think in some respect we were afforded a better opportunity. Take, for example, our State cattle stations and State butcher-shops. The fact that the price of meat was soaring up helped us in a sense to step in, or made it necessary for us to step in and establish State cattle stations and also meat-shops, so as to control the price of meat from the private vendor, and enabled us to supply meat ourselves cheaply and to control the cattle market by bringing in fat cattle when there was a shortage in order to regulate the general price of stock.

13,323. With regard to the meat trade, which is rather an important item, during the war could it be taken that the action of the Government prevented a soaring up of prices against the people?—Oh, undoubtedly.

13,324. Did the Government lose by taking over the meat supply?—No; we show a profit and a very considerable profit.

13,325. Your experience has convinced you, has it not, that had you not taken the action which you did take, the price of meat as against the consumer would have been considerably higher?—Oh, much.

13,326. And the profits, in that case, would have gone to the private owners in that industry?—Quite so—either the owners of the cattle, or the owners of the meat works, or the private retail butchers.

13,327. Amongst the private owners in one shape or form?—Yes.

13,328. I understand you controlled outside of ownership; you fixed prices in many directions, did you not?—Yes, we did.

13,329. Do you think, had it not been for State interference, that in all the cases in which you fixed prices, the prices might have gone considerably higher against the consumer?—Yes, I think they would.

13,330. Did the fixing of prices tend to ruin any of the persons engaged in any industry where you fixed prices?—No; I do not know of any case of anyone being ruined, or even hardly pressed upon.

13,331. I suppose there has been complaint of State interference?—There have been many, many complaints of State interference, but that comes from a quarter which is interested in profit-making.

13,332. Of course, you think it a natural thing that persons interested in profit-making would protest against State interference?—Undoubtedly.

13,333. But, as a matter of fact, you do not know of any case in which your interference has ruined any persons engaged in the trade?—No, I do not.

13,334. So far as mining is concerned, you have not a monopoly, I think?—No, we have not yet.

13,335. Does the experience of the Government with regard to State mines justify you in feeling that

you will extend your operations if possible by purchase or otherwise?—Yes, we intend to extend our operations first upon Crown lands, which are already our own property in every respect, both as to surface rights as well as the mineral rights under the land.

13,336. In that case do you mean by exploration, boring and sinking to develop the minerals in the Crown lands?—That is so. Of course, now we sometimes bore in the vicinity of places where there are privately-owned coal mines with the view of testing the extent to which the coal extends around them, and that is a thing which could not be undertaken by any individual private owners.

13,337. Is that a very necessary precaution in order to prove your minerals?—That is so.

13,338. As the law stands at present, is there any likelihood of your leasing any of your Crown lands containing minerals to private individuals for exploitation purposes?—No, certainly not for exploitation purposes. Our policy is to retain the mineral property of the Crown as also the land. We are alienating no land in Queensland now except under perpetual lease tenure.

13,339. Have you had any complaint from the workers' side that they are worse treated under State ownership or in the State mines than in privately-owned mines?—No, certainly not.

13,340. Have you heard that the ton rates paid to the workers for working similar seams in the State mines is rather higher than it is in the privately-owned mines, and have you any knowledge of that?—I cannot say that off-hand. I should want to know the details more.

13,341. The reason I put it to you is this. I have a letter from miners out there giving the ton rates in the various seams?—No doubt what they say to you would be correct, because they would have no reason for not stating the truth. But the administration of the mines is not under my particular department; it is under the Minister of Mines.

13,342. Have you had any friction with the workmen in the State-owned mines as the result of taking over the mines?—None at all.

13,343. I think there has been in the past considerable difficulty between the workmen and the owners of the mines when they were privately owned?—Yes; of course, there have been the usual industrial disputes which arise between workmen and owners. That is common to everywhere and not only to Queensland. It is world-wide.

13,344. I was wondering whether it had increased because of State ownership?—No, certainly not. Of course, so far as our State enterprise of mining is concerned, it is only in the developmental stage at present. We are not long enough in power to have developed it to what will be its normal condition.

13,345. Of course, the industry itself is not a very old one as compared with the industry here?—Quite so.

13,346. It might be taken that you really only took over certain mines to supply your railways and the needs of the Government. That is not the case, but that was the beginning of it?—Yes, that is only the beginning; that is the stage we have reached at present.

13,347. Do you think the success of that justifies you in believing that it will be extended further than is necessary even to supply the State?—We are quite confident of that, and, as I say, we propose to establish State coking works and State iron and steelworks, so that we will require coal and coke not only for our own railways, but also for our State iron and steelworks which we hope to develop in the future.

13,348. With regard to those proposed coking plants and iron and steel plants, do you propose to keep them in the hands of the State?—Yes, we do.

13,349. Do you know whether or not coalmining, generally speaking, was a profitable concern in Queensland and other States of the Australian Commonwealth?—I think so; I think it was profitable.

13,350. So far as you know, it was reasonably profitable?—Oh, undoubtedly.

13,351. Would you tell us, if you happen to know, whether private mine owners who owned the mines

6 May, 1919.]

HON. THOMAS JOSEPH RYAN.

[Continued.]

joyfully accepted your decision to open up mines for yourselves and take over the mines?—They did not make any statement to the Government upon the matter. We were entering upon so many State enterprises which hit the private owner more than the coalmines—more particularly our insurance and State meat shops. Those are the things that caused the main outcry, because they more nearly touched the private owner.

13,352. This is a very important matter upon which you might be able to assist us. Have the workers in the mines any connection with the control of the industry where they have been taken over by the Government as between the Government and themselves?—Of course the method of carrying on these State enterprises is contained in the various Acts. They are carried on by the Government Departments, and under the State Enterprises a Commissioner of State Enterprises has been provided for and subsequently appointed. That was not our proposed policy. We did not wish to have a Commissioner, but the Legislative Council, the Second Chamber in Queensland, insisted on making that amendment. Our proposal was to have a Minister who would carry it on and who would be directly responsible to Parliament and who would have control of those enterprises.

13,353. A Minister of Mines.—Well, he would be a Minister of State Enterprises.

13,354. State enterprises of all kinds.—Yes, we proposed to group them.

13,355. I suppose you have not yet had sufficient experience to know how the accident rate in the State-owned mines compares with the accident rate in the mines which are privately owned?—No, we have not had a sufficiently long experience of it for that. As I say, it is only in the developmental stage, and you could hardly compare the period that we have been carrying on coalmining with the long period over which it has been carried on by private enterprise; but I should certainly think the accident rate would not be higher.

13,356. You would not be justified in giving a comparison of course, unless you had a sufficiently long experience to know?—That is so.

13,357. Did the Government think about the question of safety at all when they made up their minds to take over to some extent the mines?—Of course that would be a thing that would always be before the consideration of the Government and particularly of the Minister. As a matter of fact safety is provided for in privately-owned mines under the Mines Regulation Act. There are very strict regulations and very rigid inspection provided even for privately-owned mines. That is at the instance of the Government of course.

13,358. That was of course absolutely necessary when State mining was established to any extent?—Yes, and in that connection, I fancy, if I remember rightly, that the men have a right of having a check inspector.

13,359. Yes, I think that is so under law.

13,360. *Mr. R. W. Cooper*: Do you mean from among their own class?—Chosen by them.

13,361. *Mr. Robert Smillie*: I suppose your laws are framed very much on ours?—Of course, I have not the Act in front of me and I am speaking from memory, but that is my recollection.

13,362. I think you may take it that the Mines Regulation Acts of all our Colonies follow pretty closely on the legislation of the mother country?—I think they do.

13,363. Did you actually acquire from the private owners some mines which were already going concerns?—In one instance we did. The other two were upon Crown lands, but at Warra we acquired it from a private company. At that mine we are only in the process of sinking the shaft (the coal is somewhat deep) to the point where production of coal will be profitable.

13,364. Of course, I take it you would admit that in a country which mines so extensively as this country does, very great care requires to be taken on the question of nationalising the mines and changing them from private ownership to State ownership?—Yes, I should think so. It is a very big proposition

and will require very, very careful consideration in detail as to the manner in which it is to be taken over and the price and compensation, and so on.

13,365. Besides, I suppose you would require to consider whether or not the management of the mines and the workmen in the mines would work as well for the State as they do under private owners?—Yes, that is so. In other words, you would have to be ready to take on the running of the whole concern.

13,366. Probably one of the most important questions we shall have to deal with here is whether or not persons employed by the Government to work and develop industries would really work as well for the Government as for private owners. I want your experience as to that?—Do you mean whether they would work as well?

13,367. Yes; whether they would give the same energy and honest service to the State as they have given and are giving to private individuals who own industries?—Our experience is that they give the same honest service to us as they do to private individuals.

13,368. That is the point I want to get from you, because that is the strongest point in opposition to nationalisation here. Have you found in your various State industries that the managers and other servants who have been appointed by you have given perfectly honest service to you?—Absolutely. I have mentioned in my statement that sympathetic administration is necessary. It may be that in certain cases you would find an officer who really was against nationalisation and opposed to your policy, and you would not get the best success from him, but that is not the point that you are putting to me.

13,369. My point is that it is said that almost the only incentive to give good work is the hope of financial gain from it. Do you agree with that?—No, I do not. That must be a general proposition applying to everyone and every calling in every walk of life.

13,370. You would think it would be natural in a well regulated State that the workmen and the managers and all concerned would be more likely to give good service to the State than they would give merely for the building up of profits for the individual owner?—I think they would give the better service to the State—or, at all events, as good service.

13,371. In your own experience you have found nothing to belie that opinion?—Absolutely nothing.

13,372. *Mr. Arthur Balfour*: What is your oldest State enterprise?—I suppose the railways.

13,373. How long is that?—That is right from the beginning of the State. The State of Queensland was separated from New South Wales in 1859.

13,374. What was the next State enterprise after that?—After railways, I think it is set out in my paper that it was the petroleum industry.

13,375. How old is that?—That goes back for quite a number of years, but we have not produced petroleum oil yet; we are only boring.

13,376. So that there is no financial result to be shown from that or any result?—No.

13,377. Then your fish shops come next. Have you been running them for some time?—Since our Government was in power.

13,378. Is that 1915?—Yes.

13,379. Have they been a success financially?—I should say so. They do not show a profit yet, if that is what you mean. That will appear in the Auditor-General's Report, which I have put in. I think he shows a loss as a matter of fact, but it is only in the developmental stage yet.

13,380. Do I understand that the meat shops show a profit?—Yes.

13,381. That is under war prices really, is it not?—Of course they have been only established since the war. They do not show a profit on account of the war.

13,382. In calculating these profits (I do not want to take you through all the accounts) what sort of depreciation is allowed? Are the profits net or gross?—The Auditor-General's Report will show that. I think he shows net profits. I know in the case of the butchers' shops they allow a very large amount of depreciation. You will find it is much higher than what is usually allowed in private enterprises.

6 May, 1919.]

HON. THOMAS JOSEPH RYAN.

[Continued.]

13,383. It would interest us very much if you could give us a little more information as to how the State enterprises are run. What is the organisation? Have you a Commissioner? Yes, we have lately appointed a Commissioner.

13,384. Is he in charge of each enterprise or in charge of the whole of them?—Some of them are under Ministers. The Minister for Railways, for example, runs the railways; the Minister for Mines runs the mines and also petroleum oil. The Commissioner was only appointed about six months ago. He has such enterprises as the Government in Council assign to him. When I left Queensland in January last, I think it was only two or three enterprises we had assigned to him.

13,385. What is the basis of his organisation? Is his an organisation like an ordinary business concern?

His objective is to get an efficient organisation. He appoints officers and so on who are competent men to look after different branches of business.

13,386. Have you any sort of boards or pit committees at the pits composed of State officials and the workers?—We have not any joint committees of that sort. The Government keep the whole control of the matter.

13,387. So that the State really has the whole control like a private owner has?—I would not like to say just as much as a private owner has. That might convey a negation of the policy of nationalisation.

13,388. I mean it is the same sort of control: they can make a decision without reference to joint committees?—Yes.

13,389. And they do take prompt decisions?—Yes; that will appear from the different Acts, and you will see what their method of management is.

13,390. You can conceive that it would be difficult to run an enterprise of that kind without some one at the head who can take prompt decisions?—Yes. There should be someone or somebody at the head, no doubt. I would not say one individual, but certainly heads. Whether they should be associated with these advisers or not would be a matter for the administration.

13,391. It is a matter upon which we should like to have your views if you could enlarge them a little, because it is a very important point?—I put it in this way in my statement—that there should be a sympathetic administration by people who believe in the policy and by people who are competent to run the concern.

13,392. But they are executive officers of the State?—With us they are. We would appoint and propose to run some one who has been a thoroughly competent miner. To run our Insurance Department we would appoint a man who has had long experience of insurance and so on.

13,393. That is a very reasonable thing to do. With regard to insurance, is it confined entirely to workmen's compensation and insurance?—No.

13,394. Do you also do marine insurance?—Yes, and general insurance.

13,395. Is it possible that you have made some war profit out of marine insurance?—I think the main profit was out of the workers' compensation, and very little out of general or marine insurance.

13,396. I take it you have no iron or steel industry established yet?—No.

13,397. And by batteries, I take it you mean batteries for gold mines?—Yes, public batteries.

13,398. Have you any of those running?—Yes.

13,399. Are they successful?—Yes, very successful. I should like to be able to put the figures before you, but you will find them amongst the papers.

13,400. Have your refreshment rooms been successful?—Yes, very successful.

13,401. How many have you?—The State Railway refreshment rooms are all over the State.

13,402. I take it the hotels are a separate enterprise?—The main State hotel is at a place called Babendy in North Queensland.

13,403. Have you any others, or is that a first experiment?—There is only that and the refreshment rooms, which, of course, run bars the same as they do here.

13,404. They have bars?—Yes, in connection with some of the refreshment rooms, but I think the profit on the hotel was quite large.

13,405. Mr. R. W. Cooper: I gather that this colliery at Warra is still in the course of being sunk?—Yes.

13,406. And you bought it from private owners?—Yes.

13,407. The other parts of your coal project relate to collieries you propose to establish on Crown land?—Yes.

13,408. To work Crown minerals?—Yes, that is for the present. We have had under consideration the taking over of some very large mines. I do not want to go into details of our negotiations.

13,409. You mean privately owned coal mines?—Yes, to a very considerable extent, but we did not come to terms with the owners. They wanted more than we were prepared to give and we were able to turn round and start on our own account.

13,410. But you did attempt to negotiate with the owners and buy them in the ordinary way?—Yes.

13,411. As regards the rate of pay, I suppose your experience with regard to coal mines is very limited in regard to paying the workers. How does the State rate of pay compare with the private rate of pay?—I can only speak of our objective which is that the State should be a model employer. That is how we express it. The wage for coal miners, or any other workers, is fixed by a tribunal, the Arbitration Court. We have a Court of Conciliation and Compulsory Arbitration, and nearly all the workers in the different industries in Queensland work under awards made by that tribunal.

13,412. As they do in New South Wales?—Yes, and of course that tribunal does not make a difference, as a rule at all events, between a State employee and an employee in private employment.

13,413. Does that tribunal regulate the salaries of managers—I use the word "salary" as distinct from the word "wage"?—Well, it could regulate salaries; as a matter of fact it does regulate the salaries of public servants in Queensland.

13,414. Are the salaries quite as liberal as the private salaries? I am thinking of the upper grades of management?—Well, I think they are. It is difficult to compare an Under-Secretary with the manager of a big business outside.

13,415. And, of course, one does know that the State salaries generally in the Commonwealth are a good deal below our English scale?—Well, in some instances they are. You are speaking now of the higher salaries and not of the wages of workers?

13,416. Yes. About what is your present output of coal in Queensland per annum? Have you any idea?—I cannot tell you the exact amount. I think it appears in the statement or some of the annexures.

13,417. Chairman: I should like to know that if we can get it. Does it run into a million tons?—It is in the document that it is a million and 48 thousand tons.

13,418. Mr. R. W. Cooper: I think the total of the Australian output in peace times is about 11 or 12 millions?—Probably.

13,419. Of course, you mean the whole of Queensland?—Yes.

13,420. As I understand the position, there is no output yet from the State mines?—Very little. There is a very little from Warra, but they are in the development stage.

13,421. In fact, they are establishing the colliery and they get a few coals as they establish the colliery?—Yes. I conclude that our experience in the nationalisation of coal mines will be as successful as it has been in the other enterprises which we have proved to be a success.

13,422. Have you had any trouble with your coal miners yet; have you had any strikes to contend against?—No, not yet.

13,423. I suppose the number of miners at present is very small?—It is not a large number—nothing like the railway department or other departments.

13,424. Have you ever had any strikes on your railways in Queensland?—Yes, we have had a strike in the northern part of the State.

6 May, 1919.]

HON. THOMAS JOSEPH RYAN.

[Continued.]

13,425. *Mr. Evan Williams*: You have nothing in the way of comparison between State-owned mines and privately owned mines which would be very valuable to us?—I do not think I have, except I have referred to baths for the men, and so on, which are referred to in that proof.

13,426. You have baths at the State mines, but they have not at the private ones?—That is so.

13,427. *Sir Allan Smith*: Where did you get the cattle for these meat shops of yours?—We get the meat from the meat works.

13,428. So that you do not produce the raw material?—We produce some, but the main proportion we buy from the meat works under a contract.

13,429. Do you pay the ordinary competitive price for what you purchase?—We pay the meat works a little more than pre-war prices—about 3½d. a pound—for the supply of 7,000 tons of meat a year.

13,430. Who runs these meat works?—They are privately run. We have State meat works now established.

13,431. Does the ordinary purchaser of meat pay the same price as you are paying in the open market?—No. He might pay a little more in the open market.

13,432. Where do you effect the saving which enables you to sell your meat at less cost? You say you sell to the consumer at less cost than the ordinary private enterprise sells at?—This is how we work it. We say that the meat costs so much, and we have rent and wages to pay. We work out what it costs to do that and we sell at what will allow a slight margin of profit to make a reserve and to provide for contingencies so that it will not be finally run at a loss.

13,433. With regard to the payment of people who are in your shops, have they any bonuses on sales?—No.

13,434. They are paid net time wages?—Yes; they are paid the award wages and overtime.

13,435. You have not any coal to distribute. Have you any products which you do distribute to private purchasers?—No, nothing beyond meat.

13,436. So that you have no experience of the distribution of products other than meat?—We have a State produce agency now established. That is intended for the marketing of the product of all the primary producers.

13,437. But you have not been able to prove the value of that?—Not yet.

13,438. You say your objective is that the State should be a model employer?—Yes.

13,439. I suppose you agree that there are some good qualities in employers?—Of course.

13,440. And therefore you propose to adopt these good qualities and dispense with the bad ones?—It would be a good idea if you could. Of course, I am not so foolish as to suggest you can do all that.

13,441. No, but your objective of course is your aspiration?—Yes.

13,442. Do you agree with the suggestion that industries should be controlled by committees of workpeople?—I have told you how we control them.

13,443. What is your view?—Do you mean that it should be controlled by committees of workpeople?

13,444. Yes?—I would not hand the industry over wholly to those employed in the industry if it is owned by the whole community.

13,445. *Sir L. Chiozza Money*: The question of profit has been mentioned. Is it right to say that the Queensland Government has set before it in this question of public ownership, first of all, the interest of the community?—That is correct.

13,446. Is it your first object to give cheap (in the best sense of the word) commodities to the consumer?—Yes, that is so. The term we use is "at reasonable prices."

13,447. With regard to meat, was it the fact that when you opened these State butcher's shops the price of meat had soared to an extraordinary height in Queensland?—Extraordinary for Queensland, but not extraordinary for here.

13,448. It reached about 1s. a lb. for Queensland in some cases, did it not?—Yes.

13,449. What was the effect upon those prices of opening the shops?—The effect was to control the price charged by the private vendor of meat and to provide cheap meat in our own shops which supply a considerable number, about 15,000 families a day, and our fat cattle again effect a control over the fat stock market. We brought in droves of fat cattle whenever there was a shortage in the fat cattle market.

13,450. Did it compel the privately owned shops somewhat to conform to your State prices?—It compelled them to be more reasonable than they had previously been.

13,451. So that the community gained not only through your shops but through the other shops?—Undoubtedly.

13,452. There is a very important point which has been raised again and again in our deliberations. Is it possible for State enterprise to find competent managers? May I ask what your experience has been?—Our experience has been that we have been able to find competent managers.

13,453. Do you find the State is able readily to command the services of really good men?—I do.

13,454. Who are quite equal to the best men employed in private enterprises?—Quite so. It is very often a matter of what you pay them.

13,455. One other important matter has been raised, and that is with regard to political influence. Have you had difficulty with regard to these appointments, or any appointments, whether of managers or workmen owing to political influence?—No.

13,456. How do you deal with that? Has any attempt been made to exercise it, and, if so, how do you deal with it?—Of course, we do what we think is right. We have not had political influence attempted on us. I should think, if it were attempted, our proper attitude would be to act, notwithstanding that pressure; in other words, you must, if you are going to carry on any Government efficiently, have a strong executive that do its duty. People always have the remedy by getting rid of the Government if they do not do so.

13,457. As a matter of fact, political influence has not had any part in the making of the managerial departments?—No.

13,458. Are you quite sure of that?—Quite sure.

13,459. With regard to the actual workmen who are employed in these industries, do you find that you get a fair day's work out of the men?—Undoubtedly.

13,460. On the whole are the men satisfied with their conditions of employment?—On the whole they are.

13,461. With regard to insurance, I understand it is a monopoly?—The workers' compensation part of it is a monopoly.

13,462. Is it the fact that you are able to give very much higher benefits for the same cost? Taking the premiums paid by private employers before your monopoly, are you able to give higher benefit for the same cost?—Yes, much—75 per cent. higher.

13,463. That is to say, you give 75 per cent. more benefits for the same cost of premium?—Yes, we raised the amounts payable for fatal accidents from £400 to £600, and the weekly payment for partial disablement from £1 to £2, and for total disablement from £400 to £750.

13,464. Was that done by economies in State management?—Yes, and of course less profit. I do not know what profit the private companies may have been making.

13,465. Is it a fact that after raising the benefit 75 per cent. you made an incidental profit?—Yes, of £50,000 in one year.

13,466. *Mr. R. H. Tawney*: It is possible to get copies of this book, "Socialism at work relating to Queensland"?—I am sorry to say I have not sufficient copies with me for everyone here, but I shall be very pleased to send them over.

13,467. *Mr. Robert Smillie*: Sir Alan Smith put a question about whether or not you would give control to the workers, and you said you were not prepared to hand over to the mine workers or other workers the whole management?—I said "entirely."

6 May, 1919.]

HON. THOMAS JOSEPH RYAN.

[Continued.]

13,468. Would the same objection take place to handing over partially?—I should not think so, but I refer to our method of management as contained in certain Acts of Parliament. If I were running coal mines, I should certainly want the advice of the Miners' Committees and so on.

13,469. The manager of course is under the law and

must be held responsible for the safety of the men?—Yes.

13,470. But the manager might surely by consulting a committee do that better?—Undoubtedly that would be a very useful and very necessary thing, I should think.

(The Witness withdrew.)

Mr. WESTGARTH FORSTER-BROWN, Sworn and Examined.

Chairman: This is the first of the witnesses on the question of royalties.

Witness: Might I ask if I can have the Report of the Land Acquisition Committee?

13,471. Chairman: I will deal with that when I come to it:

"He is a mining engineer with thirty years' experience as member of the firm of Forster Brown & Rees.

His firm are the mineral advisers in South Wales for properties aggregating about 60,000 acres, with an average annual output of 7,000,000 tons.

He also acts as mineral adviser for estates in charge of His Majesty's Office of Woods and Forests, and for important lessors of minerals in parts of Great Britain outside South Wales.

In accordance with the instructions of the Commission he has come to state his views upon:—

1. The nationalisation of mineral rights.
2. Should that be decided on, the method of compensation to be adopted.

The present system of private ownership of mineral rights has not, in witness's opinion, interfered with the free development of the mineral resources of the country. This is proved by the rapid development which has taken place in the several coalfields of the country.

Witness puts in a Table compiled from the return of the Inspectors of Mines, showing the output of coal from each of the chief coalfields for the years 1880, 1889, 1897, 1907, 1913."

That table is attached. I will read the totals, in order that the Commissioners may see Mr. Westgarth Forster-Brown's point. Total for Scotland, England and Wales, 1880, 146,000,000. Is that tons?—Yes, tons.

13,472. 146,000,000 tons in 1880; 176,000,000 tons in 1889; 202,000,000 tons in 1897; 267,000,000 tons in 1907, and 287,000,000 tons in 1913:

"This Table shows that with the exception of South Staffordshire there has been a continual and rapid increase of output in the majority of coalfields. The several districts have been regrouped between 1907 and 1913, and it is not possible to make a reliable comparison between these two years, but comparing 1907 with 1897, the largest increase amounting to 56·24 per cent. was in the Midland coalfield; 52·31 per cent. in the West of Scotland; 46·2 per cent. in Yorkshire and Lincolnshire; 44·2 per cent. in South Wales including Monmouthshire; 31·67 per cent. in the Newcastle coalfield, and smaller increases in other coalfields.

The increases in 1897 compared with 1889 were less, amounting in the total raised to 14·2 per cent. as compared with 32·5 per cent. between 1907 and 1897.

In the South Wales coalfield between the eastern outcrop of the coal measures and a line drawn from Port Talbot to Hirwain out of 234,000 acres or thereabouts underlain by coal measures only 7·4 per cent. of the area remains unlet, whilst from the same eastern outcrop to the River Neath towards the west, out of an area of approximately 275,000 acres, 49,000 acres or 17 per cent. only remains unlet.

In the western part of the coalfield, where the coal is largely of an anthracitic nature, the development has been slower, and the proportion of unlet property is greater, owing to the fact that the demand for anthracite coal increases at a slower rate than that for bituminous coal or semi-bituminous steam coal, about 48 per cent. being let. Witness can produce a plan shewing the many mineral areas already now let."

13,473. We will have that for any gentlemen who wants it:

"It is witness's experience that intending lessees have no difficulty in securing what areas they require, whenever they are prepared to undertake developments.

Witness believes that this is the experience in other coalfields, as is evidenced by the very rapid development and extension eastward of operations in Yorkshire and Nottingham coalfield; by the fact that in Northumberland and Durham and in Cumberland practically all areas, where there is any certainty of coal existing, have been taken up.

Witness is not so well acquainted with other fields, but believes the same position to hold good, and even in Kent, at a time when the existence of coal in payable condition was very speculative, little or no difficulty was met with in applicants obtaining what properties they required for exploration purposes.

In witness's experience a mineral lessor is only too ready to let, provided he can obtain what he is advised are fair and reasonable terms.

The present procedure of securing mineral properties by an intending lessee, if the parties are prepared to be reasonable represents no difficulties, and is both effective and fairly rapid. An applicant ascertains who a certain lessor's mineral agent is and applies for terms of the property he wishes to secure, a meeting or meetings is or are arranged and in witness's experience little difficulty is usually met with in agreeing upon what are reasonable terms; when these have been agreed, the agent refers them to his client, and in 99 cases out of a hundred the latter follows his agent's advice, and the solicitors are instructed to draw up the necessary documents.

The rate of development of a coalfield is governed by the state of and prospects in the coal trade at the time and not in any way by the difficulty or otherwise in securing leases of mineral properties.

The fact that there have been several periods of depression in the coal trade, due partly at least to over-development, goes to prove that mineral properties have been brought into operation before the demand warranted it, and that the nation has not suffered from any difficulty in getting minerals developed as soon as they were required, although held by private owners.

Witness does not believe that State ownership of minerals will lead to any more rapid development of the mineral resources of the country, as his view is that the real factor governing development is the prospect of obtaining a remunerative return upon the capital to be laid out, and this will vary according to the state of the trade.

Witness's experience is that during and after times of high prices in the coal trade mineral properties are more rapidly taken up than when the trade has been or is at a low ebb.

It would not tend to economy or full employment to force the development of mineral properties earlier than the time at which the coal to be produced from them could be readily absorbed.

Objections urged against the present system of private ownership of minerals are that in certain ways it may and does in some cases lead to waste of coal.

Witness is a member of a sub-committee of the Land Acquisition Committee, presided over by Mr. Leslie Scott, K.C., who have been considering this phase of the question, and the best method of meeting any difficulties which may arise under the present system, and an interim Report upon the subject has already been presented to the Minister of Reconstruction.

6 May, 1919.]

MR. WESTGARTH FORSTER-BROWN.

[Continued.]

Witness begs to refer to this Report, which sets out the difficulties which sometimes arise under the present system, and the method suggested of meeting them."

13,474. Is that the interim report?—Yes.

13,475. If desired, I will ask the Minister of Reconstruction if we can have it:

"Although the list of possible difficulties is long, witness would emphasise that in his experience they seldom arise. The Committee's object, however, was to endeavour to ascertain all possible difficulties and provide a means of overcoming them when they did arise.

For example, difficulties occurring under par. 5, sub-section (i), (iii), (vi), (vii) and (ix) in the Report, which may be classed as difficulties due to unreasonable lessors, are, in witness's experience, exceedingly rare, and it only requires some simple procedure such as is suggested of an impartial Tribunal to prevent them occurring. In fact, in witness's view the very fact that such procedure was available would prevent any difficulty arising from these causes, and the services of the Tribunal would not be called upon, except in cases where what may be termed a legitimate difference of opinion as to the value of a property for letting arose."

13,476. What is sub-section (1)?—"In some cases owners have restricted development on grounds which are either wholly unreasonable, or, although perhaps reasonable from their point of view, contrary to the national interest."

13,477. What is No. 3?—"Where the ownership is distributed in a number of small estates or where the minerals are owned by tenants in common, it sometimes happens that one or more owners refuse permission to work on any terms, or endeavour to enforce exorbitant demand or cannot be found, with the result that the area becomes landlocked, and if it is too small to justify the sinking of a separate shaft, the minerals are permanently lost."

13,478. The first is unreasonable owners; the third is multiplicity of owners and some which cannot be found. What is No. 6?—"It is sometimes difficult for a mine worker to obtain on reasonable terms wayleaves both above and below the surface. The mine worker in order to work his mine efficiently and economically—as it is in the national interest that he should do—requires rights of access on the surface to railways, canals, highways, etc., and below the surface the right to bring coal, etc., from the mines of one lessor through the mines of another lessor. If such rights or wayleaves are denied to him or are only obtainable on unreasonable terms, the economical development of his mine is impeded, or the cost of production unduly swollen."

13,479. Now, what is No. 7?—"It is not infrequently difficult for a mine worker to obtain on reasonable terms other surface rights which are necessary to the efficient working of a mine; as an instance, a mine worker may have an insufficient area of surface ground for dumping his colliery refuse or other waste products, and as the working of the mine proceeds he will be seriously handicapped unless he can obtain reasonable facilities at a reasonable price."

13,480. Now No. 9?—"Cases arise where, owing to unforeseen circumstances, a colliery company or other mine worker is unable to continue the working of the mine, or certain seams in the mine, unless some modification or re-adjustment is made in the terms of the original bargain between the parties concerned. In such cases the minerals may be lost to the nation."

13,481. I will go on now with your proof:—

"For example, difficulties occurring under par. 5, sub-section (i), (iii), (vi), (vii) and (ix) in the Report, which may be classed as difficulties due to unreasonable lessors, are, in witness's experience, exceedingly rare, and it only requires some simple procedure such as is suggested of an impartial Tribunal to prevent them occurring. In fact, in witness's view the very fact that such procedure was available would prevent any difficulty arising from these causes, and the services of the Tribunal would not be called upon, except

in cases where what may be termed a legitimate difference of opinion as to the value of a property for letting arose.

The difficulty suggested as arising under (ii)."

That is where there are a number of small owners?—"Unless the owner has had control of a sufficiently wide area and been gifted with adequate foresight and wisdom in himself and his advisers, there has been no general plan of mineral development proceeding on a scientific study of the geological conditions of an area as a whole."

13,482. "The difficulty suggested as arising under (2) can be readily met by a provision that plans of new development shall be submitted to the Mines Department, which, witness assumes, will be set up, with power to go before the Tribunal in the event of their not approving the plan, and being unable to get the would-be adventurers to agree to their proposed modifications." "Again the question of coal unnecessarily left in barriers"—what is your view with regard to coal left in barriers?—Shall I read the provision?

13,483. Certainly?—"Coal is often left in barriers on the boundary of a mine to prevent the inrush of water from other workings on a higher level. The total area of minerals left in such barriers is very large, and we are satisfied that a comprehensive survey of existing barriers would show that a considerable portion could be worked with safety. But mine managers hesitate themselves to take the risks, because, apart from the danger to life which would arise in certain cases if a mistake were made and a passage thereby opened for the ingress of water, the expense of pumping may easily eat the profits of the mine and even render a large area of mines on a lower level unworkable, and give rise to immense claims for compensation at the instance of the parties interested in those mines."

Sir L. Chiozza Money: It seems to us it is very difficult to examine this witness without these papers which are being quoted to us, especially as Mr. Leslie Scott, who was Chairman of this Committee, has accepted a brief for the royalty owners in this matter and attends these proceedings. It makes it very difficult, especially as he and the witnesses have semi-official information which is not in our possession.

13,484. *Chairman:* I am going to have that circulated. I anticipated this question about Mr. Leslie Scott would arise. I will ask with regard to it. Then the witness goes on:—

"Again the question of coal unnecessarily left in Barriers (v) can in witness's view be best dealt with by a Mines Department obtaining a survey of all barriers and getting out a scheme of re-arrangement, giving all parties likely to be affected a chance of being heard before the Tribunal."

13,485. I think our new Commissioner, Sir Adam Nimmo, was a member of this Committee?—Yes.

13,486. So we have Mr. Leslie Scott and we have the pleasure of yourself and Sir Adam Nimmo as one of the Commissioners: "Any difficulty arising under the other headings except (4)"—what is (4)?—(4) relates to the surface: "It often happens that the owner of the surface has not parted with his legal right to the support of the minerals underneath the surface of his land and also under adjoining land. Removal of any appreciable proportion of the minerals—certainly of the least proportion which would be commercially profitable—inevitably causes some subsidence, and subsidence extends not only to the surface vertically above the minerals so worked, but also to the adjoining surface for some distance away. In such a case, apart from his liability for all damage caused to the surface by such subsidence, the mine worker is liable at any moment to an injunction restraining him from working at all, if subsidence is threatened. There are also cases where, although the mineral worker has the right to let down the surface, he can only do so on payment of all damage caused, and in such a case, fearing the risk of subsidence causing greater damage than the profits to be got out of the minerals, he leaves them unworked. In all such cases the minerals so left are for the most part permanently lost to the nation."

6 May, 1919.]

MR. WESTGARTH FORSTER-BROWN.

[Continued.]

13,487. The witness goes on:—

“Any difficulty arising under the other headings, except (iv) require investigation into the merits of the cases and could be readily dealt with by the Tribunal suggested.

Any difficulty arising under (iv), i.e., difficulties between the mineral worker and the surface owner would, the witness thinks, be intensified if the State became the proprietor of the minerals, as there would be a greater severance of interests between the surface and minerals. At present over very large areas the surface and minerals are in one hand, and as it is generally the case that the working of the minerals is of more value to the owner than the maintaining of his surface, little difficulty arises in these areas, but when the surface has become severed from the minerals, the surface owner requires protection. It is suggested by Mr. Leslie Scott's Committee that this latter difficulty can be best met by vesting in the Sanctioning Authority power to authorise working under such surface if after an investigation of the facts they consider it in the public interest, but at the same time ensuring that the surface owner shall be fully compensated, and to provide for this they suggest an insurance scheme to which all parties benefited by the release of the minerals in question should contribute.”—At the end of that paragraph I should like to add the words, “and guaranteed by the State.”

13,488. Your *précis* goes on:—

“The procedure suggested is shortly to set up an impartial Tribunal, who shall have power whenever it is in the national interest that any rights of user or working, or even ownership, should be obtained in either surface or minerals, including rights of working minerals in certain exceptional cases, the right to let down the surface, rights of way, or any right in, over or under land, to grant a compulsory Order, subject to just compensation being paid to the parties affected.

Under the procedure suggested, any difficulties which may occasionally arise can be readily dealt with, and it would not be necessary, so far as any question of waste of coal is concerned, to bring about so far reaching a change as nationalising mineral rights for what in witness's opinion are only occasional difficulties, and ones which have had no appreciable effect in retarding the full development of the country's mineral resources.

Witness agrees that these difficulties could be largely done away with under a scheme of nationalisation, but upon the assumption that the minerals were all in the hands of the State, there are one or two points which would require to be considered.”

13,489. I want to stop there. The Commission has asked me in the case of the witnesses for the royalty owners to ask questions independently. I gather from what you say with regard to these mining royalties there are certain difficulties of the character you have already indicated, that is to say there are difficulties where you get unreasonable owners?—Yes.

13,490. There are difficulties where you get a number of owners who cannot be found?—Yes.

13,491. There the difficulties with regard to barriers and there are difficulties with regard to drainage, and so forth. In your view are those difficulties that could be met, and satisfactorily met, if you had some tribunal which could order people with a view to compensation to meet those various difficulties, either by in one case letting the land be taken with proper compensation, or making provision for drainage and removal of barriers, and so forth?—That is so.

13,492. You think it would be unnecessary to fly to nationalisation as a remedy for these various evils which could only be dealt with in your opinion by a tribunal and which really do not exist in any great degree?—That is so. I would rather put it this way. Given two alternatives which are going to accomplish exactly the same thing I would take the alternative which was going to cause the least disturbance and the least amount of experimenting as being the sound one to follow.

13,493. I put these questions to you at the request of the Commission, independently?—Yes.

13,494. The witness goes on:—

“For instance, in the event of the mineral worker being in financial difficulties through bad trade or disturbances underground, and where the prospect of his being able to survive was doubtful, he would be placed in a worse position under State ownership than under private ownership.

Witness's experience is that the first thing the proprietors of an undertaking so situated do is, to apply to their mineral owners for concessions in their rents and royalties. The lessors usually meet them as far as possible as they take the view that if they allow the undertaking to go under they will get no income from it, whereas by granting them concessions they may induce them to work on, and the concern may pull round. It is to the direct interest of a private lessor to keep an undertaking, from which he derives revenue, alive if he can.

If all the minerals belonged to the State, the granting of a concession in such a case might not be advisable, as it might be taken as a precedent in other cases and prejudice the revenue from other undertakings and cause a greater loss to the Government than letting the original undertaking go under.

The difficulties which may arise owing to the greater severance of mutual interest between surface and minerals, witness has already referred to.

Witness is not in a position to express any view from a financial point of view of a proposal to nationalise minerals.

Summing up, witness's view is that the difficulties which occasionally occur under the existing system are minor ones and do not call for so drastic a change as nationalisation in order to surmount them; that the private ownership of minerals cannot be shown to have interfered to any appreciable extent with the free development of the country's coal resources.”

13,495. The last paragraph, which you have put so clearly in four or five lines, is the gist of your evidence?—That is so.

13,496. I will read it again:

“Summing up, witness's view is that the difficulties which occasionally occur under the existing system are minor ones and do not call for so drastic a change as nationalisation in order to surmount them; that the private ownership of minerals cannot be shown to have interfered to any appreciable extent with the free development of the country's coal resources.

2. If nationalisation of mineral rights is decided upon, the method of compensation to be adopted.

Upon the assumption that the Government decide to nationalise mineral rights, the fairest method of arriving at the just compensation to be paid to the interests involved would be, in witness's opinion, to appoint a valuer or valuers upon each side to value the different estates, with power to go before a Referee in the event of their being unable to agree.

Such valuation to include the value of unlet or undeveloped properties.

This question has not been considered by the Land Acquisition Mining Sub-Committee, and the above suggestions are entirely witness's own.”

13,497. That is Mr. Leslie Scott's Committee, the one you have spoken of?—Yes.

“As the State would be the purchasers, the costs of valuation and transfer should be borne by them, except possibly in cases which go before the Referee, and in which the ultimate decision shows the vendor to have asked an extravagant price, i.e., the Referee to have a discretion in awarding costs.

In witness's experience the usual basis of valuation of mineral properties producing royalties, certainly in South Wales, is to value the income derivable and to be derived upon the 8 per cent. table, which is equivalent on a long term to 12 to 12½ years' purchase.

In the case of properties producing certain rents only, rents for colliery surface, &c., which are not subject to the geological risks or variation in income to which incomes from royalties are, then at 15 to 16 years' purchase.

6 May, 1919.]

MR. WESTGARTH FORSTER-BROWN.

Increased percentage heavy type.

13,498. Do you desire to add anything to what you have been good enough to tell us?—I do not think so.

13,499. Mr. Robert Smillie: You were a member of the Land Acquisition Sub-Committee?—Yes.

13,500. Sir Adam Nimmo was a member of that?—Yes.

13,501. Mr. Leslie Scott was Chairman of it?—That is so.

13,502. Do you know whether or not there was a person upon it representing the interests of labour?

Chairman: I will read the names—Mr. Leslie Scott, K.C., M.P., Chairman; then yourself, Mr. Forster-Brown; Mr. Comyns Carr, Mr. J. Inglis Davidson. Who is he?—He is from Scotland.

13,503. Sir L. Chiozza Money: What is his occupation?—A surveyor, I think.

13,504. Chairman: Mr. Dixon Davies. He is the solicitor to the Great Central?—Yes.

13,505. Mr. Ellis Davies?—He was a Member of Parliament; I am not sure whether he is now.

13,506. Is he a miners' agent?—No.

13,507. Sir Robert Elliott-Cooper?—An engineer.

13,508. Mr. George M. Freeman, the well known Parliamentary Counsel; Sir William S. Haldane; Sir William Middlebrook, M.P.; Sir Adam Nimmo; Sir Thomas Ratcliffe-Ellis; Mr. C. E. Rhodes and Sir Arthur T. Thring?—I think the original Committee included Mr. Walsh, but he did not attend.

Chairman: Then there was Mr. Eustace Davies, the Secretary, and Mr. Bernard H. Drake, the Assistant Secretary.

Sir L. Chiozza Money: Who appointed the Committee, may I ask?

13,509. Chairman: I think Sir Auckland Geddes.—I cannot tell you.

Chairman: I will get the Report, if possible, by to-morrow.

Sir L. Chiozza Money: Are we to have the advantage of the evidence of Mr. Leslie Scott, the Chairman?

Chairman: That I cannot tell you. Mr. Leslie Scott is not here; I do not know; perhaps he will go into the box.

13,510. Mr. Robert Smillie: I understood the Interim Report has not yet been presented to the Government?—It was sent in March to the Minister of Reconstruction.

13,511. It has not been accepted?—I do not know what you mean by "accepted".

13,512. It has not been published?—I believe not.

13,513. That was a Committee appointed by the Minister of Reconstruction?—I presume it was; it was through the Minister of Reconstruction I was appointed.

13,514. Sir Auckland Geddes was not Minister of Reconstruction?—I think it was Dr. Addison then.

13,515. It is perfectly clear no representative of labour was on that Committee?—I believe there was one appointed, but he did not attend.

13,516. Was there any of them who signed this?—No.

13,517. I think they were chiefly mining men, or largely interested in mining? No, largely Counsel and Solicitors—in the majority.

13,518. Do you think the miners or mine workers in this country ought to have been included in the list on the question of acquisition of land?—I think that was provided for by appointing Mr. Walsh.

13,519. He certainly has not signed the Report?—He certainly has not signed the Report. He did not attend. He was one of the original Committee.

13,520. Is not the appointment of a Committee of that kind at any time under any such a question usually the outcome of discontent prevailing—things are not right?—I should say that under a scheme of reconstruction the Minister was anxious to go into all these questions and to find out the best means of dealing with a big industry.

13,521. You have a very wide experience in mining as a mining engineer. I put it to you that the appointment of this Committee was really the outcome of years of agitation against the present system; was not that so?—I could not say that. I do not know what the Committee was appointed for.

13,522. Have you ever known the Government appoint a Committee for nothing?—I do not know, I am sure.

13,523. What is the use of fencing with the thing. You know the Government never appoints a Committee unless there is a reason?—It may be so.

13,524. It may be so, but is it not so?—Partly.

13,525. Do you know of a Committee or Commission being appointed to deal with mining or land questions which is not the outcome of agitation?—That is so, no doubt.

13,526. As a matter of fact, in your *précis* you say the present system of private ownership of mineral rights has not, in your opinion, interfered with the

6 May, 1919.]

MR. WESTGARTH FORSTER-BROWN.

[Continued.]

free development of the mineral resources of the country, and yet here in several paragraphs you point out where the present system was interfered with?—I point out that there is difficulty occasionally arising under the present system, but that has not actually had any appreciable effect on the development of the country's resources.

13,527. Your statement is not appreciable at all. The present system, the private ownership of mineral rights, has not, in your opinion, interfered with the free development of the mineral resources of the country?—In summing up I say appreciable effect.

13,528. You make a statement it has not any effect; it is not interfered with?—That is a matter of opinion. One cannot exactly say that.

13,529. You are a member of a Committee that was appointed. If, in your opinion, it did not interfere, would there be any use for the Committee, or any call for a Committee, if the present system had not interfered?—You are putting two different things to me; one, the free development of the country's resources; the other, the waste of coal. This Committee was appointed particularly from the point of view of waste of coal.

13,530. Was there not another Sub-Committee dealing with waste of coal which you served on?—I did.

13,531. Was this Committee we are now speaking of appointed after that or before that?—It was appointed afterwards, with a view of finding the machinery to carry out the proposals arising under the Coal Conservation Report.

13,532. I put it that the Committee you are speaking of was not appointed to deal with the waste of coal at all. Its name indicates what it was appointed for?—Which one are you referring to?

13,533. The Committee presided over by Mr. Leslie Scott. It was not appointed to deal with the waste of coal, but land acquisition?—It was appointed to deal with certain difficulties pointed out by the Coal Conservation Committee.

13,534. Its business was not to deal with waste of coal?—To provide machinery to prevent waste of coal; to provide the legal machinery necessary to prevent waste of coal.

13,535. The Mining Sub-Committee was not appointed to deal with waste in working of coal?—It was appointed to provide the machinery to prevent waste of coal.

Sir Arthur Duckham: May we have the Terms of Reference?

Chairman: I will try and get copies.

13,536. *Mr. Robert Smillie:* You were of opinion when you wrote out the first part of your *précis* that the present system of private ownership had not interfered with the free development of the mineral resources of the country?—That was my opinion.

13,537. You devote several paragraphs in the latter part of your *précis* to prove that the present system did prevent the free development?—The free development of the resources and waste of coal are two different questions.

13,538. The free development and the waste of coal are?—Yes.

13,539. We need not deal with the waste of coal now. You say it did not interfere with the free development?—That is my opinion.

13,540. Yet you deal in your *précis* with cases where it did interfere with free development. That Committee was appointed to endeavour to get the right to haul coal over the surface of landlords' property from one property to another?—That is so.

13,541. Interference with that had been common, had it not, by the refusal of the landlords situated between two properties to allow coal to go over the top of their ground?—There may be occasional cases of that sort.

13,542. Do not you know there has been many, many cases?—No, not in my experience.

13,543. Of refusing unless a wayleave sufficient was paid. Have you only known of two, three or four cases in your mining experience of that kind?—I have seldom known a case where a wayleave has been refused or of a colliery not being able to gain access to railway or canal.

13,544. Then why was it necessary to appoint a Committee to endeavour to make it easier to secure that?—It is a possible difficulty and it has occurred, and it was with a view of preventing it in the future.

13,545. It has also occurred underground; the refusal of landowners on the surface to allow coal from one mining property to be taken through his land underground to another mining property?—That may be so; in my experience these cases are very occasional.

13,546. You mean in your own experience?—That is all I can speak to.

13,547. You do not know historically it has been refused again and again in this country?—That it has been refused, I know, but not often.

13,548. That was one of the reasons for the appointment of that Committee?—Yes, probably.

13,549. If it has been refused even in one case, was not that private ownership of the minerals interfering with the development of the mining industry?—I do not think it would interfere permanently with it; it might delay.

13,550. You do not say permanently at all here. It says did not interfere with it. Now you say you have known cases or a case where a landlord has refused. Did that refusal interfere with the mining industry?—I do not think it has interfered with the development of the colliery. It may have led to coal being left for the time being.

13,551. Might it not make it so that the coal had to come out by a different road altogether?—That is possible.

13,552. Is not that interference with the development?—It has not had any effect upon the productiveness of the colliery industry.

13,553. I suppose you are fairly well acquainted with the land of this country?—No, I cannot say I am.

13,554. I suppose you know something about that we may take it?—Yes, something, I suppose.

13,555. I suppose you do know that the land of the country is held by very few people comparatively?—Yes, I have seen that stated.

13,556. It is considerable knowledge if you know that. Do you know the law as to ownership of land in England is the law of England?—In what way?

13,557. When we say "landowners" are we correctly describing persons under the law of England?—I am not a lawyer—I presume so.

13,558. Would you be surprised to know there can be no private ownership of land according to the law of England?—Yes, I should, very.

13,559. Do you know the first thing "Williams on 'Real Property'" says at page 17 is this: "The first thing a student has to do is to get rid of the idea of absolute ownership. Such an idea is quite unknown in English law; no man in law is absolute owner of the land, he only owns an estate in them"?—I think those questions are really questions for lawyers. I am not a lawyer. I cannot answer these questions.

13,560. You are here as a witness to defend the rights of the present holders of the land?—I am here to state in my opinion the private ownership of minerals does not interfere with the free development of the country's resources.

13,561. On whose behalf are you giving evidence?—I am here because the Commission instructed me to come. I have not come on behalf of the mineral owners.

13,562. I understood the Chairman to say Mr. Westgarth Forster-Brown was the first of the witnesses for the mineral owners.

13,563. *Chairman:* If I did say that I made a mistake. I meant we were calling the first witness on the mineral royalty question. I summoned this gentleman. Mr. Pawsey's witnesses will come later on. I made that statement and it was wrong. I meant he was the first witness as to mineral royalties?—My proof was prepared without any consultation with the mineral owners at all and sent on to the Commission.

13,564. *Mr. Robert Smillie:* I know Mr. Forster-Brown sufficiently well to know he has an enormous knowledge of the land question. I have served on Committees with him long enough to know he has

6 May, 1919.]

MR. WESTGARTH FORSTER-BROWN.

[Continued.]

amazingly good knowledge. You are not sufficiently well up in the law of England to agree or disagree with Williams, who is an authority?—No.

13,565. All lands or tenements in England in the hands of subjects are held redeemable or irredeemable for the Kingdom, for in the laws of England we have not any subjects' land that is not so held. That was Cook I was reading?—No.

13,566. Do you know anything what Blackstone says. He says it has been received and is an undeniable principle of law that all lands in England are held mediately or immediately of the King. Would you take it he would know more about that?—I do not know. Probably you would get another book that would give you a totally different view of the matter.

13,567. If a person did not really own the land he would not have a right to let the minerals under the soil?—I always understood that minerals went with the surface.

13,568. Always?—In this country.

13,569. Really that is not so. Not being a witness on behalf of the mineral royalty owners, we must wait until one comes. When you spoke of losses by barrier, you mentioned only the fact that barriers are sometimes left in to keep back water?—That would be on higher ground to prevent the flooding of the lower ground.

13,570. That is one purpose only?—It is the main purpose perhaps.

13,571. Is it really the main purpose?—Undoubtedly, I should say.

13,572. You are a mining engineer of wide experience. Is that the main purpose?—I should say so undoubtedly.

13,573. Has not the main purpose been to leave a barrier between the two landlords estates in order to keep mineowners working the land on one side from poaching on the land on the other side that is owned by a different owner?—I should say certainly not. The collieries leave the barrier on the outside of their taking. In most leases now there is a clause that states that the lessee shall leave a barrier along the boundary of the property where it adjoins another colliery taking, if required.

13,574. You say "now"; that means comparatively new leases?—For many years past. In fact, in South Wales barriers are very often not left at all between collieries.

13,575. Is it a fact that in many cases, in the vast majority of cases, where mines are being worked at the present time and not leases of the last 5, 10 or 15 years, a barrier of coal is left in between two ownerships not because of any fear of inrush of water, but to mark the ownership between the two properties?—I do not know of cases of that sort.

13,576. Do you know where there has been a boundary left in for that purpose?—No, all the colliery takings put the barriers on the outside to protect them against the adjoining colliery, except, I should say, in the Forest of Dean, and there is a reason for that.

13,577. You have not heard, and do not know, of barrier coal, or boundary coal, being left in where there was no thought of inrush of water at all?—There may be very thin ribs occasionally left along the boundary of one colliery taking against another.

13,578. What is a thin rib?—10 yards, perhaps.

13,579. 60 yards; would that be a thin rib?—That is a barrier left for a purpose.

13,580. If that were left in one seam it would be left right down through all the seams?—Probably, yes.

13,581. It might extend for a mile or two miles?—Yes.

13,582. Would not that be a considerable loss of coal?—You might lose a lot more coal by letting the barrier be broken than the loss of coal in the barrier.

13,583. I understood we were speaking of a barrier or rib left in not because of any danger from water but to mark the boundary of the two estates?—I thought you put it at 60 yards thick. I should not say a barrier 60 yards was left to divide the property, but left for water.

13,584. If it can be proved there were such things, would not that mean an enormous amount of coal?—It would depend upon the extent. It would mean a loss of coal, undoubtedly.

13,585. Supposing you take a barrier 50 yards wide, 25 yards on each side of an imaginary line, which is the boundary and which extends for two miles?—Yes.

13,586. Not in a straight line, and that it refers to four or five different seams of coal 30 feet thick in all, would not that be a considerable amount of coal?—Undoubtedly.

13,587. If you knew of such a thing, would you change your evidence and say there had been interference to some extent in the development of the coal?—No, I should say the amount of coal need not interfere with the development of the mining industry.

13,588. A mine manager cannot develop his colliery as he should if he has to leave a barrier?—If it is on the boundary his barrier does not interfere much.

13,589. Would it not be preventing working?—So as not to work into the adjoining colliery.

13,590. I will put it in a simple way. Suppose there are two landlords of the collieries beside each other, and there are to be pits sunk to develop both the collieries, would it not be better if there was only one pit and the management had to deal with the one pit?—I should have to know the circumstances before I gave an opinion upon that.

13,591. I doubt that very much. I think you can give an opinion upon that matter. There are other things besides barrier coal that sometimes prevents the development of the industry. There is the letting of small coal underground; is that according to some leases?—Leases provide that all merchantable coal shall be brought out, but the property shall be worked according to the best practice of the district in which the coal is being worked. If the coal is not merchantable the lessor cannot claim his royalty or cannot claim it shall be brought up.

13,592. When you say private ownership of the mines has not interfered with the development, if you were told that a lease of mineral property was given to a mine owner and he was told he could not sink a shaft within three miles of the mansion house of the owner of the mine, would that be an interference?—It might or might not. It depends entirely on the circumstances and whether there is as good a site elsewhere to work the property.

13,593. Does the site mean everything? If you have to haul your coal three miles instead of one mile or half a mile, what then?—If those are the circumstances—it is an assumption. You may get a site as good and as near a railway as the original site.

13,594. Take the assumption for the moment that it has been put into a lease that the mine owner is not to be allowed to sink a shaft nearer than three miles from the mansion house and the coal extends almost up to the mansion house and the railway facilities would have been a good two miles nearer the mansion house, would not that be interference. You would prefer hauling coal a mile rather than three miles?—Undoubtedly that would be interference with the development of that particular area. It would not have an effect upon the general development of the industry. Mr. Leslie Scott provides a means for getting over such questions.

13,595. There was a Committee appointed to get rid of the things you say have not interfered with the development?—Yes.

13,596. Suppose you were told that one extensive owner of the minerals let the ground to a mine owner to sink and develop that mine on the conditions that his chimney was not to be raised to a height that the smoke could be seen from the top turret of the castle three miles away, would that be interference?—Not necessarily. That lessee might make some other arrangement.

13,597. Supposing you have to put in a forced blast; is that interference or not?—It is a very modern practice. People are inclined to go in for forced blast where there is no restriction of that kind.

13,598. If he got leave to withdraw the forced blast and could build his chimney higher, would you say there had not been interference with the working of that mine?—I do not think it would affect the general colliery industry of the country; it might interfere with that particular area.

6 May, 1919.]

MR. WESTGARTH FORSTER-BROWN.

[Continued.]

13,599. You say the private ownership of minerals has not interfered with the development?—Yes.

13,600. Suppose you knew of a lease being granted and in the centre of the coal-field there was a large mansion house and 400 acres of the part in the centre of the field had to be left, would that be interfering with the development of that coalfield?—I should say that was waste of coal.

13,601. I put it to you, as a mining engineer, that is an interference with the development?—It might or might not be. If the colliery could be developed in some other direction it might not affect the result, although it might waste coal that might be got.

13,602. Suppose a colliery worked the coal all round about the 400 acres in the centre, would not that be a serious interference with the development?—A serious waste of coal, I agree.

13,603. Supposing it was laid down in the lease there was to be a dead rent of £2 per acre per year and it applied to that 400 acres which were never to be taken out, is not that a serious interference with the development?—It would be a hardship on the colliery lessee.

13,604. What is the difference between hardship and interference with the development?—It may be a totally different thing. He may get his output from elsewhere and still pay his dead rent of £2 an acre on this particular coal.

13,605. Mining must be an amazingly profitable proposition if a mine owner has to pay £800 a year in dead rent on coal that is there but he is not able to take out. That £800 would otherwise have gone to the shareholders to provide wages with. Is not that a serious interference?—I have never come across such a case.

13,606. Suppose you take it that such a thing exists, would not that be a serious interference?—I say it would be a serious waste of coal.

13,607. Suppose a case was brought to your notice in which the concern had reached the break of its lease and the owner of the minerals wanted one half-penny a ton more and the owner of the mine refused to give it and the mine had to be shut down; is that an interference with the development of the coal trade because of the action of the private ownership of the minerals?—If that is so, it would be so.

13,608. Would it be an advantage in any case that you know of, from the point of view of drainage, if the colliery had been in the possession of one owner as against five or six, and the drainage could have taken place at the lowest part of the mine; might it not be an advantage in some cases to drain to the lowest point?—That may be so. Mr. Leslie Scott's Committee provides a means for doing that.

13,609. Exactly, proving there was a serious interference because of the private ownership of the minerals?—I do not agree with the word "serious." There may have been interference. I do not consider the cases are serious.

13,610. When there has been a lawyer and a Member of the House of Commons appointed Chairman of a committee with regard to those conditions you say he was appointed to inquire into something that was not a serious interference?—I do not consider the thing sufficient to be serious.

13,611. You wasted your time along with others dealing with something that was not serious?—That is so if it was so.

13,612. What would be the disadvantage of the State owning all the minerals instead of probably 600 or 800 people? What would be the disadvantage of common ownership as against private ownership?—One disadvantage would be the letting of minerals would on the whole be slower. The carrying through of the granting of the leases, and so forth, would be slower under the State than under private ownership.

13,613. Would that be because of the want of capacity on the part of the State?—No, I put it this way. Now you have the maximum of decentralisation with regard to which each mineral owner is responsible for his own property, and he can Yes or No, and it is probably done in a very short time. Under the State you would have the maximum of centralisation, and it must lead, so far as my infor-

mation goes, to a certain amount of congestion. A Department must necessarily, I suppose, be responsible to Parliament, and they could not carry the thing through as quickly as the private owner can now.

13,614. With regard to the payment of the present holders of mineral royalties, in the event of the State taking them over, you propose not only should the State pay for the minerals which are known as far as they can be known to be there, but for minerals which may be supposed to be there?—I am suggesting that where minerals are known to exist, that they are taking everything that could be paid for.

13,615. How would you ascertain it? You propose there might be a valuer, or two valuers, and, failing a settlement, there might be an Umpire?—Yes.

13,616. What line would the value take; would it be the first output or the extent of unworked minerals?—On this basis you would estimate what the minerals are which are likely to be developed and got, and what output you would expect and defer it to the time it would be likely to arise. When you get to the undeveloped property you can hardly call it a valuation; it is an estimate of what the value may be.

13,617. That is where minerals are being worked at the present time?—I am referring to property where minerals are not being worked.

13,618. Where not touched at all?—Yes.

13,619. Where they have bored and proved it?—Not necessarily. They could be known geologically. You know sometimes the coal is there although you do not bore for it.

13,620. If you have not bored you may guess some of the seams are there, but do you know?—You cannot see into the earth, I admit.

13,621. Mining engineers sometimes have believed there are minerals there because they were in the vicinity of other people's minerals and everything indicated they ought to be there, but they are not there?—Yes, that is possible.

13,622. How would you value these minerals that might not be there?—You must take the rough with the smooth. You must estimate. If the chances are the minerals are there, in the ordinary course you would value them now for the increment value and you would place a value upon them although you do not know actually the minerals are there.

13,623. You would pay the persons for minerals that might not be there?—You would take the chance.

13,624. Would you say that the valuation should extend to all the land in Great Britain and we should pay all the landlords because there might be minerals under the ground?—You would not pay if there were no minerals there for geological reasons.

13,625. Would you pay them for minerals that might never be developed if left in their hands?—If there was a reasonable probability you would have a valuer, both for the Government and the private owner, and, if they both agree to the probability of the minerals being there then it ought to be paid for.

13,626. You are speaking of the State doing that. Would Mr. Forster-Brown do that as an individual?—Yes, I might.

13,627. And a business man?—If I had a valuer on the opposite side and if we both agree to the probability of minerals being there I should expect to have to pay for it.

13,628. I put it to you, supposing you are going to nationalise the lands of this country or the minerals of this country, you yourself personally, would you be prepared to put a certain price on minerals in the ground that have never been proved and it is not known if they exist at all?—If I could agree that the probabilities were that the minerals did exist I should be prepared to pay.

13,629. Minerals have been discovered in ground where the experts have said there was not any and there could not be any minerals?—That probably is so.

13,630. Do you know it is so?—Yes.

13,631. Again and again?—Yes.

13,632. It has been said that the ground was not mineral-producing ground or coal-producing ground,

6 May, 1919.]

MR. WESTGARTH FORSTER-BROWN.

[Continued.]

but it has produced minerals. You would therefore compensate all the landlords because in spite of the fact there ought to be minerals there and there are not minerals there?—The State would take 20 per cent. of the increased value and the revenue on anything proved for taxation. The State would get something out of it.

13,633. *Mr. Frank Hodges*: You have read very carefully, I suppose, the report of the Coal Conservation Committee?—I was a member of the Committee.

13,634. You went into the question of those barriers in that report?—Yes.

13,635. I think it was agreed in that report that a large quantity of coal, somewhere about 9,000,000,000 tons, had to be deducted from the estimate of the actual amount of coal yet available in this country?—That includes the coal left for support, in addition to barriers.

13,636. It is 9,500,000,000 tons?

13,637. *Mr. R. W. Cooper*: That is not deducted for barriers?—That includes the coal left for support of buildings and so on. The State estimate for barriers is 3,500,000,000 or 4,000,000,000 tons.

13,638. *Mr. Frank Hodges*: That is the coal that is generally described as "Barrier"?—Yes.

13,639. Do you agree with the estimate of the gentleman mentioned in this Report on page 10, Professor H. S. Jevons, as to the reserve of coal in the British Coalfields?—I am simply accepting the Coal Commission which investigated the question as to the quantity of coal in Great Britain. I never questioned that.

13,640. Do you accept it as the most scientific statement yet known of the coal resources of the country?—I think the Coal Commission was the most exhaustive investigation into the coal reserve of the country.

13,641. That was in 1905?—Yes.

13,642. You know Dr. Strahan, in 1912, gave a considerable increase, as compared with that?—I am quite prepared to accept those figures.

13,643. He was a man of great scientific eminence, a great geologist?—Yes.

13,644. Do you accept his conclusions?—I am quite prepared to accept them. I have no figures to controvert his statement.

13,645. I know it is worked out in a footnote at the present annual output, but according to that estimate the life of the coalfield is approximately 580 years?—I do not follow where that is.

13,646. That is on page 10?—Yes, quite so.

13,647. That is longer than the coal has been worked hitherto?—So far as we know, yes.

13,648. Do you say it would be a legitimate charge for 580 years to come, that on nearly 200,000,000,000 tons of coal there should be a royalty for all those subsequent generations to private individuals?—I do not see any reason why it should not. The State has recognised the property in royalties.

13,649. You are not confusing the men who owned the property with the men who worked the property, are you?—I am afraid I do not follow you.

13,650. You say the State has recognised private ownership?—In royalties.

13,651. Because of that State recognition, you think that for the next 580 years these people are necessarily entitled to benefit per ton produced?—I see no adequate reason against it.

13,652. Although they are actually not going to be the producers?—No, except in a few cases, they are not now.

13,653. *Mr. Sidney Webb*: One gets at the end of your *précis* something with regard to the amount of compensation if minerals were nationalised and compensation was paid. You suggest you would value the income at about 12 or 12½ years' purchase?—Yes.

13,654. Was that your estimate for the present time or for five years ago?—It is the basis upon which we have valued compensation up to the present time.

13,655. I suppose as a matter of fact when you capitalise your income it rather depends upon the current rate of interest does it not? There have been changes in the rate of interest?—I think the rate covers that.

13,656. We may take it this was what you were accustomed to before the war?—Yes, and up to the present time.

13,657. Before the war if you gave 12 years' purchase for a royalty income would you suggest it would fetch 12 years' purchase now?—In practice it does.

13,658. It is very extraordinary, when every other income has gone down 25 per cent, that royalties become more safe than they were?—I do not see that at all.

13,659. Do you suggest they have escaped the lot of other good securities? Good securities have gone down 25 per cent. on an average?—Yes.

13,660. Could you tell me what royalty incomes have gone down?—I cannot tell you that. It varies at different collieries according to output.

13,661. You do give an estimate. If you give an estimate to the Commission in this case you can give an estimate of the variations. Do you suggest there has been no variation in capital value?—As far as my experience goes royalties sell for practically the same as before the war, and the Government accepted our valuation on this basis even during the war.

13,662. With regard to the Estate Duty. No doubt you have acted and assisted in making up Estate Duty Accounts?—Yes.

13,663. Do you put in the royalties at 12 or 12½ years' purchase?—Yes, invariably.

13,664. That is not in accordance with other evidence. Does the Inland Revenue insist upon having the same number of years' purchase now that they did five years ago?—I cannot tell what they do. We have valued for probate on this basis rate up to the present time and we have had no difficulty in agreeing with the Inland Revenue on that basis.

13,665. *Mr. R. W. Cooper*: By probate you mean Estate Duty?—Yes.

13,666. *Mr. Sidney Webb*: You say the goodwill value of a given income from royalties has not varied as compared with five years ago and the present time?—Possibly we valued too high before the war.

13,667. You assert to the Commission that the capital value of whatever income is derived from royalties is practically the same now as five years ago?—As far as my experience goes it is so.

13,668. Can you give me an explanation of why that differs from the value of the London and North Western Railway Company's debentures?—All I can say is we consistently valued on that basis, and we have had no difficulty with the Inland Revenue in accepting that.

13,669. It shows how strict the force of precedent is even in private enterprise. Consider the London and North Western Railway Company's Debenture Stock and the income ruling the same. The capital value of that has gone down by 25 per cent. Can you explain why the capital value of royalty incomes should not have gone down for the same reason?—You capitalise the net income for the same year's purchase.

13,670. The practice of your firm has been to continue the same number of years' purchase on a given income all through these five years?—That is so.

13,671. That is extraordinary. What would you propose with regard to mining properties which were not yielding any income, that is to say, coal mines that have not yet begun to yield an income?—Our practice is to make an estimate when we think that income will be derived, and we defer the income until that period on the same table.

13,672. That makes it very much less than the present value?—Undoubtedly.

13,673. You allow, of course, for the fact that in 1909, before the Increment Duty, the State practically confiscated one-fifth of that value?—I do not agree to the word "confiscate."

13,674. That merely means taken to the Exchequer?—I understood there was no question of confiscation. It is a matter of fact that all taxation is levied for revenue.

13,675. The State takes in taxation one-fifth of the future value of all minerals?—Yes.

13,676. You allow for that?—That is deducted.

13,677. If the State were to say they would take two-fifths instead of one-fifth you would put the

6 May, 1919.]

MR. WESTGARTH FORSTER-BROWN.

[Continued.]

capital value lower?—If that was an accomplished fact.

13,678. The difficulty is how we can persuade people it is right to pay compensation when the property is nationalised, when there is no question of paying taxation when the Chancellor of the Exchequer puts a tax on?—I do not follow you.

13,679. Did you, or any of those connected with royalties, to your knowledge make any protest or any demand for compensation after the Increment Value Duty was put on?—I do not think they did. They looked upon it as a revenue charge.

13,680. A revenue charge that deprived them of one-fifth of the value of the property?—In the same way as the Entertainment Tax, and everything else.

13,681. In the same way if the future Chancellor of the Exchequer made that one-fifth into two-fifths there is no case for compensation?—An accomplished fact.

13,682. If three-fifths, no question of compensation? Where would the equity of compensation begin?—If the Chancellor of the Exchequer was to confiscate—

13,683. Confiscation means taking to the Exchequer?—It is confiscation as far as the mine owners are taking it from are concerned.

13,684. That was the case in 1909?—It was a special tax put on the royalties, not because they were royalties, but because the State wanted revenue.

13,685. That is the usual position of the State; they want revenue?—Yes, usually, I think.

13,686. I am anxious to get from you what difference in equity you can suggest between this thing being done by a Chancellor of the Exchequer and a Minister of Mines under an Act of Parliament?—My opinion is it would be a very unjust proposal for the Chancellor of the Exchequer or the State to raise the Mineral Rights Duty out of proportion to other taxes.

13,687. That was what was done when the 1916 duty was put on, when the special shilling was put on mining royalties as apart from several other kinds of income?—Numerous other taxes have been put on that only fall on certain classes of people.

13,688. That perhaps was justification for the tax on royalties and it would be a justification similarly for another tax on royalties?—Not unless taxation had to go up all round.

13,689. With regard to the probability of a general taxation unless the taxation had to go up all round the security of mining royalties is as good as it was?—I rely on the fairness of the State.

13,690. Therefore, I gather from you so great has been your reliance that instead of lowering your value by 25 per cent., as other people have done, you have kept your value to the full amount?—Yes; we valued on exactly the same basis.

13,691. I hope your clients will not be let in.

(Adjourned for a short time.)

Chairman: I have a letter from the Ministry of Reconstruction. I telephoned to the Minister about this Report, and Mr. McNair has received this answer: "Sir, with reference to your conversation with me this morning, I am instructed by Mr. Chrystal to inform you that the Minister of Reconstruction has no objection to the production in evidence by Mr. Forster-Brown of the Interim Report of the Mining Sub-Committee of the Land Acquisition Committee. Further, I am directed to add that the only reason for the delay in publication of the Interim Report is that the Final Report will be available for publication in the course of a few days." I have obtained some copies of that Interim Report, and they will be circulated.

13,692. Mr. R. H. Tawney: I think your general argument is that the private owner is not obstructed in the development of minerals. Is that so?—Yes, speaking generally.

13,693. Does he render any positive service to their development?—In some cases he has developed his own property.

13,694. Are those cases numerous?—Not taking the bulk of the coalfield.

13,695. Would it be true to say that in most cases he does not render any positive service?—Except in those cases.

13,696. In the other cases what exactly is he paid for?—He is paid for his property.

13,697. That is to say the royalty is simply a payment for a private right quite irrespective of any function which is performed or any work that is done. Is that a fair statement?—I think that is fair.

13,698. Do you speak also with regard to wayleaves? In your paper does what you say refer to wayleaves?—I should say with regard to wayleaves that I should differentiate between wayleaves and royalties.

13,699. Does what you say here refer to wayleaves as well?—I am not here to defend wayleaves, if you mean that.

13,700. I only want to get your views. A case has been supplied to me—and I dare say you can tell me if it is accurate or not—in which a particular proprietor makes £14,000 a year for granting permission to a railway company to transport coal along a particular piece of railway in South Wales. I am not concerned with the figures, but if that case, or anything like that case, is accurate, is there any economic or moral justification for it?—I do not know whether in that case the lessor made the railway or anything of that sort originally.

13,701. No, he did not. He obstructed it. The charge which he made was a condition for leave being granted for a railway being driven through an estate of his?—It is legitimate to charge a wayleave in cases where there is interference with the surface.

13,702. It is again a payment which is made on account of property?—Yes.

13,703. Irrespective of any service which is rendered by the owner of the property?—I should say it was.

13,704. Do you think that payments which are made in respect of property, irrespective of any service, from a moral or social point of view are justifiable?—I do not see why, if a man has a property, he should not be paid for it.

13,705. Even if all he does is to put that property at the disposal of somebody who uses it to work it?—Yes; I have always been brought up under that idea.

13,706. Might I take you to page 2 of your *précis*—the last paragraph but one on the left-hand column? I do not quite understand what your argument is there: "Witness agrees that the difficulties could be largely done away with under a scheme of nationalisation," and so on. Then you go on to point out that there is a further difficulty which might arise in the passage beginning, "For instance, in the event," etc. What exactly is your meaning there?—What I mean to say is that a private mineral worker might be placed in a worse position under State ownership of minerals than he would be under private ownership of minerals.

13,707. Because the State might not make concessions to him, do you mean?—Yes, as a matter of policy.

13,708. Is the only assistance which the private mineral owner gives that in times of difficulty he asks rather less than he would otherwise have asked?—Generally that is so.

13,709. Is that not rather a negative form?—No, it is very often a very substantial concession.

13,710. Merely to refrain from asking for what you might otherwise have got?—Yes. I have known many cases where that has had the effect of carrying a colliery on.

13,711. In that passage are you not assuming that the State does not itself work the minerals, or am I wrong in thinking that?—That is on the assumption that the working of the minerals is in private hands.

13,712. On the assumption that it is in the hands of the State itself, your particular objection would fall to the ground?—Yes, undoubtedly.

6 May, 1919.]

MR. WESTGARTH FORSTER-BROWN.

[Continued.]

13,713. *Sir L. Chiozza Money*: I have very few questions to ask you; but I notice that on page 2 of your *précis* this is stated: "Witness agrees that these difficulties could largely be done away with under a scheme of nationalisation." They can be largely done away with. Is that your opinion?—Yes.

13,714. What is the appropriate use of the word "largely" there?—I may have used the word wrongly, but what I meant to convey was that most of the difficulties could be done away with, but that the question of the surface and minerals would not be done away with necessarily.

13,715. As a matter of fact, are the difficulties many or few, in your opinion?—Few, in my opinion.

13,716. Then may I ask why you put your name to this report that has just been circulated to us of the Land Acquisition Committee? Did you sign that report without reservation?—I did.

13,717. Then I would draw your attention to this, that it is there stated that there are 14 different categories of difficulties?—Yes.

13,717A. You may take one here and one there, but there are a great number. In sub-paragraph 7 it is stated: "It is not infrequently difficult for a mine worker to obtain on reasonable terms other surface rights which are necessary to the efficient working of a mine." Do you subscribe to that?—I am afraid that I have missed the word "infrequently." In my limited experience they do not happen often, but it may be that they happen oftener than my experience knows of.

13,718. So that you really ought to have put in a reservation?—I ought to have done so.

13,719. May I direct your attention to sub-paragraph 8: "A mining lease imposes numerous conditions on the lessee as to the method of working," etc. "In some cases these terms unduly hamper the lessee." Would not your opinion also lead you to put a reservation to that?—No; because there are innumerable conditions in a mining lease.

13,720. If there are 14 different categories of difficulties, and you sign this report, is not that entirely at variance with the evidence you have given us?—No, I do not think it is. I say they arise occasionally here and there, and taken altogether they look a long list, but the Committee have laid themselves out to find all the difficulties that are possible and have tried to find a remedy.

13,721. Are you acquainted with all the coalfields in the country?—No.

13,722. Is your opinion formed from one coalfield where those difficulties are smaller than in others?—I know some coalfields, and there are some I know nothing about.

13,723. Is there a minority reservation to this report?—Yes.

13,724. Is it a fact that two of the Committee differed from the Interim Report and found themselves unable to sign it?—That is so.

13,725. Is it a fact that they say: "We are convinced that full development of our mineral resources will never be secured unless the State is able and prepared both to take over and work inefficiently-managed mines and to take an active part by exploration and research in developing new fields"?—Yes.

Mr. Leslie Scott: I submit that the whole of that passage ought to be read.

13,726. *Sir L. Chiozza Money*: The whole of the passage is before the Commissioners. Might I ask you further: you say you have had some experience in relation to the valuation of Death Duties?—Yes.

13,727. Do you give it to us as your opinion that if the State nationalises the mining rights it ought to give compensation not only for proved and worked coal, but even for unproved coal?—Yes, as long as the probabilities of it existing are there.

13,728. You know there are very wide probabilities?—I think it is generally fairly possible to estimate where there is likely to be coal and where there is not.

13,729. Do you know that the Royal Commission of 1905 estimated that there were 400,000 million tons of coal in the unproved fields under 4,000 feet deep?—Yes.

13,730. Do you think that all ought to be paid for if the State takes over the royalties?—I think so.

In each estate, if the probability is that coal underlies it, I think the coal ought to be paid for.

13,731. You say you have had some experience with regard to Death Duty matters. Has Death Duty been paid by these landowners on the improved coalfield?—Yes, so far as I know.

13,732. Could you give us any cases?—I could not from memory. I should have to look it up.

13,733. Do you mean to tell me that with regard to the particular coal of which I am speaking—unproved coal—there has been a valuation for Death Duty purposes and Estate Duty paid to the Exchequer?—I should think so.

13,734. Do you know of your own knowledge?—I cannot remember now.

13,735. If it has not, do you think the State ought to go back and claim duties on it if it has not been paid?—If they are going to pay for it.

13,736. You would agree?—Yes.

13,737. *Mr. Evan Williams*: A good deal has been said about the meaning of barriers, and the purpose for which they have been left, and it has been suggested to you that it would be better if all barriers were worked away, and all water drained to the lowest point. Do you think that is an economical way of working the coal and carrying on a colliery?—I think in many cases that would not be feasible—that the extra cost of pumping would eat away the value of the coal hitherto left; but there are cases where it would be possible to do it.

13,738. In a flat coalfield?—Yes.

13,739. Take the case of the Rhondda Valley in South Wales for instance, where there is a gradual rise to the outcrop for some miles, you know in those cases barriers have been left?—Yes.

13,740. And water has been pumped from different levels along the valley, some shallow and some deeper till you get to the bottom?—That is so.

13,741. Your view is that barriers in that case prevent a greater waste of coal in keeping water from a greater depth?—That depends on the actual circumstances, but in a great many cases it would be so.

13,742. In present practice in working collieries do you know of barriers being left for any purpose other than holding up the water?—I have known of ribs of coal of 10 yards or so along the barrier to prevent question of trespass. They are really left to correct cases of error of survey.

13,743. So that no dispute arises as to the ownership of the coal hereafter?—That is so.

13,744. The Report of your Committee I think claims that all the disadvantages which have been enumerated can be met by the remedies which you suggest better than by State ownership?—Yes.

13,745. You say: "We do not think that any form of State ownership or working would provide as good a remedy for these disadvantages as the remedies which we recommend." That is the Report of the majority of the Committee, or at least 10 out of 12?—Yes.

13,746. The Minority Report says: "While we do not, as at present advised, think that the creation of a gigantic State monopoly in the working of minerals would tend on the whole to greater efficiency, we are convinced that full development of our mineral resources will never be secured unless the State is able and prepared both to take over and work efficiently managed mines, and to take an active part by exploration and research in developing new fields." Does that go to the extent of State ownership of all minerals? Do you read it that this Minority Report advocates the purchase by the State of all minerals?—No. They seem to have some doubt about the efficiency of such a proposal, as I read it.

13,747. So that by your Committee there was no opinion expressed as to the State purchase of all minerals?—No; not that I know of.

13,748. Do you think that the machinery that you propose to set up will be able to deal with, say, unreasonably high royalties and unreasonable way-leaves?—Yes. If it could be shown that those royalties were so high as to prejudice the development or the national interest, then the applicant would be able to go before the sanctioning authority and have them amended.

6 May, 1919]

MR. WESTGARTH FORSTER-BROWN.

[Continued.]

13,749. That is proposed?—That is proposed, but not simply on the ground that they made a bad bargain. I mean the national interest must enter into it.

13,750. The national interest would be the only consideration?—Yes.

13,751. And not the private interest of the coal-owner or the landlord?—No.

13,752. Would that Commission have the right to rectify the boundaries where it was to the national interest between two collieries?—What the Committee propose is that the Mines Department should have a plan of all now developments placed before it previous to the commencement of operations, and that they then be empowered to lay out the areas they think ought to be worked in relation to others, and if the mineral owners would not agree then the Mines Department would go before the sanctioning authority and get compulsory power to make the areas suitable in the national interest, so that no coal should be lost.

13,753. That is not so much to rectify the errors in the past as to prevent errors in the future?—Yes.

13,754. Do you think that State ownership would be able to rectify the errors it made in the past?—No, I do not see that it would, except so far as any barriers have been left which ought to be worked.

13,755. That may still be worked?—Yes. That can either be done by the Sanctioning Authority or by the State.

13,756. So that anything that is left to be done now or in the future may be done under the machinery that this Commission recommends?—That is so.

13,757. Without having all the trouble of the State purchasing the mineral and the State taking the risk of the individual owner?—Yes, that is the view the Committee take.

13,758. *Mr. R. W. Cooper*: Have you before you the print of the Coal Conservation Committee's Report, and, if so, would you look at page 56? Do the first two paragraphs on that page correctly describe the present practice with regard to barriers?—Yes, so far as I know.

13,759. I will read the first paragraph: "According to the evidence given before the Royal Commission on Coal Supplies, 1903-5, the usual practice is to leave barriers round the outside of the colliery taking or area, but not round separate properties included in the area, or if barriers round separate properties are stipulated for they are usually allowed to be worked out, provided the outside barrier between the different colliery takings is maintained." You act for a good many royalty owners I believe. Have you not from time to time had applications made to you by the coal workers for leave to take away a barrier or part of a barrier?—Yes, occasionally.

13,760. If you are satisfied that the coal can be worked without endangering the rest of the colliery do you hesitate about granting leave to work away the barrier?—No, it is the direct interest of the lessor to have his coal worked if it is possible to work it.

13,761. And the lessee as well?—Yes, quite so.

13,762. In the questions you were asked there was some skilful play upon the word "confiscation." There are two duties on minerals imposed by the Finance Act, 1910?—Yes.

13,763. The celebrated Budget of Mr. Lloyd George?—Yes.

13,764. They are both collected under one heading, "Duties on Land Values"?—Yes.

13,765. They are part of the duties or taxes imposed by that Act for the first time, both upon land and upon minerals?—Yes.

13,766. You were also asked a question about 12 years' purchase. Of course, when you are talking about 12 years' purchase you mean 12 years' purchase of the mineral royalty or rent?—Yes; it would depend on the length of life of the particular estate.

13,767. You are not in any way talking about the system of valuing the profit interest of the worker?—No, I am not giving evidence on that at all.

13,768. I understood you to say that since the war began you have been engaged in making valuations of royalty interests for the purpose of Death Duties?—Yes.

13,769. You have settled valuations with the Inland Revenue on the footing you have described?—That is so.

13,770. So far as you know, the State has collected its duties upon that valuation?—Yes, so far as I know.

13,771. *Mr. Arthur Balfour*: I want to understand your position exactly. You agree that wherever consent is unreasonably withheld by royalty owners, whether it be barriers or leases, or whatever it may be, some power should be given to somebody to judge a case of that kind and adjust it in the public interest?—Undoubtedly.

13,772. You agree that can be quite easily done by an impartial tribunal and does not necessarily involve the purchase of the whole royalties by the State?—Yes, I agree to that.

13,773. With regard to the compensation should it be decided to purchase the royalties, you agree, I take it, that unless rights of property in this country are respected no one will wish to deal with this country or invest money in this country?—I think if the country is to live we must treat everybody fairly all round.

13,774. And that no one would want to deal with this country if rights of property are not respected?—I think the basis of everything is confidence.

13,775. You think it would ruin confidence?—Yes.

13,776. And affect the trade of this country?—I think it is probable.

Sir L. Chiozza Money: In view of the difficulties we labour under in asking questions by only having this report put into our hands a short time before, may I be allowed to ask something further?

Chairman: Mr. Smillie wants to ask some questions first.

13,777. *Mr. Robert Smillie*: I suppose you mean the possession of property, when you speak of it being taken from the possessor?—Yes.

13,778. Suppose I came into possession of your pocket book, would you think I should be compensated for it if I had to give it up?—No; I should be inclined to haul you up for having got it.

13,779. I think you made a statement that in some cases it would not pay to pump the water at a low level?—Yes.

13,780. Did anyone suggest to you that in every case it ought to be done?—No.

13,781. I think I did not suggest that in every conceivable case it ought to be pumped from a low level? No.

13,782. But the purport of Mr. Evan Williams' question was that it was suggested in every case that it should be done. That was not the question?—No, I think it depends on the circumstances of the case.

13,783. I think when a 10 yards barrier is left in it is very often not left in to keep out water, but as a barrier between two owners?—Yes.

13,784. Might I take it that where there are 18 feet thickness—perhaps in three seams or four seams—that that would mean where the length of the barrier is one mile a loss of 105,600 tons of coal?—It might be so. I have not calculated it; but I will take it from you.

13,785. One ton to the square yard; and if it were four miles round the outside barrier, which Mr. Cooper speaks of, round the property, it would be a loss of 422,400 tons, or almost half a million?—Yes; but Mr. Leslie Scott's Committee show how it can be got over. An application could be made to the sanctioning authority to have it worked.

13,786. But it would not be lost if the minerals were owned as common property by the State. There would be no necessity for new legislation?—I agree you can do it by State nationalisation, but I prefer the other alternative, because it causes less disturbance and carries with it less experiment.

13,787. I want to suggest to you that it was private ownership that was responsible for the loss of this nearly half a million tons where there was an outside barrier left, and that it is irretrievably lost where the coal is worked out. You would admit that the

6 May, 1919.]

MR. WESTGARTH FORSTER-BROWN.

[Continued.]

outside barrier of the mineral property when the minerals on both sides of that are worked out is irretrievably lost to the nation?—Probably when the coal is worked out that is so.

13,788. When all the coal is worked out but the barrier?—That is so.

13,789. *Mr. Frank Hodges:* In this report that you have attached your signature to I see you have made a series of recommendations from A in the alphabet to P, and I find that you propose setting up under the Home Office a Mining Department for the express purpose of dealing with the most scientific exploitation of mineral properties?—Looking after the conservation of coal is what I have considered one of their duties to be.

13,790. But you contemplate that this machinery should be set up with the existing interests remaining as they are?—That is so.

13,791. So that if more coal is produced because of the more scientific method adopted by this mining department you are incidentally conferring a boon upon the mineral royalty owners?—Undoubtedly.

13,792. Does it not rather suggest that that is the purpose for which this particular department is to be set up rather than in the interests of the country?—No. This Committee was considering these questions long before this Commission sat, and the Interim Report was got out because the Committee felt that the facts they had been going into were germane to the inquiry.

13,793. Is that not the effect of setting up this department, that you would work more scientifically the properties and incidentally earn more money for the royalty owners?—And for the State. The State gets their revenue on those extra royalties.

13,794. The principal benefit from the mineral itself would be to the royalty owners. They are not taxed by half?—No. They get a large proportion.

Sir L. Chiozza Money: I should like to be allowed to ask some further questions on this document.

Chairman: They must be questions only on this Report. You cannot cross-examine time after time.

Sir L. Chiozza Money: I only had this document put into my hands just before I cross-examined.

Chairman: You may ask anything on the document on the ground that you had not seen it before.

13,795. *Sir L. Chiozza Money:* Did you take much evidence to found this Report upon?—No.

13,796. Was this Report written on the personal knowledge of the Commissioners or was it written on evidence received?—Mostly on the knowledge of the Commissioners and the facts found by the Coal Conservation Committee.

13,797. In other words, this is really based broadly on the knowledge that you and your brother committeemen possessed?—Yes—except that we had evidence in one or two cases.

13,798. How many witnesses were heard?—I do not think there were any witnesses on mining matters.

13,799. *Chairman:* I have promised to ask any questions in re-examination of the royalty witnesses. First of all, you are not in any sense a witness for either side here. You are a witness in the nature of an official character summoned by the Commission, and you are not representing either one side or the other?—That is so.

13,800. You were asked by Mr. Smillie some question with regard to surface wayleaves. Do you wish to add anything with regard to surface wayleaves?—My view is that surface wayleaves are often legitimate, because the surface and perhaps the amenities are interfered with, and I think it may be legitimate to make a charge for surface interference by a wayleave.

13,801. They may interfere with the amenities on the remainder of the property?—Yes.

13,802. Then you were asked some questions with regard to Williams on Real Property. Are you a "real property" lawyer?—No, I am not; I know nothing at all about it.

13,803. You were asked some questions with regard to leaving small coal underground. Does that apply particularly in South Wales?—Yes, more largely in South Wales than elsewhere.

13,804. Do you desire to say anything with regard to that point?—The evidence before the Coal Com-

mission, of course, was that it was questionable whether the coal could be dealt with if it was brought to bank, and, of course, so far as the effect on the mineral owners is concerned, the mineral owner has very little control of that.

13,805. Mr. Sidney Webb asked you some questions of this character: He said: Weil, on one occasion the Chancellor of the Exchequer taxed royalties to the extent of one-fifth, and then he asked you whether if he taxed them to two-fifths, would you approve of that; then three-fifths, and eventually, of course, he got to five-fifths. Do you agree with that argument?—No.

13,806. Now, I want to ask you with regard to this interim report. I rather gather that you gentlemen did not have the opportunity of having many witnesses. You had no witnesses before you?—No mining witnesses.

13,807. I propose to draw attention to two parts of the report, which appear first of all in paragraph 7. You say: "In our opinion, the constitutional, legal and administrative changes which we have summarised above, will free the development of the mineral resources of the country from most of the hindrances to which it is liable under the present system of working." What are the influences that it will not free the country from?—I do not know that I can enumerate any.

13,808. Cannot you explain that sentence in your report? I will read it again. "In our opinion, the constitutional, legal and administrative changes which we have summarised above, will free the development of the mineral resources of the country from most of the hindrances to which it is liable under the present system of working." You signed that, and I want you to be good enough to tell us what are the influences that it will not free the country from?—I have read that as referring really to waste coal. There is certain waste of coal which would not be affected, such as the thick coal in Staffordshire.

13,809. "We believe, also, that the disadvantages which we have enumerated as inherent to the present system constitute some of the chief reasons in the minds of many of those who are in favour of nationalisation." What are the grounds of your belief? Had you any witnesses before you?—No. One has often heard these objections urged to the present system.

13,810. Then you go on, "We do not conceive it to be within our province to express any opinion whatever on nationalisation, except from the point of view of the specific questions referred to us." Are those the questions on page 1?—That is so.

13,811. "But, in our opinion, if the disadvantages we have mentioned are remedied by the means which we recommend, the main drawbacks of the existing system, so far as our terms of reference are concerned, will disappear, and the development of the mineral resources of the country will be substantially promoted." You think the present system does want some alteration, because you say the development of the mineral resources of the country will be substantially promoted by your suggestions?—Yes, I certainly think so.

13,812. "And we do not think that any form of State ownership or working would provide as good a remedy for these disadvantages as the remedies which we recommend." Now that was signed by the majority. Then I think Mr. Comyns Carr and Mr. Ellis Davics said this:—"Memorandum by Mr. A. S. Comyns Carr and Mr. Ellis Davies. We regret that we cannot see our way to sign this report, although we are in substantial agreement with the whole of it, except the last paragraph." That is the one that I have just read. "But that appears to us to be altogether too sweeping. We think that many of the results at which we are aiming might be attained by national ownership of minerals, whatever may be said for or against that proposal on financial or other grounds." Did the gentlemen discuss what other grounds there were against the proposal at all?—Not that I know of.

13,813. Was there any discussion of it before your Committee?—I was absent from some meetings towards the end, as I was ill.

6 May, 1919.]

MR. WESTGARTH FORSTER-BROWN.

[Continued.]

13,814. I was wondering what the other grounds were. "While we do not, as at present advised, think that the creation of a gigantic State monopoly in the working of minerals would tend on the whole to greater efficiency, we are convinced that full development of our mineral resources will never be secured unless the State is able and prepared both to take over and work inefficiently managed mines, and to take an active part by exploration and research in developing new fields." That was their view?—Yes.

13,815. What is your view with regard to that last bit of it, if the State is able to take over and work inefficiently managed mines?—It was suggested in

our report that the sanctioning authority should have power in such cases to allow the State to take over mines that were mismanaged in the national interest.

13,816. You thought there were some mines that were so mismanaged that the State ought to take them over, and that other mines which were properly managed ought not to be taken over?—We could conceive of cases; we did not know of cases, so far as I know.

13,817. You had no evidence before you of any?—No, not evidence.

13,818. Is there anything you wish to add to what you have already said?—I do not think so.

(The Witness withdrew.)

Mr. ARTHUR LAWRENCE, Sworn and Examined.

Chairman:

"1. I am a mining engineer residing at Cardiff and have been engaged for over 50 years in mining, chiefly in the South Wales coalfield.

2. I am well acquainted with most of the coalfield, and my work for the last 20 years or so has largely consisted of acting as mineral agent and adviser to certain large mineral estates, amongst which I may mention the Margam Estate, the Duchy of Lancaster, the estate of Lord Aberdare, the Crawshay Bailey Estate, that of Messrs. Gwynne Holford, Lord & Curro and several others. The mineral area included in these estates is about 42,000 acres, with an average annual output of about 5,500,000 tons.

3. Most of the properties I have mentioned are situated in the county of Glamorgan and form some of the most valuable portions of the coalfield.

4. The facts as regards the royalties and wayleaves paid within my knowledge are very simple. In most cases in South Wales a royalty per ton has been agreed between the royalty owner and his Lessees, and until about 30 years ago the payment of an *ad valorem* royalty per ton was rare. In two cases only of those for whom I act are royalties on the *ad valorem* principle paid. The area affected being under 2,000 acres.

5. The average net receipts for royalties of all description received by the Lessors for whom I act work out at 6-29d. per statute ton or only about 2½ per cent. of the cost of production.

6. The average wayleave (where payable) on these estates is 86d. per statute ton. In many cases free wayleave rights have been granted.

7. In the last 50 years there has been no material change as regards the rate of royalties charged and the same remark applies to wayleaves.

8. A certain, or dead, or minimum rent is usually charged at the rate of about £2 per acre per annum. This merges in the royalties. Also a rent for any surface land taken for colliery purposes is usually charged at the rate of about £2 per acre per annum. This does not merge in the royalties.

9. I cannot at present cite a case of minerals now remaining unlet owing to any unreasonable refusal on the part of the landowner. If any such case arose (and similarly with regard to wayleaves) which threatened to impede useful developments, I would suggest that some tribunal be set up to whom the case should be referred.

10. The leading terms of a lease are usually settled by fair bargaining, both parties being interested in effecting a letting, and the general terms, covenants and provisions are now practically standardised.

11. As regards power of the Lessee to determine the Lease, the prevalent provision is that if and when the minerals are exhausted or become soft or unmarketable, or fail after fair trial to be worked at a profit, the Lessee can determine by giving twelve months' written notice. This practically amounts to allowing the Lessee to surrender when he likes, and of this I quite approve.

12. On the other hand I have insisted on the Lessee covenanting in the event of their being unable to work any outlying tract beyond a fault that they

shall surrender such tract to the Lessor and thus enable him to get it won by others.

13. I have read the report of the Royal Commission of Mining Royalties issued in 1893, and I generally agree with its conclusions and recommendations. I think the provision for empowering a Lessee to recover out of excess workings the short workings he has incurred is only fair and reasonable provided that he has made fair attempts to avoid incurring the short workings. I cannot say to what extent any Royalty owner has forfeited such short workings, but I can state positively that this power has never been abused in any instance within my knowledge, and I have in many cases advised the Royalty owner to give the Lessee such an extension of the average clause as would recover these shorts.

14. Another alleged grievance is, I believe, the reluctance on the part of the Lessors to assist their Lessees by concessions or Rebate of Royalties to enable them to pass through difficult states of trade. I have never found Royalty owners reluctant to entertain these appeals, and I can give instances of what I consider very handsome concessions made by Lessors to their mineral tenants which have resulted well for the Lessees and also for the nation as a whole. Such concessions appeared at the time to be scarcely justified on strict business lines, and had the minerals belonged not to such Royalty owners but to the State I venture to think they would not have been advised to make these concessions for fear probably of creating precedents. I may give the following instances of concessions:—

1. In or about the year 1890 the Crawshay Bailey Estate made a concession to Cory Bros., Ltd., in order to assist them through troubles underground by reducing permanently their reserved royalties from 1s. large and 6d. small to 5d. large and 2½d. small.
2. About the same time the same Lessors made concessions to the United National Company to the extent of about £12,000 on account of certain troubles and heavy cost they incurred.
3. About 5 years ago North's Navigation Company received a temporary reduction of 2d. per ton off their royalties, to continue for 3 years.
4. The Brynddu Colliery (upon Miss Talbot's Estate) was surrendered as unworkable at a profit. Miss Talbot, in order to prevent distress in the neighbourhood, carried on the Colliery herself for about 3 years, thereby incurring a loss of over £80,000. The workmen appealed against this, and begged her to continue the working, alleging that they were satisfied it could, should and ought to be worked at a profit. The result was that under my advice she offered them the Colliery as it stood, stock, lock and barrel, at a reduced royalty of 4d. per ton "through coal," and on other terms of a most liberal character. The men, however,

6 May, 1919.]

MR. ARTHUR LAWRENCE.

[Continued.]

failed to take advantage of this offer and the Colliery has since been abandoned.

5. Baldwins, Ltd., have met with a certain amount of trouble and mining vicissitudes at their Bryn Navigation Colliery, and were assisted to the extent of £5,000 by Miss Talbot.
6. Lord Aberdare reduced the royalties on his Middle and Lower Duffryn minerals, leased to the Powell Duffryn Coy., from 9d. per ton to 6d. per ton, and the royalties on all veins below the 9ft. worked by the Powell Duffryn Coy. from the co-owners' property Holford, Lord & Currie (to 6d. per ton), on the ground that the quality and prospects of those seams were not as promising as the upper superior seams.
7. The Lessees of the Bwlfa and Nantmelin Colliery, in the Aberdare Valley, owing to bad times, appealed to their landowners for a reduction of Royalty and obtained very handsome concessions, the present Royalty being, I believe, 5d. per ton; but for this concession it is believed that the Colliery would have been stopped, and as a result it has been a very prosperous concern ever since.
8. Messrs. The Lewis Merthyr Colliery Co. held a property in the Ogmore Valley upon which they had paid about £23,000 in dead rents, which they saw no means of recovering. They appealed to their landowner (Mr. Blandy Jenkins) who, acting under my advice, granted them a lease of adjoining minerals, allowing them to recover the dead rents of £23,000 paid out of excess workings on the newly-acquired property.

15. I have never known cases where mineral owners have refused to grant renewals of Leases (when required by their Lessees to do so) on reasonable terms. I have recently settled and agreed for renewals of large areas of most valuable minerals in the Rhondda Valley to two of the largest Companies in South Wales. In both cases the Lessees accepted my terms without demur. In all cases of renewals of Leases where short workings existed at the termination of the earlier Lease, it has been agreed to allow the Lessees to recover these short workings out of excess workings under the new Lease.

16. It has been suggested that much unnecessary waste is caused by the leaving of barriers of solid coal, but I do not think that much saving would be effected by nationalisation in this direction.

17. Whether nationalised or not, barriers will always be necessary, not only for the prevention of inundation from collieries lying to the rise, but to prevent any interference to the ventilation resulting from the leakage of wind which would result if the collieries or takings of the mining area were not separated by substantial barriers of solid coal. It is true that under the present system the colliery takings are irregular in their outline, and that if against the outside boundary of the takings in all cases a barrier was left, it would be more tortuous and result in the leaving of more coal; but this difficulty is usually, if not generally, obviated by exchanges being effected between taking and taking, both Lessors and Lessees being alike interested in the bringing to bank of all the workable coal.

18. I think Nationalisation is more likely to lead to waste of coal than the present system of private ownership. As at present a Lessee's energies are directed towards realising to the fullest extent all the mineral in his taking and the fact that he is confined to that taking induces him to work coals which, had he full liberty to pick and choose and had further areas to explore, he would not work. In cases where the Lessee craves such exhaustive working it is open to the Lessor to see that in his (the Lessor's) interest the Lessee complies with his covenants in this respect. If the whole coalfield, on the other hand, were in the hands of the State, I fear they would be tempted to work such coal as was most profitable, neglecting the adjacent less profitable coal.

19. Assuming that expropriation is determined upon, I do not think that Part VI. of the Fabian Society's pamphlet sets out properly what would be the fair and proper basis through which to arrive at the compensation to be paid to the royalty owner. It is there suggested that the basis to be taken should be the income obtained in previous years, but I would point out that this is fallacious. Assuming two properties, each containing 1,000 acres of a valuable seam, Property A might, though nearly exhausted, be yielding 1,000 tons per day though the workings are rapidly approaching the boundary. Property B, only recently opened, may have only as yet reached an output of 100 tons per day. Property B, nevertheless would be the most valuable property of the two though, according to the Fabian Research view, the reverse would be the case. I would suggest that the whole of the circumstances of each case would have to be considered on its merits as is frequently done in the barter and sale of this class of property.

20. The existence of royalties, I submit, is a useful fact, as it enables the Lessors to assist those of their Lessees by temporary concessions, such as I have mentioned and such as are constantly taking place. If no such royalties existed at all, certain inferior collieries would look in vain for any outside help, and for such purposes it is perhaps well that the royalty owners are able to accumulate some capital to be applied to this purpose when necessity calls for it.

21. Another objection to the Nationalisation of the Minerals is, in my opinion, that this would bring about naturally a severance of the ownership of the surface from that of the Minerals. If the State became the owner of the Minerals, I foresee difficulties in their working of them owing to the inevitable letting down of the surface, which belongs to the present various owners; presumably this would put the State to huge expense in order to satisfy the surface owners and also occupiers who then would have no direct interest in getting the minerals worked.

22. The Nationalisation of Minerals would inflict a considerable loss of revenue upon the State by reason of the heavy taxation which the present owners are subjected to in the form of:—

- (a) Mineral rights duty.
- (b) Increment value duty."

13,819. Only one other question. You have been asked by the Commission to come and give evidence. You are not appearing for the royalty owners?—No, I am not.

13,820. Mr. Robert Smillie: You say the nationalisation of minerals would inflict a considerable loss of revenue upon the State by reason of the heavy taxation that present owners are subjected to in the form of So and so. Would that not all depend on what the State paid for the minerals if it bought them?—You are referring to the last paragraph?

13,821. Paragraph 22?—I do not see that the taxation you refer to would be augmented or otherwise by the amount they paid for the minerals.

13,822. Are you not assuming that you would pay the value of the minerals prior to the tax being put on when you say it would be a loss to the State taking over the minerals?—What I meant was this, whatever it may be worth, that at present the State obtains a certain amount of revenue by that taxation. That would disappear surely if private ownership disappeared, would it not?

13,823. No, not if the State took over the minerals without paying for them. Would it not gain?—I am assuming that just as the minerals were subject to taxation before nationalisation they would be subject to taxation afterwards.

13,824. Do you mean to say if the State took over the minerals that the State would tax itself every year on the minerals?—No, the State would lose that tax.

13,825. It would all depend on what the State would pay to the present owners?—I suppose it would be involved in that.

13,826. Supposing the State did not pay anything, but took the minerals over, would there be any loss to the State?—I do not quite follow you.

6 May, 1919.]

MR. ARTHUR LAWRENCE.

[Continued.]

13,827. Supposing the present holder of the minerals handed over to the State the minerals, would the State lose by it or gain by it?—Gain by it.

13,828. Then it all depends on whether the State paid, and, if so, what it paid, whether it would lose or would gain? I wonder what you had in your mind when you said the State would lose by taking over the minerals?—The State would no longer get the mineral rights to begin with.

13,829. Would they not get the minerals?—I did not mean that in the gross the State would be a gainer.

13,830. The State would be the gainer, but not so much a gainer?—No. That is the way I think it should be put.

13,831. You give the average royalty on the estates which you manage at a little over 6d. a ton?—Yes.

13,832. For large coal?—No, on through coal. That figure is obtained by dividing the absolute tonnage brought from the mine into the money which the landlord receives.

13,833. A little over 6d. a ton on through coal?—Quite right.

13,834. All kinds of coal?—Yes.

13,835. Under the lease is the mine owner who works the coal on the estates for which you are responsible required to put out small coal?—Not in those precise terms. The lessee undertakes to work the mines on the best and most approved system, and so that the largest practicable quantity of coal should be brought to bank that can be brought to bank profitably.

13,836. As a matter of fact do they fill through and through coal in the collieries on the estates which you refer to?—In some they do and in some they do not. I do not think I could tell you what is the proportion. I may add this, if it is any use to you, that 50 years ago the men were absolutely forbidden to fill small coal, but as small coal advanced in value, the masters at first tolerated and then approved of it, and now in many cases they fill through and through.

13,837. Your royalty of 6½d. a ton is on through and through coal?—That is it.

13,838. Coal might be hand-picked at the face and put into the tubs, it might be large coal at the face, and there might be a proportion of it when it was put into the wagons that was small coal?—It was certain to be.

13,839. Your royalty is put on it at the pit's mouth?—It depends on what royalty is received. In the large number of cases in the biggest estates it is a through coal royalty. I mean large and small mixed together.

13,840. That is, the landlord is paid, for large and small mixed together, his 6½d. price?—Yes.

13,841. Would you be surprised to know that the workmen would not be paid for producing small coal, that their wages are governed by large coal?—That is an involved question, and it is not the first time I have heard that stated. Their wages, it is true, are fixed upon the large, but when that was arranged, it was an understood thing that they should not be paid for small, and any small they chose to fill, or did accidentally fill in, was chucked in, if I may say so. The large coal royalty compounded for that.

13,842. I suppose you, as a mining engineer, knowing the South Wales coal, would not be surprised to know that a man might fill into a tub hand-picked coal, round coal, 10 cwts. to a tub, and it might be found at the surface that there was only 9 cwts. of round coal?—That would be pretty rotten stuff, I take it; I never knew of such a case: that is to say, that 90 per cent. had fallen away from large to small?

13,843. Yes, 1 cwt. out of 10 might be considered small coal at the surface?—That coal might have had some other merit besides its softness.

13,844. My point is that the workmen were only paid for 9 cwts.?—I am surprised that such a coal was worked at all.

13,845. In that case the royalty owners would be paid for 10 cwts.?—In which case?

13,846. In the case of a man filling 10 cwts. of round coal into a tub at the face and it becoming 9 cwts. of round coal and 1 cwt. of small, the mine owner would be paid for 10 cwts.?—If that stuff is called coal and not rubbish.

13,847. And the men would only be paid for 9 cwts.?—I am surprised to hear if there ever was such a case.

13,848. In the case of Miss Talbot, under No. 2, you say: "About the same time the same lessors made concessions to The United National Company to the extent of about 12,000." Do you remember what the royalty rents were?—Yes, they were pretty high: 1s. large and 6d. small.

13,849. Now No. 3: "About five years ago North's Navigation Company received a temporary reduction of 2d. per ton off their royalties, to continue for three years." Do you remember what their royalty was?—That was an *ad valorem* royalty: taking it as through coal, it was nearly 9d. a ton.

13,850. Do you remember what Miss Talbot reduced, or offered to reduce, the royalty from when she offered it at 4d. a ton?—Yes, the previous royalty was 6d.

13,851. And she offered to make it 4d. to the workmen?—That is so.

13,852. All those royalties come out at 6d., or above 6d.?—Those, and a lot more.

13,853. They come out at 6d. and above 6d.?—They come out at 6½d., as you said before.

13,854. But all we have touched up to the present time are 6d., 9d. and 1s.?—I have not calculated what those average, but those with the rest of them, for which I act, make up the figure of 6½d. I will take out those, if you like.

13,855. I was trying to prove that, from the information you gave us here, you have hardly anything so low as what you give as the average?—No, those were among the best. The United National, as Mr. Hodges could tell you, is in one of the best parts of the coalfield; so also is that of Cory Brothers & Company.

13,856. Have you any experience of selling coal yourself to customers and getting orders for coal?—No.

13,857. Do you know anything about the commercial side of the business?—A little, but I am certainly not a commercial man.

13,858. Are you aware that very often there has been a loss on sales in a colliery of less than 3d. per ton: that is, the buyers would not buy because of the difference of 3d. a ton between the seller and the buyer?—Perhaps some local sale might be varied by such a figure as that, but it would not be coal for export or any large contract.

13,859. Do you think that 3d., 6d. or 1s. a ton might not prevent an order being placed?—You go from 3d. to 6d.—3d. would not make much difference.

13,860. Is 3d., 6d. or 1s. considered a small thing in a ton of coal?—In a ton of coal, but not in 10,000 tons of coal.

13,861. Are you aware that the majority of strikes that have taken place over the coalfield have been strikes in which less than 6d. a ton has been involved?—I have been very sorry indeed to hear that strikes have taken place for such small things as they have.

13,862. 3d. a ton to the man who is producing five tons of coal per day perhaps may not be a small thing?—No, if it is a genuine dispute about a ton or two of coal, I should have some respect for the striker, but unfortunately there are frequently strikes and losses of hundreds of thousands of tons for matters almost as little as that.

13,863. It does seem a pity, but there are always two sides, you see?—Yes.

13,864. You say that the present system of private ownership of minerals leads to the owner of the minerals being able to make a concession from time to time if necessary in a badly situated colliery?—Yes.

13,865. Which might enable it to go on?—Yes. I think I had the honour of agreeing with you on that point. I think you stated so yourself in 1893.

13,866. What I stated is this, that sometimes the difference between a 4d. royalty and a shilling royalty

6 May, 1919.]

MR. ARTHUR LAWRENCE.

[Continued.]

enabled the worst situated colliery to go on and not shut up?—That is so.

13,867. That is so obvious to people who know those things. Have you ever heard of an owner of a colliery that was doing well earning, it might be 20, 25 or 30 per cent. dividend on invested capital, giving any help to the owners who had to shut up because they could not do well?—No, I do not think I can ever remember a case of that sort. Do you mean where a successful colliery company came to the help and rescue of an unfortunate one?

13,868. Yes?—There may have been such cases, but I do not remember one.

13,869. You do not think anybody remembers anything of that kind?—You have to go to Scotland for that, I expect.

13,870. That might be one reason, if there is any justification for nationalisation. I suppose you are well acquainted with the internal affairs of the owners of those estates for which you are agent, the Duchy of Lancaster, Lord Aberdare's, and the Crawshaw Bailey Estate?—Yes.

13,871. Are those people whom you mention in paragraph 2 of your *précis* persons who owned the land?—Yes, with the solitary exception of Messrs. Gwynne, Holford, Lord and Currie. By some curious freak of fate they own only the minerals and not the surface.

13,872. Do you remember who is the owner of the surface?—There are various owners. Some hundreds of years ago, I believe, a gentleman who had three daughters, and great wealth in these farms, left the farms to the different daughters, but the minerals, not knowing their value, he left in undivided thirds, and they have come down in the same way, but the surface has been sold and resold over and over again.

13,873. Who has got hold ultimately of those minerals?—These gentlemen.

13,874. Do you know how they came by them?—No, I cannot tell you.

13,875. Are you not agent for them?—I am not their solicitor. I am agent for them, certainly. I should think that question would take the solicitors all their time to answer, and it would certainly beat me.

13,876. The person who originally owned those three farms left the surface to three daughters?—Left the minerals and surface, but in the case of the minerals left it in undivided third parts. In the case of the surface he allotted such and such a number of farms to one and so on.

13,877. I think your previous answer was, not knowing there were minerals, or the value of them, he divided only the surface?—He wanted to divide equally among the three; therefore he determined that the shares they had should be divided in the rates of what their ultimate value proved to be.

13,878. Was that the surface?—The surface he could tell the value of. The minerals he could not.

13,879. Had minerals been proved?—Barely, then.

13,880. Had they been bored for?—Not immediately on that property.

13,881. Who owns the minerals at the present time—is it Gwynne, Holford, Lord and Currie?—Yes.

13,882. They hold them?—Yes.

13,883. Would it be possible to produce the title or the charter by which they hold them and from whom it was granted?—It would not be possible for me to do it, but I would endeavour to get it done.

13,884. You would ask your client to do it?—Yes.

13,885. About the Margam Estate, who is the owner of that?—The late Miss Talbot was the owner. She has left it in the hands of trustees.

13,886. She held the surface and all the minerals?—And all the minerals.

13,887. Did you ever come across her charter?—Never; I do not know quite what you mean.

13,888. Did you grant any leases on her behalf for working the coal?—I negotiated for them. The solicitors drew the leases, but I know all about them.

13,889. That is, between Miss Talbot, or the trustees for Miss Talbot, and the people who work them?—That is so.

13,890. You do not know anything about the late Miss Talbot's title or right?—I am informed that

these minerals were specifically purchased from the Crown by Sir Rice Mansel in 1540, with the sanction of Parliament.

13,891. They ultimately came down to Miss Talbot?—Yes.

13,892. Miss Talbot, you say, worked one of her collieries when it had been given up at a loss of £80,000?—Or more.

13,893. She ultimately offered it lock, stock and barrel?—Yes. The men demurred to this. The men came and appealed against this, as they call it, hardship; and no doubt it was a hard case, as the winter was coming on, and I heard frequent mutterings. They said it could be worked and should be worked at a profit, and I determined to ask Miss Talbot's permission to let them have it as nearly free as possible, and I offered it on those terms, but they did not care for it, and they instructed a solicitor to try and get up a company to go on working, but nothing came of it.

13,894. That is, you asked her to let the men have it on the lowest possible terms, and she took 2d. a ton off the royalty and offered it to them?—Yes.

13,895. Miss Talbot was a very extensive mineral holder?—Yes, a very extensive mineral holder.

13,896. Could you give us a hint as to what her income from minerals was per year?—Yes, I think I can.

13,897. That would be very interesting?—A little under £30,000.

13,898. Is that an average for a period?—No, it happens to have been last year, 1918. It shows rather a falling off or a considerable falling off from that of 1917, but it may interest you to know that it is a very newly developed estate. It has not been worked very substantially for a great number of years. It was only about the year 1890 that developments became acute, when in fact she established the new dock and works at Port Talbot at a cost of the best part of a million.

13,899. Was Miss Talbot about the wealthiest woman in Great Britain?—Such things are said. They are not reliable. She was a wealthy woman, no doubt.

13,900. Have you any idea what her wealth was?—No, none whatever.

13,901. She finally shut up this colliery or had to shut it up because she was losing?—Yes, she lost £90,000, I think it was, in about three years. The fact was the colliery had been worked to the deep and it was very difficult to get coal out profitably.

13,902. Has there been any attempt to open it up since?—No, none.

13,903. Now the Duchy of Lancaster: has that some connection with the Royal Family?—Yes.

13,904. Do you act for that estate?—Yes.

13,905. Do you know if they have any title at all to their right to work it?—I cannot say what title they have got.

13,906. Lord Aberdare is a large royalty owner, is he not?—Yes, he has about 2,500 acres of first-class quality coal, but they have been largely worked.

13,907. Is his rather a high royalty rent?—No, I should not say that. He has made substantial reductions from time to time. I do not think he is getting over 9d. now.

13,908. Does Lord Aberdare do any special work in connection with the royalty rents or does he leave it all to you and the lawyers?—Yes, I think he does considerable work on his property and in the county. He is singular in this respect, that he lives down there.

13,909. It is a blessing that he even lives there. A good many do not. Has he any particular employment?—No, except County work. He does a good deal of that.

13,910. Of course he would be a legislator up here. He would have work up here?—No doubt.

13,911. Do you happen to know how he holds his estate?—No.

13,912. Have you no idea?—I should think it is a mixed up question. A great deal of it was purchased by his grandfather, I think.

13,913. But there would be some of it acquired in some other way?—I daresay.

6 May, 1919.]

MR. ARTHUR LAWRENCE.

[Continued.]

13,914. Are you aware whether or not any of it at one time was common land?—No, I am pretty sure none of it was.

13,915. The chief thing to recommend him is that he lives down there; he is not an absentee landlord?—He certainly is not. He is a very good landlord; he is very popular down there.

13,916. I am glad to hear it. Is the Crawshay Bailey estate in the hands of the family?—Yes.

13,917. Who is the owner of it?—The late Crawshay Bailey purchased the whole of that estate with money, he earned in the iron trade.

13,918. He deserved credit?—I am glad to hear that somebody is deserving of credit.

13,919. You do not remember who he purchased it from?—I have heard the names, but I do not recollect them.

13,920. I suppose you had the title deeds when he purchased?—Those were never in my custody.

13,921. *Mr. Arthur Balfour*: There is no doubt in your mind that if royalties were nationalised proper compensation ought to be paid?—No doubt whatever.

13,922. Compensation is really an honest payment for value received?—Certainly.

13,923. If it were necessary to have that settled by an impartial tribunal, you would agree to that?—There would be no difficulty whatever about that. If any competent and impartial tribunal were instructed to make a valuation they would or should know how to proceed about it. There are accepted valuers for those matters.

13,924. *Mr. Frank Hodges*: Have you had any experience of State management?—Not except mineral estate. Do you mean as regards houses?

13,925. Or any kind of industry. "State management," I asked?—No; unless you would call being Mineral agent to the Duchy of Lancaster State management. I do not suppose you would.

13,926. That is not exactly the State. That is private property?—Certainly.

13,927. If the State managed these things, would it be possible to get quick decisions and settle the questions as you have been able to settle for private owners?—I confess I should be very doubtful about that.

13,928. *Mr. F. Hodges*: As a matter of fact there is a good deal of haggling between you and the colliery proprietors before you come to a decision as to whether you would make a concession, is there not?—No.

13,929. Have you not demanded a full examination of the colliery company's accounts before you have entertained the thought of making a concession?—In one case at all events where I contemplated advising a very substantial concession, I said that my recommendation for it would be conditional upon my having documentary evidence that they had lost the sums they spoke about, and I certainly went into it then.

13,930. That is to say, you engaged a chartered accountant to make an investigation?—I do not remember that. It is a long time ago.

13,931. But you did engage a mining engineer to go and make a survey before you came to a decision?—Which case are you speaking of?

13,932. I am speaking of the majority of the cases you speak of where the owners asked for a concession?—I look at it from the facts commercially and geologically and from every point of view.

13,933. Supposing I were the proprietor of the Bryndu Collieries, which I know?—No doubt you do.

13,934. And I came and said, "I want a concession off the royalties, or I shall have to close down tomorrow, you would not come to a conclusion at once, would you?—No.

13,935. And you would not expect the State to do it?—No.

13,936. You would ask for a very thorough examination into it?—Yes.

13,937. I am not referring to the Bryndu Colliery for its own sake, but this colliery is abandoned, is it not?—Yes, it is abandoned, but its territory is relet with a bigger scheme which will envelop it.

13,938. That is to say, the whole tract which has been abandoned is now about to be let to North's Navigation Colliery Company?—No, to Baldwins.

13,939. So that the mineral property has assumed an economic value again?—Yes.

13,940. Before Baldwins took it over it had no economic value?—That is so.

13,941. It was abandoned?—Yes, and it has no economic value now unless and until Baldwins sink a pit into the deep side to win it properly. There is no use going from the outcrop, but if they tackle it elsewhere, it would have value.

13,942. That is to say, until other people's capital is applied to the Bryndu Estate it has no economic value?—Yes, until further capital, whether of Miss Talbot's or Baldwins', is brought to bear for a pair of pits that cannot be won profitably.

13,943. That is to say, if Messrs. Baldwins had never contemplated taking it over, you would not have asked, if that property were nationalised, that that uneconomic property should be compensated for?—I do not quite follow the question.

13,944. I will put it in another way. Suppose that property is still abandoned?—And Baldwins had not come forward at all.

13,945. Yes; that Baldwins had not come forward at all, and in six months' time the State decided to nationalise the minerals. Would you come forward with a claim for compensation for the minerals in that abandoned property?—Oh yes.

13,946. Why?—Because they have potential value, which value if you will only wait patiently I think you will see developed.

13,947. By other people's capital?—That does not affect the question. The lessee or the owner of the freehold of the minerals would participate whether the capital was found by this man or that.

13,948. But surely it is the other capitalist's money which has been put in at a risk, and if there is any truth in the theory that profit is the reward of risk, it is that man who ought to have the benefit of that mineral property there, and not Miss Talbot's trustees who have abandoned it?—No; I know what you mean, but I cannot agree with you there. Supposing a certain person, say Baldwins, sunk a pair of pits and worked this at present derelict property belonging to Miss Talbot: whether they risk much or little she should be paid for her royalty. That is my view.

13,949. Is that a dead rent on the property?—No. On the neighbouring property, yes, but not on the specific property. It is cast in with four times its own area in a larger taking of about 3,500 acres.

13,950. One other question, and I will not ask you any more. I should like to understand a bit better how you can stimulate the activities of a colliery company by making a concession. You say at page 2, paragraph 20, "If no such royalties existed at all, certain inferior collieries would look in vain for any outside help."—Yes. Can you not imagine that the colliery may become more and more unprofitable through more and more lack of capital until they are cut down to the point that their manager advises them that they ought to spend £1,000 on some economy underground, and they say, "We have not got £1,000"?

13,951. How would they get it?—By going to their landlords; that is my experience.

13,952. But supposing they had nothing to pay to the landlord?—Then the colliery would stop. Your question was, "Supposing they had nothing to pay to the landlord."

13,953. Yes?—I am not suggesting they are paying nothing to the landlord, but the landlord pays something to them.

13,954. But he is not. He has simply lifted the burden a little more from the shoulders of the capitalist engaged in the enterprise?—No; he enables them by that £1,000 to weather the rock.

13,955. But the rock is just the rock which you have left still upon his shoulders. That is so. If he had no royalty at all to pay, he would have had that money at his disposal in order scientifically to have developed his concern. Do you agree?—He would no doubt

6 May, 1919.]

MR. ARTHUR LAWRENCE.

[Continued.]

have had the value of those royalties if he had not spent them in some other way.

Chairman: I will ask Mr. Evan Williams, the other local gentleman, to question the witness.

13,956. *Mr. Evan Williams:* As I gather, what you mean is, whoever owns the minerals a charge has to be made for the royalty upon them?—Yes.

13,957. That is a charge upon the industry?—Yes.

13,958. If the private owner is in the position to reduce that charge to a colliery owner in justice he thereby puts him in a relatively better position?—Yes. Really he puts him on his legs to that extent, and I have known cases where such a help has saved a colliery. I am not suggesting that every time a lessee tells you he will be obliged to stop next week that I think he is going to do it, but in some cases it is as bad as that.

13,959. With regard to undeveloped coal, have you any experience of undeveloped coal having had to pay Death Duty?—Yes, I have a good deal of that, but the valuation of undeveloped or unwon coal is an everyday matter in Wales. I have heard it suggested here to-day that no coal can be deemed to have a substantial value unless it has been seen or something of that sort. That is absolutely fallacious. Without boreholes and without drivages into the property any mining man, worthy of the name, can predict with absolute certainty that he is going to get certain seams in certain order. When seams are outcropping at the side of a valley and are worked there, and here you find them outcropping again and dipping towards each other, you have no doubt whatever as to what you will find in the middle.

13,960. It is practically a geological certainty?—Yes.

13,961. *Mr. Hodges* questioned that there was any value in these minerals of Miss Talbot's. Has a valuation been made of her estate for probate purposes?—Yes.

13,962. Was any value put by the State upon those minerals?—Certainly.

13,963. Your view is that any minerals which are considered by the State to be of value for the purposes of Death Duty certainly ought to be the subject

of compensation?—Yes, and I suggest if there is any difference between the State and the owners, it should be gone into by some tribunal which should decide it, because there should be no difficulty in getting at the right end of it.

13,964. And you would approve of a tribunal being set up to settle matters of this kind and of the kind that have been referred to?—Yes. I am not giving you any opinion as resulting from a consideration of what has taken place lately. For the last 30 or 40 years my belief has been that if a man obstructs the rest of the world he ought to be put aside and made to give way. I must say I cannot understand why the principle of the Railway Clauses Act, 1845, has not been broadened. If a man is not inclined to sell his land under that Act, he is obliged to whether he likes it or not.

13,965. And similarly to let his coal?—Absolutely. But let him have absolutely reasonable terms. He should not be allowed by asking excessive terms to block an industry.

13,966. Some questions were asked by Mr. Smillie about payment for small coal, and it was said the collier was not paid?—Indirectly he is paid.

13,967. Are you aware of the general arrangement in South Wales and the clause in the general agreement that all services performed in the getting of the small coal are paid for in the price of the large?—That is it.

13,968. You made some reference to short working. Is it your view that short working should be recoverable over the length of the lease?—Yes, but there again the circumstances should be taken into consideration. If a man has incurred short workings and has nevertheless endeavoured to drive forward and make them merge in royalties, he should be allowed further time for it; but if, on the other hand, loss, I do not see that he is entitled to any consideration.

Chairman: We have had a general cross-examination by two local Commissioners, Mr. Evan Williams and Mr. Frank Hodges, who come from South Wales, and now I suggest that you should let me call Mr. Downing.

(The Witness withdrew.)

Mr. STANFORD EDWIN DOWNING, Sworn and Examined.

13,969. *Chairman:* I believe you are the Secretary of the Ecclesiastical Commissioners for England?—Yes.

13,970. You say in your proof:—

“1. Witness is Secretary of the Ecclesiastical Commissioners for England.

2. Ecclesiastical Commissioners are owners of coal and other minerals under large areas in several parts of England and Wales—especially in Durham and Northumberland.

The coal is partly in course of being worked, partly awaiting development.

As an indication of the extent of their interest as owners in this class of property, the royalties and wayleave rents in respect of coal workings in 1917 amounted to about £370,000.

3. Ecclesiastical Commissioners do not themselves work minerals; the right to work is demised by them to lessees.

4. Ecclesiastical Commissioners hold their property for the statutory purpose of (speaking generally) augmenting poor benefices. The parochial clergy are in effect the beneficiaries for whom they hold their property.

5. In addition to property vested in themselves, Ecclesiastical Commissioners are concerned with all the properties of incumbents of benefices. Leases or sales of minerals under lands belonging to benefices are made only with the approval of the Commissioners. The royalties are paid to the Commissioners to be invested for the particular benefices. Arrangements for letting practically fall into the hands of the Commissioners.

6. Coal under about 200 glebes is let. The number of separate leases is greater than this.

Royalties received for particular benefices in 1917 amounted to £40,000.

Wayleave rents belong to the individual incumbents.

7. The interests of the Commissioners in the coal industry, whether in respect of properties vested in them for a statutory purpose or coming under their control as trustees for Ecclesiastical Corporations, are those of owners of mineral rights.

I.—AS TO NATIONALISATION BEING NECESSARY OR UNNECESSARY.

8. By mineral rights witness understands rights—whether flowing from full ownership or any less interest in land or a severed portion of the land (*viz.*, the minerals within or underlying it)—to work or allow others to work the mines and minerals, and to perform any operation in connection with the working, *e.g.*, operations for ventilating and draining mines, for carrying the minerals from place to place underground or overground, etc.

Rights over the surface are also presumably included in the expression mineral rights, *e.g.*, the right to use the surface for sinking a pit, erecting colliery machinery and plant of all sorts, and perhaps for the erection of cottages for workmen.

9. These rights are rights of private property, and the nature of the interest of an owner of mineral rights is very much affected by the question whether he is also the owner of the surface and, if he is not, by the conditions upon which the surface and the minerals have been severed.

6 May, 1919.]

MR. STANFORD EDWIN DOWNING

[Continued.]

10. There is great variety in these conditions arising out of the various ways in which the severance has been effected, e.g.—

- (a) by private contract (on sale of land with a reservation of the minerals);
- (b) by statutory contract on sale of surface under—
Land Tax Redemption Acts,
Railway Clauses Acts; or
- (c) by Enclosure Acts (special and general).

There are also the special conditions (affected by custom) limiting the Lord of the Manor's ownership of minerals underlying copyhold tenements and wastes of the Manor.

But if by "mineral rights" we understand all the rights over minerals and surface which it is necessary for the persons working the minerals to exercise with a view to efficient working, these varying conditions do not affect the question "What are mineral rights?" but the question "Who possesses these rights?"

The simplest case is that of the owner of surface and minerals in fee simple in possession free from incumbrances. He possesses all the rights. In other cases the rights may be divided in a great variety of ways among several persons.

11. By nationalisation of mineral rights the witness understands to be meant the acquisition by the State of the rights of private ownership above indicated.

The object of such acquisition is presumably to promote the efficient and economic working of collieries throughout the country, this being accepted as being in the national interest.

12. Mining development is only in exceptional cases the work of the owner of the mineral rights as such. The "undertakers" are the companies or individuals who sink the pits and work the coal. There is sometimes between these and the owner of mineral rights a "Pioneer Company" who prove the coal and get into their hands the mineral rights over a sufficient area, and so facilitate the actual work of the mine workers.

The interest of a mineral owner as such (and as distinct from any interest as surface owner, if he also owns the surface) is to secure that the minerals shall be worked. The private owner has a pecuniary interest in encouraging exploration work and vigorous working; that interest is an incentive to development; how efficient it may be must depend upon the character of the estate and the owner; such general tendency as there is must be in the direction of favouring development; the mineral owner is a person who has an interest in getting the capitalist to come forward and develop the mineral resources.

It is not clear that this incentive would be more powerful in the case of State ownership.

Mineral owners are able to, and do, by timely concessions encourage their lessees in the prosecution of their work in times of difficulty.

13. It is said, however, that private ownership has certain effects in the other direction (of retarding or hindering economic and efficient working), and as examples of this are the following (I suppose admitted) difficulties:—

- (a) That while development depends upon agreements being arranged between numerous owners on the one hand and mine workers on the other, a general plan for the systematic development of the coal resources of the country is impossible.

But this is more an objection to private enterprise in working than to private ownership of the minerals. If a national or local plan of systematic development in working be arranged, the mineral owner would have no choice but to adapt himself to it.

(b) That in existing circumstances the mine worker is hindered in his operations, or economic development is frustrated by private ownership owing to—

- (i) mere unreasonableness on the part of a private owner, refusing to grant facilities or to grant them on fair terms (holding up, locking up, wayleaves, etc.);
- (ii) difficulties of getting together in agreement the representatives of various interests in the ownership—either number of separate estates or number of interests in estates or limitations of powers of private owners (e.g., infants, lunatics, persons having doubtful title or restricted by covenants with others, etc.);
- (iii) the requirement of boundary barriers (as distinct from barriers against gas, water, etc.).

These difficulties are frequently exaggerated, but they undoubtedly exist. As nationalisation would substitute one owner for many, it would clearly be a means of disposing of them. It is not, however, the only means.

(c) The mine worker complains sometimes of the inflexibility of the private owner in adhering to terms which under altered conditions have become unreasonable.

Nationalisation would not necessarily provide a remedy for this complaint.

(d) Great difficulties are experienced in efficient working of the mines owing to the rights of surface owners to support in varying degrees. There is no generally applicable code of rights as between mineral owner or mine worker and surface owner.

No one code generally applicable could be devised to meet all the varying circumstances.

This difficulty would not be overcome by nationalisation of the mineral rights.

It is not merely a question of relative rights of owners, but of the best uses in the national interest to which the whole property (minerals and surface) can be put.

14. If private ownership is not essentially antagonistic to economic development, but nevertheless creates certain difficulties, can these be met other-wise than by nationalisation?

It is suggested that all these difficulties would be met by the establishment of a system of compulsory submission to a suitable tribunal armed with adequate authority to make orders appropriate to the particular case.

This implies a restraint on the powers denoted by absolute ownership. The restraint would be justified on the ground that the national interest required it. It is only an extension of the principle embodied in the Statutes relating to the compulsory acquisition of land for public undertakings.

At present an undertaking obtains statutory powers for the application to its case of the compulsory powers of the Lands Clauses Act. What happens mostly is that difficulties are settled by agreement; but where this is not possible, the assessment of compensation goes to a tribunal established under those Acts.

To apply this to the case of the collieries, what is necessary is to set up an authority which may decide whether the case is one for the application of compulsory powers, and, when that is decided, to remit the assessment of compensation to a tribunal of valuation.

Then, whether it were for the purpose of laying out a new colliery or to facilitate working an existing colliery, on the need arising for the acquisition of any right, there would be the means of the colliery acquiring it.

6 May, 1919.]

MR. STANFORD EDWIN DOWNING.

[Continued.]

15. Difficulties very similar to those affecting the development of colliery enterprises arise out of private ownership in matters concerning the development of the surface, e.g.—

Agricultural drainage.
Town planning.

They have been overcome in the national interest without nationalisation of the surface by Drainage Commissions, town planning schemes under the authority of appropriate local bodies, etc.

II.—METHOD OF COMPENSATION IF NATIONALISATION DECIDED UPON.

16. If the minerals and mineral rights are acquired by the State in the national interest, individual owners should be compensated according to the values of their respective properties.

The interests of mineral owners vary from the absolute ownership of the surface and minerals of an area forming the whole of a colliery undertaking to such an interest as a copy-holder possesses in a few acres comprised in a colliery undertaking.

The mineral owner's interest may be at the moment producing a revenue or only having a capacity to produce a revenue.

Compensation can be assessed only by valuation of each separate portion of minerals in any colliery undertaking or area of development with regard to the surface rights going with it.

17. There are two broad divisions—

- (a) Coal that is actually being worked or is comprised in a mineral letting or colliery undertaking.
- (b) Coal not at present being worked and not comprised in a mineral letting or colliery undertaking.

The second division (b) may be further subdivided into—

- (i) proved seams of coal which may either be underlying areas in which other seams are already in working or may be under other areas not at present being worked for any seam;
- (ii) unproved areas where the information concerning the coal may vary from practical certainty to mere suspicion of its existence.

18. In the course of transactions relating to land and minerals, properties of all these classes have to be valued from time to time, and, nationalisation being regarded as a purchase by the State, it would not be beyond the powers of expert valuers to arrive at the fair price on the basis that the parties had entered into a treaty for sale and purchase.

19. It would be a question for consideration whether the State would proceed to acquire at once all coal, whether in the course of being worked, or proved but not now worked, or unproved.

20. In my opinion more than the coal actually worked or comprised in a mining lease would have to be acquired and the owners compensated at the same time.

Much coal not actually being worked nor actually demised obviously falls within the sphere of some existing colliery undertaking almost as much as some coal actually demised.

The State would need power to acquire coal before it should be actually worked or leased, and it would be difficult to define any stage of development before which the powers of State acquisition should not be exercisable.

21. Whether, therefore, the compensation for all mineral rights had to be settled at the present time or not, there would be problems of valuation in relation to practically all the classes of properties in the above-mentioned divisions (paragraph 17).

22. In the case of coal now being worked the elements affecting valuations which are known are—

- (a) the minimum rent and the royalty, per ton or other unit of measurement, receivable by the owner;

(b) the actual annual rent now being paid to the owner (not less than but often considerably more than the minimum rent);

and there can be estimated—

(c) the amount in tons or other units comprised in the area of valuation;

(d) the number of years within which the coal will be worked or paid for by the minimum rent or by royalties at the ascertained or reasonably expected rate of working;

(e) whether the life of the mine is within the time of the existing lease or may be beyond it; if the latter, it might be necessary to consider whether the coal would all be worked out at existing rates of royalty or whether there might not be a variation on the renewal of the lease.

23. From these data can be computed—

- (a) the annuity which the working of the coal produces or should produce to the owner;
- (b) the probable duration of the annuity.

The present value of this temporary annuity is the value of the mineral owner's interest in the coal. The element in the computation which has to be settled is the rate of discount.

The main circumstance affecting the question of the rate to be adopted is the security of the annuity. A well-secured annuity at the present day might be discounted at, say, 5 per cent. The annuity from royalties on a mineral letting is subject to certain contingencies, but it is a first charge on the produce of the mines. If liable to fluctuation downwards, it may equally vary in the other direction with more vigorous working.

Possibly, having regard to these considerations, a 6 per cent. rate would be fair for adoption.

Discounting at 6 per cent. any length of time beyond about 60 years would not affect the calculation.

24. In regard to minerals proved but not in working, the same data would probably be ascertainable, though largely dependent upon expert opinion, and the same calculations could be made. But in addition, an estimate would have to be formed of the time from which the estimated annual rent would commence, and the ascertained value would be discounted for that number of years.

25. In regard to minerals unproved, the object would be to arrive with expert assistance at something which could be described as the market value. It is obvious that the same calculations cannot be gone through, or, if they are, they must be based on assumed data. But the valuation must be possible, for the Finance Act of 1909-10 contemplates it being made as to every parcel of minerals in separate ownership.

26. Valuations of unproved coal, though they may have to be made, can rarely be satisfactory. They must depend upon expert opinion which there is little or no means of testing, as there are few transactions in such property.

In such circumstances the "market value" may well be very inadequate compensation to an owner who can afford to wait for the development of the minerals.

Such an owner would prefer to have the assessment of compensation postponed until the minerals should be ripe for development."

I am very much obliged to you for that careful proof.

13,971. Mr. Robert Smullie: Are the Ecclesiastical Commissioners, as a corporate body, connected with any organisation for the protection of mineral royalty owners?—No, none.

13,972. Did you draft this *précis* yourself?—I wrote it myself.

13,973. I suppose you have considerable knowledge of your methods and the terms of the leases which you gave to those who are working the minerals belonging to the Ecclesiastical Commissioners?—Yes, a fair knowledge.

6 May, 1919.]

MR. STANFORD EDWIN DOWNING.

[Continued.]

13,974. Could you tell us how the ground found its way into the hands of the Ecclesiastical Commissioners?—Do you mean the minerals?

13,975. The portion of the earth which you claim. How did it find its way into their hands?—For the most part, it formerly belonged to bishops, or deans and chapters, who had held it for many centuries. Then it was transferred by or under an Act of Parliament of about the year 1840 to the Ecclesiastical Commissioners.

13,976. Would it be right to say that most of the ground which is presently held by the Ecclesiastical Commissioners was at one time part of the land held by the old monasteries?—No, not the old monasteries; that would not be right, because the great bulk of the monastic property went to the Crown. On the dissolution of the monasteries the monastic property went to the Crown—it did not go to the bishops, or the deans and chapters, in the main.

13,977. Could you tell us who gave it to the deans and chapters, and bishops?—Of course, their titles are very various, but I suppose that the bulk of the grants made to the bishops in the very early days, and to the deans and chapters in the early days, were grants either by the Crown, or by great subjects of the Crown.

13,978. Such as lords of the manor?—A great deal of the property that went to the bishops and deans and chapters, and now to the Ecclesiastical Commissioners, consists of lordships of manors.

13,979. *Chairman*: What is the date of the Commission. Is it 1831?—1836, I think.

13,980. Is the Commission before the Act in print still? I think you will find it is 1831?—Yes, I beg your pardon. 1832 was the first one. It was 1832 to 1835.

13,981. If you have one, will you let me have it?—Yes.

Mr. Robert Smillie: Is that the date of the birth of the Ecclesiastical Commissioners.

Chairman: No. That is the date of the enquiry which led up to the Act under which the Ecclesiastical Commissioners were constituted.

13,982. *Mr. Robert Smillie*: It is not very far to go back to the early fifteenth or fourteenth centuries. At that time I suppose that the bishops and deans and chapters as such would be in existence?—Yes, certainly.

13,983. Would they be in existence before the Reformation?—Yes, certainly.

13,984. The deans and chapters and bishops?—Yes. The bishops and deans and chapters were in existence before the Reformation.

13,985. But the property of bishops, and deans and chapters, and monasteries at that time was generally confiscated, was it not?—No, it was not. The monastic properties were.

13,986. Do you mean to say that the Church of England, for instance, and the Ecclesiastical Commissioners to-day held the property that was previously possessed by the bishops and deans of the Catholic Church?—Certainly, the bishops and deans of the English Church.

13,987. Was it handed down by the bishops and deans of the Catholic Church to the bishops and deans of the English Church?—Bishops and deans of the English Church were one both before and after the Reformation.

13,988. Still the same?—Yes.

13,989. Still unreformed?—Reformation does not create a new person.

13,990. Do you say there has been no Reformation so far as the Church of England is concerned?—I do not say that at all. I do not think it is implied.

13,991. There is a difference between the monastic possessions of the monasteries and the land which is now possessed by the Ecclesiastical Commissioners?

Yes. The monastic possessions have mostly gone into the hands of the Crown.

13,992. They were chiefly taken and annexed by the Crown?—Yes.

13,993. And largely have been distributed by the Crown to other people since?—Certainly.

13,994. I suppose you would have to search a very long way back in order to get production of the title to the land?—It depends upon what title you wanted. If you want a title to satisfy a Court of law, it is not difficult to give, but it does not always consist of a short document.

13,995. I understand the law of England is that no person can be an owner of land: he may be a holder, but cannot be an owner of land. Do you know whether that is true or not?—That is a question, I am afraid, of high legal theory, which is rather too big for me, but I do not object to it. It entirely depends upon how one understands the phrase.

13,996. I suppose, as representing the Ecclesiastical Commissioners, you would be a law-abiding person?—I hope so.

13,997. If it is the law that no person or corporation or collection of persons can own land, I suppose you would say then that it ought to be given up to those who can own it?—No; I do not see that it follows at all.

13,998. Do the Ecclesiastical Commissioners claim to own the land or only the use of it for the time being?—As regards this land we are now talking about, we claim the fullest ownership that a subject can have.

13,999. You will have the right to work the minerals in many different districts of England?—Yes, but our main interests are Northumberland and Durham.

14,000. In the north?—Yes. They are very much the largest share of our interests.

14,001. There will be mining interests where you do not own mineral rights?—Yes, certainly.

14,002. There will be mining districts where you do not hold mineral rights?—Certainly.

14,003. When you speak of the glebe that will be the portion, I think, which is really for the time being belonging to the Minister?—That is the property of the Vicar or Rector of a parish.

14,004. So long as he holds the position?—Yes; the Vicar or Rector is a corporation, and he holds it in perpetuity. The individual enjoys it for the time he is there, of course.

14,005. That is to say, he or the corporation hold also for the time being the mineral rights?—In many cases they have mineral rights, certainly.

14,006. Of the glebe lands only?—Yes, it would be in the case of an incumbent. All he would have would be the minerals under his glebe except only in cases like this—an incumbent might have sold the surface with proper consent and retained the minerals. In that case he has the minerals without having the surface.

14,007. Do your leases vary to any considerable extent as from colliery to colliery or district to district? I do not think there are very material differences.

14,008. Not as to the general terms?—I mean as to the general terms.

14,009. Does your royalty rent vary from district to district?—Yes, certainly, that would vary.

14,010. Does your method of royalty rent vary from district to district?—Yes.

14,011. Tell us the lowest and the highest so far as your memory can do so; I mean the lowest royalty rent per ton charged and the highest royalty rent per ton charged?—I do not know that I can tell you the lowest. We have some certainly at 3d. per ton. The average of our royalties works out at about 6d. Then the difficulty is a little complicated by the way royalties are calculated. They are not always calculated by the ton. Sometimes, as you know, they are calculated per foot or per acre. That makes it difficult to calculate sometimes. On an average our royalties come out at 6d.

7 May, 1919.]

MR. STANFORD EDWIN DOWNING.

[Continued.]

SECOND STAGE—EIGHTH DAY.

WEDNESDAY, 7TH MAY, 1919.

PRESENT :

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. R. W. COOPER.

SIR ARTHUR DUCKHAM.

MR. FRANK HODGES.

SIR LEO CHIOZZA MONEY.

SIR ADAM NIMMO.

MR. ROBERT SMILLIE.

SIR ALLAN M. SMITH.

MR. HERBERT SMITH.

MR. R. H. TAWNEY.

MR. SIDNEY WEBB.

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE (*Assessor*).MR. ARNOLD D. McNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

MR. STANFORD EDWARD DOWNING, Recalled.

14,012. *Mr. Robert Smillie*: On the first page of your *précis*, you deal under paragraph 10 with “(a) by private contract (on sale of land with a reservation of the minerals); (b) by statutory contract on sale of surface under Land Tax Redemption Acts, Railway Clauses Acts; or (c) by Enclosure Acts (special and general).” Would you tell us what Enclosure Acts mean?—A considerable amount of the mineral rights of the Ecclesiastical Commissioners are mineral rights under tracts of commons and what were formerly commons or waste lands of manors belonging to the Ecclesiastical Commissioners. These tracts of waste land have been enclosed by a very large number of Enclosure Acts, chiefly in the 18th century, and some subsequently. The ownership of the surface has been allotted out, by agreement very largely, to particular owners, but the mineral rights under the Act are reserved to the lord of the manor, and the lord of the manor is now the Ecclesiastical Commissioners.

14,013. You say “common lands or waste lands.” What do you mean by waste lands? Is that land which is usually useless for any purpose?—It is lands which at the time were uncultivated and not used for any purpose whatever.

14,014. I may be wrong, because I am very ignorant of these things, but I understand that common land meant land to which the people had a common right of grazing and so on. Should I be wrong in saying that?—It means lands, as I understand it, belonging to the lord of the manor, but the lord of the manor is subject to the rights of a large number of tenants of the manor on the surface for grazing and such like purposes.

14,015. The lord of the manor, you say deliberately, was really the owner of the common land?—I do say that deliberately.

14,016. Is it a fact that in some cases the lords of the manor fenced in what were called common lands, and then legalised that afterwards by Act of Parliament? Do the Enclosure Acts mean Acts of Parliament that were passed to legalise enclosures of land?—No, not quite that.

14,017. Historically is not that the case?—I think not. At the date of the Enclosure Acts the land was still unenclosed, both legally and physically, and the Act provided for its enclosure, or the enclosure of parts of it.

14,018. Were the Acts in the first place introduced into and passed through the House of Lords, and did they pass from there to the House of Commons?—That I cannot say. These are Acts of the 18th century, and I really do not know.

14,019. I wonder really what the meaning of an enclosure is?—I think it means what it says: that the Act gives specific persons the right to put a fence round a piece of land which they had not any right to do before.

14,020. You do not admit, I suppose, that the fencing preceded the Act in any case?—In no case that I know of. I would not say that there may not have been illegal enclosures, but I have no knowledge of any.

14,021. You say there is no case you know of. Do you mean, know of really from your own experience with the Ecclesiastical Commissioners, or have you read of land being fenced first and the fencing legalised afterwards? Have you read of such a thing in the history of the land system of England?—I think such cases may have occurred.

14,022. Those would come under the Enclosure Acts, would they not?—Yes; they may subsequently come under an Enclosure Act.

14,023. Do you know of any case of which you have read which has really occurred?—No; I cannot quote a case.

14,024. *Mr. R. W. Cooper*: On the question of Enclosure Acts, have you a print amongst your papers of any of your Durham enclosure Acts?—Yes. I have brought the Lanchester Enclosure Act, which is the one I am most familiar with.

14,025. Now I think Lanchester Common was a very large area of waste land belonging to the Bishop of Durham as the lord of the manor?—Yes.

7 May, 1919.]

MR. STANFORD EDWIN DOWNING.

[Continued.]

14,026. And this Act of Parliament contains the whole scheme of the enclosure?—Yes.

14,027. The preamble of the Act contains recitals setting forth the history of the ownership both of the soil and of the minerals?—Yes.

14,028. It recites that there are "within and Parcel of the Parish and Manor of Lancheester in the County Palatine of Durham divers large Moors, Commons or Tracts of Waste Land, which in various parts thereof are called by several distinct Names . . . containing together by Estimation Twenty Thousand Acres." It then recites that the Bishop of Durham "in right of his Church and See of Durham is Lord of the Manor of Lancheester," and as such was "entitled to the soil and royalties within and under the said Moors, Commons or Tracts of Waste Land," and he was also entitled to the reversion and inheritance expectant on certain leases of lands in the parish?—Yes.

14,029. Then it goes on to recite that various owners of land, whose names are set forth, and other persons "Owners of Freehold and Copyhold or Customary and Leasehold Messuages, Lands, Tenements or Hereditaments, within the Parish and Manor of Lancheester aforesaid, and elsewhere, or their respective Trustees, Lessees, or Tenants in respect of, or as appendant, appurtenant, or belonging to their" several properties are entitled to have a right of common upon these moors, commons or tracts of waste land. It then recites that these "Moors, Commons or Tracts of Waste Land in their present state are of little use or service, but considerable parts thereof are capable of cultivation and improvement, and it would be of advantage to the said Lord Bishop of Durham, and the several persons entitled to such right of Common as aforesaid, to have the said Moors, Commons or Tracts of Waste Land divided and enclosed, and specific shares thereof allotted to them according to their several rights and interests therein." That could not be done unless an Act of Parliament was passed?—That is so.

14,030. Then, first of all, Commissioners were appointed to carry out the Act, and then these Commissioners were directed to ride the boundaries of the common, and public notice had to be given of this public boundary riding. Then does it go on to provide that persons having claims in respect of the common have to send in their claims?—Yes.

14,031. Then section 5 provides that after the boundaries have been ridden a map or survey has to be prepared?—Yes.

14,032. Then the Act provides for the division of this waste land by these Commissioners, or by arbitrators, after hearing all the claims amongst the persons entitled to rights of common?—Yes.

14,033. And finally, so far as our present purpose of to-day is concerned, it provided for the complete reservation to the Bishop of Durham and his successors of all the mines and minerals under these tracts of waste land?—Yes.

14,034. The Act of Parliament, of course, speaks for itself?—Yes.

14,035. I think your predecessor was the late Sir Alfred de Bock Porter?—Yes.

14,036. No doubt you have read the proceedings of the Mining Royalties Commission which sat in 1893?—I have done so, no doubt, at some time.

14,037. I think Sir Alfred Porter gave evidence?—Yes.

14,038. Was he the first witness called before the Commission?—Yes.

14,039. Did he explain fully to the Commission the practice of the Ecclesiastical Commissioners with regard to the granting of their leases, and did he give the Commission full information with regard to their rents and wayleaves?—Yes.

14,040. Speaking of the County of Durham—and in that I include Northumberland—can you tell me what is about your average rent per ton of coal let by the Commissioners?—The average is 6d.

14,041. I do not know whether you were in the room yesterday when Mr. Arthur Lawrence was giving

evidence, and when he gave instances of the late Miss Talbot having gone out of her way to assist colliery lessees in times of difficulty?—I heard part of that.

14,042. Is it not the fact that the Ecclesiastical Commissioners have done the same thing in the County of Durham?—Yes, from time to time.

14,043. I believe it is the fact that not only have they reduced the rent when they thought a case was made out for reduction of rent, but they have also from time to time assisted their lessees financially?—Yes, by loans.

14,044. Have they been spread over a long term of years in the shape of an annual sinking fund payment?—That has been the general method.

14,045. Equally, when difficulties have arisen with regard to the surface, to which you refer in your *précis*, owing to the surface having rights of support at law, and the colliery worker not being at liberty to take out the coal owing to the existence of the right of support, have not the Commissioners frequently assisted their lessees to buy up the surface?—Yes, and sometimes they have bought the surface themselves.

14,046. So that there has been, so far, a complete community of working in the North between the Commissioners and the colliery workers?—I should say distinctly so.

14,047. You say in your *précis* that the Commissioners, being such large owners of property, have practically experienced all the legal difficulties that can arise from the present constitution of the rights of property?—I should say that is so.

14,048. That is to say, they are owners sometimes both of the surface and the coal?—Yes.

14,049. And they are owners of the coal where there is a right of support to the surface?—Yes.

14,050. And sometimes they are the owners of the coal, where there may not be a right of support to the surface, depending upon the conditions upon which the surface may have been disposed of in years gone by?—Yes. We are not subject to the difficulties that sometimes occur with private owners from the fact that there may be persons not *sui juris*, or who are incapable for some other reason. The Commissioners, under an Act of Parliament, have the right to exercise over all their property, including minerals, the power of absolute ownership.

14,051. Do you grant leases, if so desired, for as long as 63 years?—Yes, and longer.

14,052. And you do not wait for the complete expiration of an existing lease before you renew the lease?—No; we should think that unreasonable.

14,053. In fact, as you know, you have renewed leases a good many years before the termination of the existing lease?—Certainly.

14,054. Has that been on lessees representing to you that they desire to embark on an expenditure of capital, and that they wish to have a long tenure as security for their money?—That is the general reason.

14,055. As regards the conditions of the lessees themselves. I think you give the utmost protection to a lessee if his venture proves to be a failure by letting him have an easy power of surrendering his lease?—Yes. Those powers of surrender differ a little in different districts. In Durham and Northumberland the ordinary power of surrender is that a lessee can give it up at any time by 12 months' notice.

14,056. That is to say, at the end of any year of his lease on 12 months' notice?—Yes, without even the allegation that he cannot work it any more or anything of that kind. In other districts it is more usual to provide for powers of surrender on the Colliery Company showing that the coal can no longer be worked at a profit, and that provision is a provision which rests not on the mere judgment of the lessor, but is subject to arbitration, of course.

14,057. In Durham and Northumberland, where your mineral interests are, the lessee practically has an unconditional option of giving up his lease?—That is so; if I may say so, we have been able to trust our lessees.

7 May, 1919.]

MR. STANFORD EDWIN DOWNING.

[Continued.]

14,058. I know a good few of your lessees, and I know they have every confidence in you. In renewing these leases—for example, a lease which may have 15 or 20 years to run—although they may have fully established collieries on the mining area, and the mining buildings legally revert to the Commissioners at the end of the lease, you do not ask for any rent on account of that right of reverter?—Absolutely none.

14,059. You simply renew the lease as the property stands, having regard only to the rent per ton of coal worked as coal only?—Yes; it is a question of what is the proper royalty per ton to be obtained there.

14,060. Upon that point of course you have a detailed report from your mineral agent in Durham or Northumberland, who confers with the lessee and obtains full information as regards the actual state, so far as it can be known, of the coal remaining unworked?—Yes, certainly.

14,061. *Mr. Robert Smillie*: May I clear up one point which may be misleading? You speak of the "mine workers" here. I think your understanding of the term is different to ours. By "mine workers" I think you mean the colliery proprietors who work the seam?—I do where I use that expression in the *précis*.

Mr. R. W. Cooper: I used it in the same sense. I did not mean what I call the workmen who are employed, but the undertakers, whether public or private, carrying on the work of the mine.

Mr. Robert Smillie: Yes, but if it goes out that the best of good feeling, harmony, and brotherly love exist between the landlords and the mine workers it will be very misleading.

Mr. R. W. Cooper: So far as I know there is no contact between the two.

14,062. *Sir Leo Chiozza Money*: With regard to paragraph 26 of your *précis* you say, "valuations of unproved coal, though they may have to be made, can rarely be satisfactory." Can you tell me from your own knowledge or experience what has been done in connection with such valuations for the purpose of death duties?—No; I do not know anything about death duties, but I have had some experience of them in connection with other purposes of the Finance Act.

(The Witness withdrew.)

The Chairman: I am now going to call two witnesses from the Inland Revenue to speak as to the

14,063. I mean with regard to royalties?—I mean royalties. The unproved areas, of course, may have to be valued and a provisional valuation made under the Finance Act, exactly as in the case of the surface.

14,064. But you know nothing as to unproved coal?—Oh yes. Areas are valued under the Finance Act, and I have had some experience of what has been done.

14,065. Could you tell us very briefly what has been done? Taking a concrete case, what valuation is put upon unworked coal?

Chairman: I am going to call two Inland Revenue witnesses who will speak as to the method of valuation.

Sir Leo Chiozza Money: Then I do not ask this witness any further question.

14,066. *Mr. Arthur Balfour*: May I ask one further question? If royalties were taken by the State and not compensated for, it would be a very great hardship on a great number of persons, would it not?—It certainly would be in the case of the royalties of the Ecclesiastical Commissioners.

14,067. Many of whom are living on a very small amount of money in comparison with what they have to do?—Yes. The revenues of the Commissioners are applied wholly to providing incomes for clergy—subject to the charges, of course, on the revenues—and the incomes of the clergy that the Commissioners are able to augment, or further provide for, at the present time rarely exceed £300 a year, and many are very much less.

14,068. And some are as low as £150?—Yes.

14,069. *Mr. Herbert Smith*: If the royalties were taken away and given to the 178,000 who are injured in the mines each year it would be a God-send to them, would it not? If it were used in compensation it would be all the better?—Anything which they can get by any process whatever would be no doubt a benefit to them.

The Chairman (to the witness): I am very much obliged for the two books which you have sent me. One is the Report of the Ecclesiastical Commissioners, and if you will allow me I will keep that a few days in order to read it and let you have it back. The other is the "Sketch of the History of the Ecclesiastical Commissioners," written by Sir Lewis Dibdin and yourself. May I be allowed to keep that?

The Witness: If you please.

method employed at the Inland Revenue with regard to valuation for probate purposes.

MR. THOMAS ALOYSIUS O'DONAHUE, Sworn and Examined.

14,070. *The Chairman*: I believe you are a mining engineer of 28 years' experience and for the past 9 years you have been engaged as a Mineral Valuer in the Valuation Office of the Inland Revenue Department?—Yes.

14,071. Are you a Fellow of the Geological Society, a Fellow of the Surveyors' Institution, a Member of the Institution of Mining Engineers, and do you hold a first-class certificate of competency as a colliery manager?—Yes.

14,072. Are you the author of "The Valuation of Mineral Properties" and other technical works?—Yes.

The Chairman: I will ask the Secretary to read your proof.

The Secretary:

"I understand that it is desired that I should explain to what extent the Valuation Office deals with mineral properties and the procedure adopted. It is necessary to explain at the outset that I have no authority to submit an official view, and my remarks must be taken as an expression of personal opinion.

The Finance (1909-1910) Act, 1910, levied two new duties on minerals—(1) Mineral Rights Duty and (2) Increment Value Duty.

Mineral Rights Duty.—This is a duty at the rate of 1s. in the £ charged on mineral royalties and wayleaves. The duty is charged on the rents received in respect of all minerals with a few minor exceptions, such as sand, gravel, limestone, &c. As it is presumed that the Commission is not concerned with the minerals which are not subject to Mineral Rights Duty, it is proposed to ignore the procedure in respect of these.

The Mineral Rights Duty is charged on the rents received in each year where the minerals are let or leased for working, and where a proprietor works his own freehold minerals, the Mineral Rights Duty is charged on the quantity of minerals worked, at a rate based on the customary royalty rent of the district.

Increment Value Duty.—This duty is chargeable on minerals which were not in working or in lease at the 30th April, 1909; and not on minerals which were in lease or in working at the 30th April, 1909, so long as they are not out of lease or not out of working for a period of two years.

The duty is chargeable in two ways, one method being applied where the minerals are not in lease or

7 May, 1919.]

MR. THOMAS ALOYSIUS O'DONAHUE.

[Continued.]

in working, and the other where the minerals are in lease or in working.

Where minerals which are not in lease or in working pass on sale or death, Increment Value Duty is chargeable where increment is revealed between the original capital value fixed as for 30th April, 1909, and the capital value on the occasion under consideration. The Increment Value Duty payable is 20 per cent. of the increment revealed in excess of 10 per cent. of the original capital value.

Minerals which are in lease or in working, and which were not in lease or in working at the 30th April, 1909, are not liable to Increment Value Duty of the capital variety when transferred, but are liable to an Annual Increment Value Duty based on the rents paid or the quantity worked in each year. The Annual Increment Duty is 20 per cent. of the excess over 8 per cent. of the capital value of the minerals.

It may be pointed out that Mineral Rights Duty merges into Annual Increment Value Duty; the effect is that only one of the two duties is levied in any case.

Original Valuations.—To measure the increment value duty payable, valuations have been made of minerals not in lease in practically all the cases where the owners have made returns in respect of the minerals, and in all cases where the minerals have passed on death. The valuations made probably deal with the more valuable portion of the minerals which are not in lease.

The method adopted in making such valuations is the ordinary one adopted by a mining engineer. Where there are more or less definite data of the number of coal seams present and the probable thickness of coal available, the engineer estimates the gross royalty value of the minerals, he then estimates the annual revenue which the property may be expected to yield and the number of years during which this revenue may be expected to be realised. From his knowledge of the circumstances he must form an estimate of the period which is likely to elapse before revenue will begin, and with these factors he calculates the present value on the basis of a deferred annuity, adopting such a rate of interest as he deems applicable to the particular case after due regard to the risk to which the revenue is subject. The rates of interest adopted in practice in normal times usually range between 8 per cent. and 15 per cent.

Generally in large mineral estates the prospective annual revenue varies between £1 per acre and £5 per acre according to the number, thickness and quality of the workable seams. If it were estimated that the revenue would begin immediately, and a 10 per cent. rate of interest were bargained for, then, with rents of from £1 per acre to £5 per acre, we would get capital values of from £10 to £50 per acre. If there were no prospects of the minerals being won immediately, then the figures would require discounting for the deferred period, and with high rates of interest, a few years of deferment have a great effect on capital value, the value being divided by two for every 6 to 10 years' deferment.

Estate Duty Valuations.—From what has been stated it will be understood that minerals in lease are not valued for Increment Value Duty purposes, but such estates are valued when they pass on death and under a voluntary conveyance. The procedure is similar to that adopted in making the valuation of an unleased area, except that more precise data are available. The prospective revenue from the estate is capitalised for the life at a suitable rate of interest. The rates of interest customarily adopted with pre-war conditions were from 6 per cent. to 12 per cent.

Collieries in private ownership which pass on death are also dealt with by the Valuation Office. To form an opinion upon the value of a colliery the engineer usually makes an estimate of (a) the quantity of coal available, (b) the annual output, (c) the life, (d) the annual profits, (e) the breaking-up value of the plant at the end of the term and (f) the cost

of fulfilling all obligations at the end of the lease term. If the colliery is known to have a "full" life, say 40 years or more, it is unnecessary to go precisely into all the various points enumerated above, an estimate of the annual profits is then the only serious consideration, as over 40 years is for practical purposes equivalent to a perpetuity at the high rates of interest adopted in making colliery valuations.

It is somewhat difficult to state within narrow limits the rates of interest, or the years purchase adopted for colliery valuations. 10 per cent. or 10 years purchase might be reasonable in a particular case for a "full" life colliery making fairly high profits, and a colliery making small profits might be worth 20 years purchase of those profits; but assuming that the estimated annual rental value was properly adjusted, the range of interest might be taken in pre-war conditions as from 8 per cent. to 12 per cent.

Total Capital Value.—Assuming that the general standard of valuation to be applied to collieries is the pre-war standard, but taking stores at current prices, and the breaking-up value of the plant at post-war figures, I estimate the capital value of the lessees' interests in the collieries at £150,000,000.

My estimate of the capital value of the lessors' interests in the coal mines and the capital value of the undeveloped coal seams is £90,000,000, making a total of £240,000,000 for the mines and minerals."

14,073. *Mr. Sidney Webb:* I gather from this very lucid statement that apart from the question of the actual income of a colliery or of a mineral property the essential feature in making your valuation is the rate of interest?—Yes, but the rate of interest must have a relation to the annual value adopted.

14,074. What I mean is, when you have got the annual value, and when that is accepted and is not in question, the capital valuation that you arrive at is very largely determined by the general rate of interest that you allow?—I suggest that the two must be taken together. One may take a conservative estimate of annual value and a lower rate for capitalising, or a higher rate of annual value and a higher rate for capitalising. If I may give an example, one might take an annual value of £500 a year and capitalise it at 10 per cent. Ten years' purchase would give £5,000. Another might take £600 a year on the 12 per cent. table, which gives 8½ years' purchase, and get £5,100; so that the two valuations are practically in agreement despite the fact that different annual values and different rates of interest are adopted.

14,075. I understand that, but what I am not clear about is, how far you are guided, in taking what you call a rate of interest for the particular purpose, by what is the current market rate of interest at the time?—Am I to understand by "current market rate of interest" the annual rental value of money on secured property?

14,076. Yes.—Obviously the annual rental value of money on secured property is the basis on which one would determine the rate of interest to apply to the particular case to be valued, adding to the ordinary rate of interest an additional rate of interest to cover the risk of the particular property.

14,077. Therefore if the rate of interest which you accept as your guide is 4 per cent., you would get a different valuation from that which you would give if the rate of interest had gone up to 5 per cent?—Undoubtedly.

14,078. I notice that you state here in these figures which you give us very usefully as a rough guide "in pre-war conditions," in one case, and in another case you say "on post-war figures." Taking the general standard of valuation at the pre-war standard, you are talking with relation to the rate of interest which prevailed in 1914?—Yes, having regard to the rental value of money invested in a secured property at that date.

14,079. Therefore, if you were doing it now (we may assume the rate of interest under similar circumstances has gone up) you would make a different valuation?—Undoubtedly a higher rate of interest would have to apply, other things remaining the same.

7 May, 1919.]

MR. THOMAS ALOYSIUS O'DONAHUE.

[Continued.]

14,080. These figures which you give us are in all cases the pre-war standard?—In all cases except the case where I make the proviso in making my estimate of the total capital value.

14,081. The break-up value of the plant. I think the only case where you have taken the post-war figure is in the break-up value of the plant?—Yes.

14,082. In all the cases of valuation you have given as instances, you are taking pre-war figures?—Yes, pre-war figures and rates of interest having regard to the rates in pre-war time.

14,083. May I ask you as to your practice. You have had to make various valuations for this purpose during the last year or two, probably?—Yes, I am continually engaged on valuations of mineral property.

14,084. Are you still taking this at the pre-war standard?—No; I am having regard to the present rate of money.

14,085. Therefore, the figures which you are giving us here on the pre-war standard for capital values would have to be reduced in proportion to the rate of interest having gone up?—I would not like to make that statement without making a good many qualifications.

14,086. At any rate they would have to be revised if you were making a valuation to-day?—Yes. I should have to revise them.

14,087. Then also in all these valuations you always assume that the Mineral Rights Duty and the Annual Increment Duty are paid and go on being paid?—In making a valuation of a property where the minerals were not in lease at 1909, and which have been leased subsequently, one would have to have regard to the probabilities of the duty being levied on that property, and make a deduction from the revenue to arrive at the capital value.

14,088. *Sir Leo Chiozza Money*: I want to ask you first whether you would be kind enough to give these estimates in your valuable last two paragraphs in more detail. Could you kindly give them to the Commission without repeating them now, and will you hand them in to the Secretary, so that we may all have them?—I have submitted already a schedule in which I have made the estimate of £150,000,000, and I can explain that in a few minutes.

14,089. Will you kindly do so?—I take the basis to obtain that capital value as 1s. a ton profit to the lessee. I divide the collieries into various classes, 40 years' life and more (that being a full-life colliery), 30 years' life, 20 years' life and 10 years' life, and I assume that those four classes would be fairly representative of the industry. I have capitalised that shilling for the full-life colliery at 12 years' purchase, which is practically the 8 per cent. table on a 40 years' life, and I have capitalised the shorter lives, 2d. of the shilling, at 12 years' purchase, and the remaining 10d. at 8 per cent. for the particular life.

14,090. Is that for the 30 years?—For the three classes of 30 years, 20 years and 10 years. I have now taken only the average line, but as a matter of fact to find out the full figures I have taken a series of cases from the one losing money to the one making 2s. 2d. a ton, and obtained the average of 12d. a ton. A colliery losing money obviously has some value. Therefore I have attributed a rental value to that, and I have attributed a rental value to each one from the one losing money to the one making no profits and no loss, and carried that up to the one making a shilling a ton, and then carried that on further to the one making 2s. 2d. a ton. Averaging those out gives 1s. a ton on the lot. The colliery making a loss must have a value, because it could be broken up to-morrow and realisation made on the plant, and therefore regard must be paid to that.

14,091. In the last paragraph you say that your estimate of the capital value of the lessors' interests in the coal mines and the capital value of the undeveloped coalfield is £90,000,000. How is that £90,000,000 split up between (a) valuation of the existing rents and royalties, and (b) undeveloped coal?—My estimate of the minerals which are in lease (of course, this is a rough estimate, because the

various terms are not before me) is something like £60,000,000 to £65,000,000. It should be understood in arriving at that that the annual rental value adopted for capitalising, taken in each individual case and added together, will give a much higher figure than the yield for the particular year on all cases, and, therefore, I take the capital value of the leased areas at something like 11 years' purchase of the net rents which have been received, although, as a matter of fact, the purchase price of the estimated prospective revenue may not be more than eight years' purchase. I take the value of the undeveloped minerals at about £20,000,000 to £25,000,000.

14,092. How is that arrived at, and what is the process?—We have already valued in the Department something like £10,000,000. The last figure published was for 1916, and it was £8,000,000 then for undeveloped minerals. I take £10,000,000, the amount we have dealt with now, as being probably one-half of the value of the undeveloped minerals.

14,093. Taking the geological map of the United Kingdom, how far does this valuation go? Does it go so far as the concealed fields, for example, or where does it stop?—The coal immediately adjoining a developed area has a value of, say, £20 an acre. As you go from that, mile after mile, the prices drop down until it comes to a position where there is no probability of the minerals being developed for the next 30 or 40 years, in which case, although the coal is known fairly accurately to be there, it has only a nominal value, possibly only adding £1 an acre to the surface, or less. When we get to that point, we assume that, although the coalfield exists beyond, it has not any considerable value at the present time, its value at the present time is merely nominal.

14,094. Have you this method mapped at all?—No, we deal with each case as it comes along.

14,095. You have not it mapped in zones of value?—No, we deal with each area as we value it. We have all the areas which we have valued laid down on the maps.

14,096. Would it be possible to supply such maps to the Commission?—I am afraid we have not authority to do that under the Finance Act, or to give any information.

14,097. *Mr. R. W. Cooper*: I gather from your last answer that, in assessing the value of minerals for Death Duty purposes, you do include in your valuation the valuation of undeveloped minerals?—All undeveloped minerals have been taken into account since the Finance Act of 1909, certainly.

14,098. Am I correct in supposing that Death Duty has been assessed in respect of the undeveloped minerals according to their values in the manner you have just described?—Since 1910, certainly.

14,099. I think your *précis* is pretty clear, but I want to be quite clear about it myself. Of course, there are two interests which you value; there is what you call the rental interest, and the lessees' profit interest. Is that not so?—Are you speaking entirely of the lessees' interest in the colliery now?

14,100. First of all, I am speaking of the minerals generally. There are two interests in minerals which are leased; there is the rental interest and the lessees' profit interest?—Yes.

14,101. And you have described to us how you arrive at the capital value of what I may call the royalty interest?—Yes.

14,102. Then under a separate paragraph you describe how you would arrive at the capital value of the lessees' profit or commercial interest?—Yes.

14,103. Now, as you have very fairly told us, it is a rough estimate for the purpose of giving general information to the Commission. I should like to know this. In arriving at your estimated value of £150,000,000, which is the capital value of the lessees' profit or commercial interest, that includes apparently colliery stores at current prices?—Yes.

14,104. And also includes the discounted value of the break-up value of the colliery plant?—Yes.

14,105. I gather from you that in arriving at that figure you have taken into account the change in the

7 May, 1919.]

MR. THOMAS ALOYSIUS O'DONAHUE.

[Continued.]

rate of interest since the war?—In arriving at the break-up value of the plant I have, and that is the only point in which I have had regard to present day figures, except the stores.

14,106. With regard to the other item of the valuation, I want to see exactly what the £150,000,000 includes. Do you see what I mean?—Yes.

14,107. I take it that the other item in your valuation is the capitalised value of the estimated probable average commercial profit of the lessee?—Yes. It is the estimate of the capital value of the lessee's interest or the equivalent thereto, where a freeholder is working his own coal.

14,108. Yes. Those cases of course on the whole are comparatively rare?—Yes.

14,109. Therefore if you were valuing for the State, assuming the State to be the purchaser, and you were valuing the collieries belonging to a company, those are the only assets belonging to this company which would be included in the valuation?—The colliery and the stores and the break-up value of the plant and any by-product plant or coke ovens which there might be.

14,110. That is, all means by which the profit which you are capitalising was created?—Yes.

14,111. The word "assets" has been used once or twice here in a loose manner, if I may say so. You would not include in that the value of the invested reserve funds of a colliery undertaking?—Reserve funds must be excluded, because in arriving at that valuation of £150,000,000 I have had regard only to the lives of the collieries and have excluded any redemption or reserve fund which might have been set aside.

14,112. Suppose I had a colliery worth on the basis of your valuation £500,000, but because I was a company I had another £500,000 of invested reserve represented by War Loan, which was the accumulation of past years' profits: they would not be touched by your valuation, would they?—No, they are excluded altogether.

(The witness withdrew.)

MR. RICHARD FREDERICK PERCY, Sworn and Examined.

14,120. *Chairman*: I think you are a mining engineer and a Fellow of the Surveyors' Institution?—Yes.

14,121. Have you had over 30 years' experience in the supervision of colliery leases, and have you been concerned in the estimation and calculation of mineral royalties for many large estates?—Yes.

14,122. Are you a mineral valuer in the employment of the Board of Inland Revenue, and have you been engaged on Estate Duty valuations of minerals, and, on the original valuations which have to be made under the Finance (1909-10) Act, 1910?—Yes.

14,123. Are you also a technical adviser to the Controller of Coal Mines?—Yes.

Chairman: I will ask the Secretary to read your evidence.

Secretary:

"The market value of unworked coal depends chiefly upon its quality and upon the length of time which must elapse before it will be required or brought into actual working.

The very existence of coal is always a matter of surmise. Coal cannot be absolutely known to exist until it becomes visible to the eye.

The existence of coal is, therefore, a subject of conjecture and speculation, and the present value of any supposed area of coal is governed by the strength of the conjecture or the measure of reliance that can be placed upon a surmise.

The degree of probability is really a Geologist's problem, but the time which must elapse before a specified area can be worked is an Economist's problem.

In a well-developed coal-field the degree of certainty of existence of coal under a specified area may be relatively great, while in the case of an area situated at a great distance from any working colliery

14,113. And the same observation would equally apply if I happened as a colliery owner also to be a shipowner. If I were the owner of ships, for example, and kept a separate account showing the profits those ships realised, those would not be included in your valuation?—They would be quite excluded; it is only what is on the colliery premises.

14,114. I only want it clear on the note. Of course you understand it and so do I.

Mr. Frank Hodges: Did I understand the witness to say it included coke ovens and by-product plant?

Mr. R. W. Cooper: Yes.

Witness: Yes, anything on the colliery premises.

14,115. Anything which would create the profit which you were capitalising?—Yes.

14,116. *Chairman*: Would you kindly do two things for the Commission? Sir Leo Money asked you to give certain figures and the method by which you get at them, and you were good enough to give them. No doubt they will appear on the Notes, but will you give us a memorandum as to that so that we can circulate it among the members of the Commission?—Yes, that is as to how the £150,000,000 is arrived at?

14,117. Yes, and the same with regard to Mr. Cooper. Will you give us in detail how the £150,000,000 is arrived at?—Yes.

14,118. And the £90,000,000?—I cannot give much more information about the £90,000,000 than I have already given, because I have not any more data. But I can with regard to the other.

14,119. Give what you can, and if you will send one copy to me, I will have it printed and circulated among the members of the Commission.

Sir L. Chiozza Money: I am sorry to interrupt, but with regard to the £90,000,000, I understood the witness said certain valuations had taken place on a method. Perhaps the witness would explain that method.

Witness: Yes, I will do that.

the degree of certainty may be relatively small. A buyer would give a much higher price per acre for the first area than he would for the second.

To calculate the present-day value of an unworked area of coal, the probable full royalty value of the coal when it comes into working is first estimated, and the resultant value is then discounted by the application of a suitable rate of compound interest.

The rate of compound interest may be 6, 8, 10, 15, or possibly even 20 per cent.

At 10 per cent. money doubles itself in seven years, and, if there is a delay of seven years before the Royalty payable upon coal can be obtained, the present value is only one half of what its future value will be.

Coal which has a Royalty value of, say, £100 per acre, but which will not be worked, say for 20 years, has only a present value of about £15 per acre. If the delay is 30 years, it is only worth about £5 per acre, and if it will be 50 years before it can be worked, it can only be worth to-day about £1 an acre, although it will eventually produce £100 per acre.

To value the Landlord's interest in coal which is already comprised in a lease, or is now being worked, it is necessary to ascertain what probable future income will be derived from its working, and then, by the application of an appropriate discounting rate of interest, the sum which any prudent speculator could be advised to give for the prospect of receiving the royalties is computed.

The valuation of minerals is not quite so simple a matter as I have here explained because there are technical questions relating to the replacement of the Capital by Sinking Funds and the allowances which should be made for the taxation of the Sinking Funds, but these points are only matters of professional detail.

7 May, 1919.]

MR. RICHARD FREDERICK PERCY.

[Continued.]

Under the Finance (1909-10) Act, 1910, a Mineral Rights Duty of 1s. in the £ was imposed on all royalties yielded from the working of coal which was on the 30th April, 1909, then already being worked or comprised in a lease, and Annual-Increment-Value Duty became chargeable on all minerals which subsequently came into working or became comprised in a lease.

The object of this Act was to place a special tax on Increment. Under the scheme of the Act a duty of 20 per cent. became payable upon all values in excess of an Annual-Equivalent of the original value as on the 30th April, 1909. In effect the State became owner of one-fifth share of the increment accruing upon all minerals not under lease or being worked in 1909.

The original value of all unworked coal had to be ascertained and for the purpose of making these valuations the boundaries of the mineral estates of the Kingdom have been ascertained, and the value of most of the unworked coal in the Kingdom (known to exist or surmised) has already been provisionally valued. There, therefore, exists at the disposal of the State a mass of information which would, in the event of the adoption of a scheme for the nationalising of minerals, be of very great value.

The value of all the coal at the present time comprised in leases or being worked by the proprietors can be roughly gauged.

Taking the average royalty at 6d. a ton on 240 million tons (net), the aggregate royalties would amount to £6,000,000 per annum. The total present-day market value of such an income might work out at 10 years' purchase (a price equal to 10 years' rent) (on 8 per cent. basis and an average life of 20 years), that is £60,000,000.

This is the approximate value of all the coal which is at present being worked. The present-day value of all the coal which is not at present being worked is much less, because the time when such unproved coal must come into working involves a period of delay or deference. I should approximately value it at £20,000,000.

It is not possible to state accurately the present value of all the coal in the Kingdom, as under any purchase scheme it would be the aggregate value of thousands of separate negotiations, or at least of many separate valuations, but it is fairly safe to place the total between the two extremes of £50,000,000 and £100,000,000 sterling."

14,124. *Mr. Sidney Webb*: I gather that your calculations necessarily depend on your taking what you call a suitable rate of compound interest in every case?—Yes.

14,125. And you say there the rate of compound interest may be 6, 8, 10, 15, or possibly even 20 per cent.?—Yes.

14,126. I understand that that figure is arrived at by taking into account what I may call the special risk of mining, and also the current rate of interest?—Yes, both.

14,127. Consequently, if we may assume the special risk of mining to remain unchanged, your valuation at any particular time would depend upon the current rate of interest?—It will vary with the current rate of interest.

14,128. I notice you give some figures towards the end, and I want to ask you whether those are worked out on the pre-war rate of interest?—Those are worked out on the prevailing rate of interest and the prevailing value of money in the market in the pre-war days.

14,129. I think it is common knowledge that the rate of interest has considerably increased as compared with 1914?—It has within my knowledge.

14,130. Accordingly these capital figures which are given here as arrived at on the pre-war rate of interest would have to be varied if you take into account the present-day rate of interest?—The present values would have to be considerably modified.

14,131. They would be modified in the direction of reduction, would they not?—At the present moment in the direction of reduction. If you would care to hear it, I would express an opinion upon the point.

14,132. If you please?—There is a distinct relationship between the value of a risky speculation and a safe speculation. Prior to the war a gilt-edged speculation, or at least a purchase of an annuity based upon a State security, might be a 3 per cent. rate. A speculation in a fairly risky colliery enterprise might be 8 per cent., so that there is there distinctly a difference of at least 5 per cent., which measures the risk that the speculator runs in placing his money. Now since gilt-edged securities and State securities have risen from a 3 per cent. to a 5 per cent. rate, there must be a corresponding rise in the rates of risky speculations. I could make it clearer perhaps by assuming that a purchaser is in the market, and he has money to invest. In pre-war times he may select from the safe 3 per cent. investments, or, if he has an element of speculation in his nature, he may take the 8 per cent. with its risks. To-day the second risk comes into competition and in rivalry with the 5 per cent. rate and a man who would prefer to take an 8 per cent. risk in pre-war time, as compared with a 3 per cent. safe investment, will to-day take the 5 per cent. safety in preference to the 8 per cent. risk; so that necessarily the rate of interest upon the speculative property must rise to some degree to correspond to the rise in the rate of money in the market, in other words, with the rate of investment upon safe speculations. That is the first point, but if you will allow me there is another very important point. The rent which is derived from royalties from a colliery investment is, under Income Tax rules, subject to the payment of Income Tax upon the whole of that income. Now it is quite obvious that part of the income from a mining rent is capital. The mining rent is not truly a rent at all: it is the price of the chattel, for the coal when it is sold is a chattel, and the landlord sells the substance and gets a payment which consists of two elements—the element of remuneration which he may fairly spend and the element of sinking fund which he must re-invest for the redemption of the original capital. Now the Surveyor of Taxes does not distinguish between those two elements, and therefore Income Tax is payable upon the capital portion of the income. In other words, the sinking fund is liable to payment of Income Tax. At the present moment with a short life, it is a very serious matter indeed. The result in a rough way is that the capital value is greatly depressed by the present 6s. in the £ Income Tax, where in pre-war times it was practically negligible. So that from that point of view the present value in minerals is also depressed. And, if I may quote a third instance, the influence of this Commission may have an extraordinary effect upon the value of the minerals in the market. If a man thinks he is going to lose his minerals he will unload at a low price. The landlord, who would have demanded in pre-war times 6 or 7 per cent. rate of interest, might possibly, if he felt a scare or was subject to fear, sell out on 10 or 12 per cent. Thus there are many causes which tend to lower the value of a mining speculation at the present time. Perhaps I may add this: I am expressing my own opinions; although I am permitted by the Board of Inland Revenue and by the Coal Controller and the Board of Trade to give this evidence, I am not authorised in any sense to represent them. It is my own opinion entirely, and I am responsible for this opinion to myself only.

14,133. Just to make it clear, you give a figure here based on 10 years' purchase of the royalties of £60,000,000?—Yes.

14,134. That, I gather, would be based upon pre-war rates of interest?—Yes.

14,135. You have actually said here in your proof what I think is a slip: "The total present-day market value of such an income might work out at 10 years' purchase (a price equal to 10 years' rent on 8 per cent. basis and an average life of 20 years), that is, £60,000,000." You do not mean that that would be the result of a calculation at the present day?—I admit the word "present-day" is used there in a technical sense. I meant present value as understood by an actuary.

7 May, 1919.]

MR. RICHARD FREDERICK PERCY.

[Continued.]

14,136. Not the valuation that would be in 1919?—No.

14,137. You point out that with regard to unworked coal, which has a deferred value, the present value of it is very much less because you say at 10 per cent. money doubles itself in 7 years?—Yes.

14,138. Consequently every rise in the rate of interest has a very alarming effect in diminishing the future value of coal?—Yes.

14,139. And the higher the rate of interest secured on good securities the lower becomes the present-day value of future coal?—Yes.

14,140. *Mr. R. H. Taverny*: I understand from what you say that the mineral value of the property diminishes as the number of years before which it is exploited increase?—Yes.

14,141. At about what period of time at the present rate of interest would mineral value become negligible?—I have already stated that in 50 years the deference of 50 years would reduce it to £1 per acre. Perhaps that is overstating it, because one should remember that no sensible man will give anything for any property from which he cannot derive income for 50 years.

14,142. *Sir L. Chiozza Money*: Would you care, having regard to those considerations which you stated to us, to make a post-war valuation to correspond to the figures which you have given in your memorandum?—I would not care to do so. It is impossible at the present time to do it, because we have not arrived at post-war times. I cannot foresee what will be the value of the market in post-war times.

14,143. I mean having regard to the current rate of interest at this moment?—I could make a valuation at the present moment, I think, but that would not show a post-war value.

14,144. I am speaking in the sense that I now express it, having regard to the present rate of interest. You could do that, could you not?—Yes. I should be inclined to raise the interest rate by one or two per cent.

14,145. *Mr. R. W. Cooper*: I presume your number of years' purchase will depend upon the average life or the life you are assuming, and it will be affected by it?—Yes.

14,146. In the illustration given by you in your *précis*, if the average life had been 30 or 40 years, then assuming for the moment that your rate of interest was right, there would be somewhat of an increase in the number of years' purchase?—Yes.

14,147. First of all, your values here are valuations simply of the royalty interest?—Entirely.

14,148. Have you, since the war began, made any valuation or agreed any valuations for Death Duty purposes?—Yes.

14,149. Assuming the case of what *Mr. O'Donahue* called a "full life," 20, 30 or 40 years, would you tell me how much per cent. you have taken in that case, assuming that was the normal case, and there was no special consideration affecting the case either way, up or down?—It is the rate of interest or the years' purchase which you require to know in modern valuations.

14,150. In what I may call war valuations?—Yes, in war times.

14,151. I should like to have that information?—In the course of my practice I have agreed on a higher rate of interest than I would have agreed to in pre-war times.

14,152. Will you tell me, assuming again a normal case of valuing a royalty interest, how much per cent. you have taken in war times?—From 8 to 10 per cent., where in pre-war times for the same estate I have taken 7 or 8 per cent. I have in my mind a fairly well secured rent.

14,153. That is what I am thinking of, and that is exactly what I wanted to know?—Yes.

14,154. In your *précis* at the bottom of the first column there are some words printed in italics. I assume that those words are intended to be something in the nature of a quotation, are they not?—No, it is mere emphasis.

14,155. I thought you were referring to the expressions which are similar in the Finance Act?—I

wanted to divide minerals into two classes—those which were being worked and those which were not—so that the parts in italics would correspond.

14,156. As you know, the Finance Act speaks of minerals comprised in a mining lease or being worked?—Yes, worked by the proprietors.

14,157. That is one class, and the Increment Value Duty applies to the other class. There is no Increment Value Duty charged in respect of minerals which in April, 1909, were either comprised in a mining lease or being worked. Is not that so?—Yes, that is so. I should say, to make it quite clear, that the Mineral Rights Duty was in lieu of it.

14,158. Yes, I agree?—So that a duty was imposed.

14,159. Yes; we are quite at one. The expression "minerals which are being worked," which is used in section 22 of the Act to which I am referring, and with which undoubtedly you are familiar, is defined by section 24?—Yes.

14,160. And this, I think, is the definition in section 24: "Whore any minerals are at any time being worked . . . all the minerals which belong to the same proprietor, if the minerals are being worked by the proprietor"—that is the freeholder?—Yes.

14,161. . . . "or which the lessee has power to work, if the minerals are being worked by a lessee, and which would, in the ordinary course of events, be worked by the same colliery . . . shall be deemed to be minerals which are being worked at that date"?—Yes.

14,162. Now you also use another expression which I want to clear up. You talk about annual equivalent value?—Yes.

14,163. There you are referring no doubt to the provision in that same section 22 (3), where the Act of Parliament, in the case of minerals which are not comprised in the lease or being worked in the sense defined by the Act (what I call unproved minerals), fixes the annual value at two twenty-fifths parts of the capital value?—Yes, that is 8 per cent.

14,164. *Sir Adam Nimmo*: I understand that the views which you express here are personal views?—Yes.

14,165. But I take it from the last paragraph of your *précis* that you regard the valuation of colliery undertakings or mineral royalties as a special problem by itself?—That the two form special problems?

14,166. No; they form a special problem apart altogether from the principle of nationalisation?—Nationalisation is not involved in the question of valuation.

14,167. So I understand. Do I understand your view to be that a general overhead valuation might be an unfair basis to take? Would you not require to have regard to individual positions in the light of all the facts surrounding these individual positions?—If it were necessary to compensate the individual owners, it would be equally necessary to make separate and distinct valuations for every separate property.

14,168. And you suggest that, I think, in your *précis*?—Yes.

14,169. I take it, in the case of colliery undertakings, you would require to deal not only with what we regard as assets, but with the financial potentialities of the undertaking?—Most decidedly; that is the principal thing to be valued.

14,170. That might not be represented simply by an overhead amount which was given on the basis of so many years' purchase of that undertaking slumped with the whole of the undertakings that were being dealt with?—It is quite clear in fairness the average rate could not be applied to individual cases.

14,171. Then I take it that probably you would agree that the proper way to deal with the whole question of valuation would be to refer it to a special tribunal that could go into the whole of the facts?—In my opinion that is a wise and proper thing to do.

14,172. And does that amount to this—that any personal views which are expressed about valuation at

7 May, 1919.]

MR. RICHARD FREDERICK PERCY.

[Continued.]

this stage might be regarded as premature, and as rather tending to prejudice any full and complete enquiry which might be made at a later stage, if that were so decided upon, in respect of the proper basis of valuation?—There is some truth in that. Of course everything that I say now has some future influence, and so has the evidence in every Commission.

14,173. Would you agree with me that probably this very important question of valuation would be best dealt with by referring it to a specially appointed

tribunal?—I think only experts are competent to make the valuation.

14,174. And that before such a tribunal a full and fair enquiry could be made?—It could be made.

14,175. Taking the whole of the facts into account?—Yes.

14,176. And getting the benefit of all the expert knowledge and advice which could be brought to bear upon so vast a problem?—It appears to be a highly proper proceeding.

(The Witness withdrew.)

JOHN GEORGE LAMBTON, EARL OF DURHAM, Sworn and Examined.

14,177. *Chairman*: I will read the *précis* of evidence to be submitted to the Coal Commission by the Earl of Durham, K.G., Lord Lieutenant of the County of Durham:

"I own the coal under 12,411 acres of land in the County of Durham.

All this coal is let, and is being worked or will be worked shortly.

For at least 100 years prior to 1896 I and my predecessors were amongst the largest colliery owners in the County of Durham. We not only held leases of coal belonging to others but we developed and worked a large portion of our own coal.

In 1896 I ceased to be a colliery owner by selling to a Company formed by Lord Joicey all my leasehold collieries and all my plant and machinery at all my collieries, both freehold and leasehold, and at the same time leased to this Company for 60 years the freehold coal worked by me. The tonnage rents payable by the Company for this coal were the same as those then being paid by me to the Ecclesiastical Commissioners for their immediately adjacent coal.

Neither I nor my father, who succeeded the first Earl of Durham, have ever prevented coal being worked by refusing to lease. One lease still current was granted by my father in 1867.

Of the 12,411 acres of coal owned by me and leased to Colliery Companies, my title deeds show that approximately 6,000 acres were bought within the last 100 years, 4,000 acres were bought between 1720 and 1820, and the remainder is ancient land owned by the Lambton family. Details of these purchases can be furnished by my agent if required.

I have had these title deeds examined, and they show that the purchase of the lands acquired since 1720 included the coal, the minerals being expressly mentioned, but even if this was not so, it is, I believe, the law from time immemorial that surface and minerals constitute one property, except as regards gold and silver, which belongs to the Crown.

Apart from these purchases, I or my predecessors have purchased over 1,250 acres of freehold land within the last 200 years, from which purchases the coal is expressly excluded by the deeds being reserved to the vendors.

In addition to the royalty rents which I receive for the coal which I own, I receive under the conditions of my mining leases certain underground wayleave, shaft rents, and surface wayleaves for the use my property is put to in bringing coals belonging to other people through it.

It may be argued that there is no justification for these charges, but the answer is that these charges were part of the bargain when the collieries were leased, and were agreed to by both parties as fair and reasonable.

Further, I own certain surface railways, which I let at a fixed rental to those who work the coal. In one case where coal, not belonging to the collieries I originally sold to the Company, is brought over my line, I charge ½d. per ton per mile for the use of my railway for such coal.

In 1913 and 1918 respectively I received:—

	1913.	
For royalty on my coal	52,890	4 11
„ underground wayleave, shaft rents, and surface wayleaves	4,272	5 7
„ rent on railways	1,778	14 8
	<u>£58,940</u>	<u>5 2</u>

1918

For royalty on my coal	35,620	4 6
„ underground wayleave, shaft rents, and surface wayleaves	3,027	13 7
„ rent of railways	1,875	0 0

£40,522 18 1

This represents in 1913 royalty rents on 2,338,604 tons or 5·424d. per ton. The underground wayleaves, shaft rents, and surface wayleaves were on 970,113 tons or 1·056d. per ton.

In 1918 the figures were: Royalty rents on 1,526,315 tons or 5·6d. per ton, and underground wayleaves, etc., on 670,793 tons or 1·083d. per ton.

All my royalty rents are at fixed tonnage prices, and not on a sliding scale varying with the selling price of coal, and average 5½d. per ton where I own the coal.

In addition I am entitled to 1,500 tons of coal free for the use of myself and my employees in each year.

These rents include payment for all the surface occupied by the colliery buildings and such land as was occupied by spoil heaps at the time of the leases and in many cases the land occupied by the workmen's houses.

The rent charged for the surface railways works out at about double the agricultural value of the land occupied.

In considering the amount of royalty received by me it must be borne in mind that at present the State charges on the amounts I receive—Mineral Rights Duty at 1s. in the pound, Income Tax at 6s. in the pound, and Super Tax at 4s. 6d. in the pound. Out of the balance (8s. 6d. in the pound) I have to bear the expense of supervising the working of the mines, of collecting the rents, and legal expenses.

Barriers separate one privately owned royalty from another, but leave and encouragement to work away such barriers is constantly given by my agents wherever in their opinion this can be done with general regard to the safety of my own and the neighbouring mines. Joint agreements between royalty owners for the working of barriers and for substituting others, which will enable more coal to be worked, are constantly being arrived at.

In all my leases there is a general clause allowing the Colliery Companies to acquire land for colliery purposes or for building houses on paying double the agricultural rent of such land for the term of their lease.

At the end of the lease such houses fall in to me, but in practice are always re-let to the Colliery Company at no increase of rent.

As tenant for life under my father's will, I have power to grant mining leases for 60 years.

It is submitted that the fact that I own this coal and receive rents for it induces me and my agent constantly to watch and see that all available coal is worked. If a Government official let the coal he would have no personal interest in getting as much coal worked as possible.

When circumstances arise, as they do from time to time, which lead the workers of the coal to apply for modification of their leases, such adjustments are made expeditiously and without red tape under the present system; whereas if the Government owned the coal the procedure would tend to be complicated, cumbersome, and dilatory."

7 May, 1919.]

JOHN GEORGE LAMBTON, EARL OF DURHAM.

[Continued.]

14,178. *Mr. Robert Smillie*: I suppose it may be taken the land which includes the minerals and metals is essential to the life of the people?—If you like; I accept that.

14,179. The people in a country cannot live without land?—They cannot live in the air—No.

14,180. The holders of land, provided a limited number of people hold the whole of the land, practically hold the lives of the people in the land at their disposal?—I do not accept that.

14,181. You do agree that the land is essential to the life of the people, but you will not accept the proposal that if the land in the country is in the hands of a limited number of people practically the lives of the people is in their hands only?—I maintain the lives of the people on my land are as safe and as happy as under any other form of ownership. It makes no difference to them whether I hold the land or not in that respect.

14,182. If the people cannot live without the land and it is in the hands of a limited number of people who say they own the land, is not the lives of the people in their hands also?—No.

14,183. Land is quite as necessary to life as fresh water, or air or sunshine?—Yes, or bread.

14,184. You cannot get bread without the land. The purposes of land, or one of its purposes, is to get bread?—That is a platitude.

14,185. You say you own the coal under 12,400 acres of land in the County of Durham alone?—Yes, it is all in the County of Durham.

14,186. I suppose you claim the ownership of the surface of the land also with the minerals under the land?—Certainly, in nearly every case.

14,187. Do you know whether the law of England allows any person to own land; to own it in its full sense?—I am not a constitutional lawyer. I consider my title to the land is established by the law of this country.

14,188. Do you know what Williams in his "Real Property," 12th edition, page 17, says, that the first thing a student has to do is to get rid of the idea of absolute ownership and such an idea is quite unknown to English law; no man is absolute owner of his land, he only holds an estate in them. Do you agree with Williams?—I do not agree with Williams, or I may perhaps say I have not read him. I know I am only tenant for life of this land.

14,189. You say you own it?—For my life.

Mr. R. W. Coeper: Is it quite reasonable to ask Lord Durham to give an opinion upon Williams on Real Property. If that is to be referred to, I must refer to other portions that explain the whole position.

Mr. Robert Smillie: Wait until your time comes. You are not acting as Counsel for Lord Durham. The Chairman will protect Lord Durham, if any protection is necessary.

14,190. Dealing with the land question, all land and tenements in England in the hands of subjects are held immediately or immediately of the King, for in the law of England we have not any subjects land that is not so held. Do you agree with Coke?—It is not fair to ask me questions without context. You take extracts from books and ask me if I agree with one particular paragraph.

14,191. Do you agree with the general proposition that no person can own land in England under the law but may possess it for a time?—I do not agree with that. I do not give an opinion one way or the other; I am not a Constitutional lawyer.

14,192. I am quoting a Constitutional lawyer?—I daresay you are.

14,193. Blackstone is a Constitutional lawyer?—Yes, quite right.

14,194. He says, "it being a received and undeniable principle of law that all lands in England are held immediately or immediately of the King." Blackstone is an authority?—Quite.

14,195. Do you deny his authority?—Do I deny it?

14,196. If they are correct, you cannot own the land which you claim to own?—That is your opinion.

14,197. If they are correct, I say, that no person can own land, then you cannot own land?—My family has owned the land for a great number of years and nobody has disputed our right to it.

14,198. We are disputing it now?—If you like to dispute it, there it is.

14,199. I will quote you another you may be acquainted with. There is a very old book, and there is a statement in it that "The earth is the Lord's and the fullness thereof." I am not exactly sure of the author, but it appears in the Bible, by which you have promised here to tell the truth and the whole truth. Would you deny that authority?—I prefer another authority, which says: "Render therefore unto Caesar the things which are Caesar's; and unto God the things which are God's."

14,200. That is the thing I want to be done at the present time. If the earth is the Lord's and the fullness thereof it cannot be the property of individuals?—Is this an ecclesiastical examination?

14,201. I am endeavouring to arrive at whether or not there is any person entitled to claim ownership in the minerals?—Will you repeat that?

14,202. I am wanting to find out if it is possible whether or not any individual or individuals is entitled to claim absolute ownership of the coal and the minerals under the surface of their land?—I have told you I do not know.

14,203. If you do not know, there is not any doubt in your *précis*. You say: "I own the coal"?—Yes, I have told you before that I and my family have owned the land and the minerals beneath for some time. I cannot see your object in quibbling like that.

14,204. It is you that is quibbling, not me at all?—Pardon me, I am not quibbling at all. I have stated three or four times that I consider I have a full and clear legal title to the land and the minerals under it which I own. What more can I say than that?

14,205. We are coming to the title directly?—Thank you.

14,206. You say you possess titles to justify your ownership of the land and minerals. Only a small portion of your owning dates a long way back. I take it a small portion of the land was secured as a grant from the Crown?—Certainly not that I know of.

14,207. I find here that out of 12,400 acres you say your title deeds show that approximately 6,000 acres were bought within the last 100 years; 4,000 acres were bought between 1720 and 1820, and the remainder is ancient land owned by the Lambton family. Was it purchased?—Are you deriving some deduction from what you read? Are you insinuating what I own, or the acreage I possess, in the County of Durham consists of 12,400 acres?

14,208. No; you possess, or hold, 12,000 odd acres of minerals?—With coal under it.

14,209. I take it you hold a considerable wider extent than that?—Yes.

14,210. The whole 12,411 acres of proved coal land is in Durham?—Yes.

14,211. And out of that 12,411 acres 6,000 acres were purchased within the last 100 years, and 4,000 acres were purchased between 1720 and 1820?—Yes.

14,212. What was held prior to that? Do you remember whether it was bought or not; that is to say, the land held prior to the purchase of those 10,000 acres?—How were the properties held?

14,213. The ancient Lambton family land—do you know whether it was a grant from the Crown?—I feel very sure it was not, or almost sure. I believe my family has lived there for a great many hundreds of years. There is no evidence to prove we ever had any land or property conferred upon us by the Crown or anybody else.

14,214. You say that you have had your title deeds examined and they show that the purchase of the lands acquired since 1720 included the coal, the minerals being expressly mentioned, but even if this was not so, it is, you believe, the law from time immemorial that surface and minerals constitute one property, except as regards gold and silver, which

7 May, 1919.]

JOHN GEORGE LAMBERTON, EARL OF DURHAM.

[Continued.]

belongs to the Crown. It has been stated here that your title deeds will require a large van to bring them to London to be produced. Do you agree with that statement?—Mr. Chairman, may I appeal to you for one moment? I should like it to be made quite clear I am not offering evidence. This evidence Mr. Smillie is examining me upon is answers to questions addressed to me by yourself or your Secretary.

Chairman: Quite right.

Mr. Robert Smillie: I take it this *précis* of yours is really answers to questions put to you by the Chairman through the Secretary of this Commission?

Chairman: That is right.

14,215. Mr. Robert Smillie: It is usual for witnesses in presenting a *précis* to expect to be cross-examined on the *précis*?—I have no objection to being cross-examined.

14,216. I want to examine or cross-examine you as fairly as I possibly can without any bitterness or feeling of any kind?—Now you want to examine me about a railway van, I think.

14,217. Mr. Cooper, I understand, acts for you in many cases, and he is a man above suspicion, generally speaking. Do you agree with him that it would require a large van to carry your title deeds? Would you consider that an exaggeration?—Not the least. I think Mr. Cooper, being a prudent man, would not put my title deeds in the penny post, but send them all up in a railway van.

14,218. If we ask you to produce them, do you think it would require a railway van to bring them?—A portion of a railway van, no doubt. There are a very considerable number of them.

14,219. There cannot be a considerable number of the kind of title deeds I am speaking about; that is the title deeds which passed on the purchase of those 6,000 acres of land?—Which touch on it?

14,220. The title deeds which passed when the transaction was carried through?—I do not quite follow you. I think I have about 30 in connection with these purchases mentioned in this proof.

14,221. The purchase of the 6,000 acres and the 4,000 acres. It should not require a van to hold those title deeds?—That is a matter of opinion.

14,222. And the size of the van, I suppose?—Very much so, yes.

14,223. With regard to the fact that you have had the title deeds examined, does it indicate you are in any doubt at all?—In doubt as to the validity of them?

14,224. Yes?—No, I have no doubt. I have never read them and I hope I never shall.

14,225. Was it only recently the examination was made—that you had your title deeds examined?—I believe that you, about a fortnight or three weeks ago, practically made a demand that my title deeds should be produced in this room.

14,226. That is so?—Then you caused a great deal of inconvenience to my agents and others in getting those title deeds to be sent up in a van or other means of transit to this House, otherwise they would have remained in their depository, where they have been for many years always available and accessible. I do not read them every Sunday, if that is what you mean.

14,227. They have not been sent up?—No, they have not been sent up.

14,228. They have been examined during the past three weeks?—I should not say they have had a very searching examination, which would take some time. I do not admit your authority. If the Chairman of the Commission says I am to bring my title deeds here I will bring them.

14,229. The Chairman may say that yet?—He might.

14,230. They are not just as extensive as we were led to believe if you could have had an examination made of them during the time that has elapsed since then. You say you do not read them yourself?—No.

14,231. Do you depend upon your agents to keep you right in matters of this kind?—On my agents and on the legal advisers of my family for many years past.

14,232. You might take it from me a good many people would be delighted to read from day to day

the title deeds if they could manage to secure any?—Possibly. You do not suggest I should give them my title deeds, I hope.

14,233. I am suggesting I had a feeling that you had not any title deeds which justify your ownership?—Oh!

14,234. That being the question, I would suggest the Commission might yet say you ought to give it back to the State, which is really the proper owner of it, if that is correct? You say "Neither I nor my father, who succeeded the first Earl of Durham, have ever prevented coal being worked by refusing to lease." Does not that answer postulate that you could, if you cared to, prevent coal being worked by refusing to lease?—I suppose it could have been done when the coal was not leased, certainly. I should certainly not dream of refusing to renew a lease.

14,235. It is not a point of whether you might or not. You might be a remarkably decent landlord?—How very kind of you.

14,236. I said you might be. That postulates your right to refuse to lease the coal which you hold, if you were to?—Oh, I have no doubt.

14,237. If you own the coal and have the right to refuse to lease it other landowners in your position might do the same?—I suppose so.

14,238. That might mean at the present time a comparatively small number of people could refuse to lease the coal of this country and consequently they hold the country in their hands to that extent?—You mean they are blackmailers?

14,239. I do not mean they are blackmailers; I mean they have the power to be if they care to be. I put it only as high as that?—A great many people have power to do mischief if they like.

14,240. Perhaps you do not fully grasp the importance of the question I am putting to you. I put it that if the landowners, or, as I prefer to say, the landholders of this country owning all the mineral lands in the country cared to refuse to grant leases they could stop the production of coal in this country on a new venture or on any expiring lease. Is that correct?—No, I think the State would intervene if there was a cabal against the working of coal.

14,241. You think the State would intervene?—I think it would be wise to.

14,242. If the landowners were sufficiently unreasonable you think a time might come when the State would intervene?—I think the State ought to intervene if there is a railway strike or a miners' strike if the rest of the population is suffering thereby.

14,243. I am sure you do. Consequently you think the State has the same right to intervene if landowners unreasonably withhold the power they possess to grant leases?—Yes. The State is all powerful, or ought to be.

14,244. You and your fellow landholders in the country hold perhaps a more important right; you could refuse to lease the surface of your land for cultivation?—Refuse to lease it for cultivation?

14,245. Refuse to let it for cultivation?—I have a perfect right to cultivate my own land.

14,246. I do not think many landowners do cultivate their own land?—Portions of it.

14,247. Your family worked many collieries at one time prior to the sale of the collieries to the Joicey Companies?—Yes.

14,248. I daresay that your company at that time—you held the collieries in your own hands—owned a very considerable number of colliers' houses; I mean houses owned by your Company in which the miners lived?—Yes.

14,249. The miners who worked there resided there?—Yes.

14,250. Have you read in the newspapers any of the evidence given before this Commission as to the state of the houses, the insanitary state and uninhabitable state of the houses in some mining districts?—You do not mean in the mining districts in Durham only?

14,251. I will come to Durham in a moment. I said in some mining districts?—In your own in Lanarkshire.

7 May, 1919.]

JOHN GEORGE JAMITON, EARL OF DURHAM.

[Continued.]

14,252. Are you aware that in Durham and Northumberland there have been very serious complaints about the condition of the houses?—Yes, in both counties housing conditions are not satisfactory. That is not only in connection with the miners, but the general population.

14,253. Would you say that the houses in which the workmen live who worked in the mines or at the mines when you were the proprietor were satisfactory; that is that their housing accommodation was satisfactory?—Yes, some of it is quite good.

14,254. When you say some of it, I take it that some of it was not?—Some of it was not as good as the rest, and since the war it has been impossible to build fresh houses.

14,255. I would like to deal with prior to nine years ago, if you please, Lord Durham. Prior to nine years I put it to you that many of the workmen in your collieries were housed under conditions which they ought not to have been housed?—No, I do not agree with you.

14,256. You say at your own collieries up to the time they were given over to the Joicey firm the housing conditions of the workers at your collieries were satisfactory?—Anybody understanding hygienic matters and the drainage system, if you like, will say they are better than they used to be. I agree the houses which were considered by the miners themselves and everybody else as quite reasonable 50 or 60 years ago would not be suitable now. I approve of good houses; I like the miners to have good houses. I must say I have known cases in which miners have had good houses and they have not made a very good use of them.

14,257. It might be it could truthfully be said that in a very few of the houses in which the miners were living you yourself would like to live in?—I should prefer to live where I am living.

14,258. You say in your *précis* that you give land to the mine owners who lease from you for building purposes at double its agricultural value?—Yes.

14,259. For their outbuildings and everything of that kind, for their tips where they put the rubbish, and also for the houses they may erect for their workpeople?—Yes.

14,260. I suppose you know the County of Durham and its surroundings very well?—Yes.

14,261. Might I take it that in the City of Durham itself there are a very large number of very bad miners' houses in which the people live?—I should think you are right on the whole, although I think the Corporation of Durham denies the fact. I cannot vouch for all the houses in the County of Durham—I am not responsible for them.

14,262. I would not like to hold you responsible. You have sufficient responsibility without that?—I can bear it quite lightly, thank you.

14,263. If it really came to your knowledge that there were very many people in the County of Durham on the estate which you hold, your own ground I mean, very badly housed, and the public authority or the Government made up their minds to improve the housing conditions by building, would you be prepared to give the same terms to them as you give to the colliery people, double the agricultural rent, for housing purposes?—Would it be fair, do you say?

14,264. Would you be prepared to do so?—No. There are land valuations and methods of finding out the value of land. I should be prepared to accept that. The local authority can purchase land now, and District Councils, and so on.

14,265. You give your income from royalties and coal in 1913 and 1918. There is a considerable falling off in 1918 as compared with 1913. I suppose that would be a falling off in output which would cause the falling off of the royalty rents?—Yes, I think the proof says so.

14,266. I think it does. The figures show that?—It gives the number of tons worked in 1918. It is 2,300,000 in 1913 and 1,500,000 in 1918—diminution of output.

14,267. I take it there are none of your royalty rents based on a sliding scale?—No.

14,268. They are all fixed when the lease is granted?—Yes.

14,269. Have you a dead rent in every case in your lease that in the event of the colliery not working the dead rent still stands? Could you give us a case in point?—I do not think I could.

14,270. I think it is fairly general to grant a lease in which there is a dead rent which takes effect as from the beginning of the lease, and if the output does not reach the amount of the fixed royalty the dead rent is charged?—I am afraid I cannot answer that question. My agent is here; I daresay he can tell you.

Colonel Stobart: There are certain rents in all leases. If any of those technical questions were referred to me, I daresay I can answer them.

Chairman: I will have Colonel Stobart sworn, and if any questions like this are put we can ask him.

Colonel HUGH MORTON STOBART, Sworn.

14,271. Chairman: Perhaps, Colonel Stobart, you can answer that question?

Colonel Stobart: Lord Durham has certain rents which amount to nearly £10,000 a year. We have practically no short workings at all in any of the collieries.

14,272. Mr. Robert Smillie: I take it, under the leases granted, generally speaking, supposing the colliery came under a certain output which would not give the royalty according to the dead rent, the dead rent would be charged?—Yes.

Colonel Stobart: Yes. The dead rents are fairly small and there are very few short workings.

14,273. If for one year the amount is lower and the royalty falls under the dead rent and the dead rent is charged, if the output increases the following year the reduction would have to be secured back?—They would work off their short working in every case.

14,274. I think, Lord Durham, you have not very much faith in the Government taking over and working the mines successfully?—No, I do not think they would do it very economically or successfully.

14,275. You say in your case that you or your agents are constantly there to watch and see that all available coal is worked, but you do not think that anyone employed by the Government, in the event of the Government taking over the minerals and the mines, would be so anxious to look after the working as your agents and yourself?—Not in my own locality in that particular area. I understand from your view of nationalisation, coal mines are to be worked all over the country on a sort of pooled system: where one colliery is not paying well that another colliery is to be worked more strenuously in order to make up the loss. Something of that sort, I understand, is suggested under the nationalisation system. In this case I think they would not be so effectively managed as now. As you know, Lord Joicey is now the coal owner, and the collieries are admirably managed under him and by his agents.

14,276. It is the proposal of those who favour nationalisation that the industry should be worked as a whole?—Yes.

14,277. And that collieries which might be less favourably situated, or the seams less easy to work, that the industry should be worked as a whole and to stand or fall as a whole. You are aware that is not the case at the present time?—Not all worked as a whole; of course I am aware of that.

14,278. You are aware that there are many collieries to-day which are called poor collieries; that is not because of bad management, but because of their situation and the nature of the seam?—Yes.

14,279. That it would be quite impossible that one colliery, however well it might be managed, could compete with another colliery managed just on the same lines. I think you know from experience that is so?—Yes, it would have to be run at a loss.

14,280. Of course at some period, if it were run at a loss, it would have to shut down?—Yes, it has been done.

14,281. You know that that has been the case?—Yes.

14,282. You know the tendency has been to fix the wages of the mine workers on as near as possible an

7 May, 1919.]

JOHN GEORGE LAMBTON, EARL OF DURHAM.

[Continued.]

average all over a county or all over a locality; that is, instead of the wages being fixed by colliery to colliery they have been regulated up or down under the prices shown over a large area?—Yes.

14,283. You know of that system?—Yes.

14,284. I put it to you the tendency under those circumstances is that the wages of the miners generally are likely to tend down to the ability of the worst-conditioned colliery?—Do you mean bad collieries bring down the average of the wages?

14,285. No?—I thought you meant that.

14,286. If the bad collieries are to be kept alive the general rate of wages paid to the men all over the coalfield must tend down to the point at which the bad colliery is able to go on?—I do not think that is an economic proposition. I do not think that would be done. I think the colliery would be let go if it were a very bad one.

14,287. Generally speaking the wages of the mine workers of this country have tended down to the ability of the worst situated collieries to pay or else the worst situated collieries have had to go out of action. Is not that bound to come?—I am not sure I agree to that. I do not think the miners' wages are very bad. I should not mind if they were higher in the least. I do not mind how high wages are if they can be economically paid. I do not think what you state really reduces their wages.

14,288. I am not complaining of the wages at the moment. I put it to you as I thought it was such a clear economic fact when you told me that badly situated collieries could not go on at a loss for a very long time. Badly situated collieries could not pay an increase in wages unless they themselves were ready to meet it, that is to say the collieries at the present time are not worked as a joint concern, as it is proposed to work them by the State, each worked on their own ability to stand. Is not that so?—Yes.

14,289. As a matter of fact, in a given colliery it might be that one district of a mine was not paying and could not pay, but it is not stopped because it is not paying, and it is worked as a whole and is helped by the other mines that are paying. Is not that so in practice?—You mean in a large mine?

14,290. Yes, or even a number of mines in one company. One mine might not pay its way and meet its expenses, but it is kept going and paid from a common fund?—Yes.

14,291. That is so in practice in large companies?—Yes.

14,292. Would there be any harm in extending that principle to nationalisation and working the mines of the nation as a whole under the Government?—You ask so many questions in one. I do not object to the principle you enunciate. I am not at all sure the Government would be the proper authority to carry it out successfully.

14,293. Do you mean you would not object to the principle of all the mine owners getting together, pooling their funds in the collieries and running the whole mining industry as one national concern?—I do not know about any other district than my own. I do not know much about that, I am afraid. In the County of Durham the coal owners are sensible people and do work together as much as possible.

14,294. Not I think you will admit on the lines we were dealing with of helping a poor colliery through. I think it has been said by you that landlords sometimes helped an individual colliery through if in difficulties. Now, it was said this morning by another witness that it was a very common thing for the owners of land to help collieries in difficulties by lending them money to tide them over?—I have not come here to advertise myself; but, as you ask me that question, I have done it myself. I have lent money to a colliery to help it to tide itself over a bad time.

14,295. You would be hopeful that it would get over the bad times and go on?—I should be hopeful of getting my money back.

14,296. Mr. Frank Hodges: Your average royalty works out at something like 6½d. per ton?—I think not; the royalty itself is 5½d.

14,297. The other charges make it up to 6½d.?—No

Mr. R. W. Cooper: The quantities vary. You must take them separately.

14,298. Mr. Frank Hodges: What is the factor that you use in arriving at that figure? Why do you charge that figure?—I suppose for the same reason that the Ecclesiastical Commissioners charge the same figure. You notice at the top of my proof I say the rents paid are the same as those paid to the Ecclesiastical Commissioners. I suppose it is more or less the custom of the county.

14,299. You do not know any fixed principle that determines the amount?—You mean percentage on the value of the coal, or something of that sort?

14,300. Yes?—No, I do not think there is.

14,301. As a matter of fact, the amount is fixed by what the colliery companies in the average are prepared to pay. Is not that the case?—That is hardly so. In my case it would not be so. I do not rush them up. I do not put them up. I remain at the fixed rent. They are very pleased to pay that, and they would not be pleased to have them doubled, I should think. It is a bargain between themselves and myself as to the price.

14,302. You think the Durham owners are pleased to pay this royalty?—Yes; otherwise they would not renew the leases.

14,303. Have you not on record any colliery company in Durham that has made application to you for a concession?

Colonel Stobart: If those technical questions come to me, I can answer them.

14,304. Mr. Frank Hodges: I thought that would be a matter within Lord Durham's own knowledge.

Colonel Stobart: This question relates to me. There are several cases in which Lord Durham has given a reduction. I do mention them to him at the time, but I do not know that he always bears them in mind afterwards. It is my daily business; we have often given a reduction.

14,305. Mr. Frank Hodges: Have you machinery whereby his Lordship was informed by any means that owners were pleased to pay and would be willing to pay double the amount?—(Earl Durham:) I said nothing of the sort. I did not say pay double the amount. I said 5½d. was reasonable, and they did not object to pay it. I said they would object to pay double that amount, and they would call me a bloodsucker, or some other name.

14,306. You went out of business in 1906 as a colliery proprietor?—Yes, I ceased to be a coal merchant.

14,307. If you had not leased your property to Lord Joicey you would have ceased to have drawn any revenue from the coal?—Do you mean from the collieries that have been leased?

14,308. Exactly?—Why?

14,309. You yourself went out of business, and you would not have leased them to anybody else?—I did not go out of business. Lord Joicey did not step in without a little arrangement between ourselves.

14,310. Exactly. I am assuming if you had not leased it you would have lost a valuable economic property?—I should have gone on working them myself if I had not leased them, of course.

14,311. Would you?—Obviously.

14,312. Why would you have gone on working them?—I really do not understand your question.

14,313. I put it to you it was a profitable proposition to go on working them?—Profitable?

14,314. Yes?—It varied very much in the four years previous to 1896. I had had some very bad years, and one reason why I leased my collieries was I had not sufficient money to spend upon them. That was my principal reason for leasing. I should have been very glad if I had had sufficient capital to put down. I wanted several hundred thousand pounds to have everything up to date. If I had had it I should have been glad to have gone on with the collieries. You seem to think I have no pride or interest in the people who live on my property. Mr. Smillie tried to make out I took no interest in them. On the contrary, I am most anxious these people should

7 May, 1919.]

JOHN GEORGE LAMTON, EARL OF DURHAM.

[Continued,

live well. I thought it a good opportunity when I found a very rich man, an eminent authority on coal matters, willing to lease these collieries; I thought it was good for, if I may call them, my people and good for myself.

14,315. Immediately these people's capital touched your property it became of economic value to you. You derived in 1913 £52,000 by that process; other people's capital applied to your property gave you an income?

14,316. *Mr. R. W. Cooper*: That does not include Lord Joicey only?—I call it a rent or deferred payment, really for the use of substance, I prefer to call it royalties on coal that belongs to me.

14,317. If you had found no excellent capitalist such as the one mentioned here you would have been deprived of your income?—I do not quite understand that question.

14,318. Without capital applied to your mineral property you cannot draw a royalty?—No one draws a royalty unless the coal is worked, I believe.

14,319. Exactly. The capitalist who put money into the property cannot get a profit unless he employs labour?—No.

14,320. So that, in short, the labour engaged in working the minerals gave you an income from the minerals and gave the capitalist an income from the minerals?—Yes, it gave, in my case, a return for the money which had been originally spent in buying the land or in starting the collieries. No doubt I and my forefathers spent vast sums of money in developing the collieries in the County of Durham, or that portion where I live, and it is very reasonable I should get some return for it. The bigger the return the better I am pleased, if it does not hurt anybody else.

14,321. It follows from your answer that if there were no workmen, who would exploit your mineral property, it would be economically valueless?—Yes. I believe if there were no people living in England it would be a desert island.

14,322. Who do you think has the prior right to any property, the man who makes it economically valuable or those who live upon its being economically valuable? Who do you think has the prior right, apart from law?—I do not think there is any prior right in the case. There is only one person who has the right to his property, and that is the man who owns it.

14,323. *Mr. Herbert Smith*: Have you a large extent of royalties in the Houghton-Le-Spring Division?—In the Houghton-Le-Spring Parliamentary Division, do you mean?

14,324. Yes?—Yes.

14,325. Did you work the collieries there yourself at one time?—Yes.

14,326. Why did you cease working them there?—I have just said why.

14,327. You have not said so, and that is why I want to know. Was it because they were not profitable?—You mean why did I give up working them?

14,328. Yes?—There were fresh shafts to sink.

14,329. Did you give them up because they were not profitable to work?—No; I do not know what you mean.

14,330. Was the coal in the Houghton-Le-Spring Division unprofitable to work?

Colonel Stobart: They were given up because they wanted a lot of capital spent upon them. There had been four or five bad years, and a rich man came along with capital, willing to spend it upon the collieries, so Lord Durham chose, possibly wrongly, to sell the collieries. It turned out to be a profitable speculation for the other side. That is the fortune of war.

14,331. *Mr. Herbert Smith*: Is it the fact you got royalties from the Hon. the Rev. John Grey?

Colonel Stobart: That was before my time. I believe Lord Durham did own some royalties.

14,332. *Mr. R. W. Cooper*: There was a small portion of glebe in Houghton-Le-Spring.

Earl Durham: You do not suggest I robbed my poor old uncle.

Mr. Herbert Smith: It is always a little unfortunate that Mr. Cooper should anticipate what is coming next.

14,333. Were there some royalties on this glebe land, a very big portion of glebe land at Houghton-Le-Spring?—It was not a big portion.

14,334. Tell me how much?—I do not know.

14,335. *Chairman*: Colonel Stobart, do you know?

Colonel Stobart: No, it was long before my time.

14,336. *Mr. Herbert Smith*: Is it not the fact you acquired the coal under the glebe land?—No doubt it can be discovered.

14,337. Cannot you tell me now?—I have told you I do not know.

14,338. Am I right in assuming or in picturing the Government if it agrees to nationalisation would know as little as you know about your own affairs?—That is not very polite. The glebe land has nothing to do with me in this way.

14,339. It has something to do with it?—I do not know the circumstances of the glebe land.

14,340. Is it a fact that you worked out all the main coal, the best seams, under this glebe land to the detriment of the incoming rector?—No.

14,341. And the future rectors—you worked out all the best seams under this glebe land?—To the detriment of the incoming rector? To the detriment of the income of the incumbent, do you mean?

14,342. Yes?—No.

14,343. Is it a fact by your working out all those best seams it would reduce the income to the incoming rector in the parish?—No. I think you mentioned the name of the actual clergyman there, did you not?

14,344. You bought him out for the time being?—Did you not mention his name?

14,345. I am talking about the incoming rector that follows him. Let me put it a bit further. Were the Ecclesiastical Commissioners aware of what you were doing under the surface?—I should think quite.

14,346. You think they were?—I should think so.

14,347. That is why the Ecclesiastical Commissioners always know what they are doing?—I cannot answer for them.

14,348. If I told you I knew 32 acres of coal had been got under the Ecclesiastical Commissioners' estate and they did not know it was gotten, what would you say to that?—You tell me that 32 acres of coal had been got? I said if it was got.

14,349. Yes?—Who by?

14,350. I am not saying you got it?—How can I answer about other people?

14,351. I am trying to find out whether you are one of these people who get coal unknown to the Ecclesiastical Commissioners?—You are suggesting that I am a thief. Thank you very much.

14,352. I do not know if you call it thieving. We are thinking somebody lived before you who stole for you this income before you got it. Am I right in saying that colliery owners and you are working jointly on this Commission? I had a letter sent to me, but it was sent to the wrong person and the last paragraph says: "I shall be glad to hear from you in reply the work we have to do and we are working in harmony with the colliery owners committee." It has come to the wrong person. I want to know if you are working in unity with regard to this person who has sent this letter to me?—I am not working with anybody. I had no idea I was to be called until Mr. Smillie made an application. I have had no consultation with anybody except my agent or solicitor.

14,353. *Mr. Robert Smillie*: You made a statement that you had no idea you would be called before this Commission until I raised it?—Yes.

14,354. Is that so?—Yes.

14,355. Is that true?—I beg your pardon. Even if I am not on my oath I object to being asked if a statement is true or not.

14,356. I did not intend to doubt your veracity. Is it not true you got a letter from Mr. McNair and you referred him to your agent long before I raised the matter here?—No.

14,357. I put it to Mr. McNair now?—You may be right possibly.

14,358. I do not think you are willingly trying to mislead any person?—I am not imputing anything to you or anybody else.

Chairman: I think what happened was this. We thought Lord Durham would be able to give valuable evidence upon this. Mr. Cooper then said he thought

7 May, 1919.]

JOHN GEORGE LAMBTON, EARL OF DURHAM.

[Continued.]

that Lord Durham probably did not know so much about it as Colonel Stobart, his agent, and we wrote to Colonel Stobart.

Mr. R. W. Cooper: I can explain it in a moment.

14,359. *Chairman:* We will read the correspondence—Mr. Smillie and I can get at it perhaps. I had a telegram or letter from Mr. McNair the day before Good Friday. I thought you had asked before then. If not, I apologise. It does not make much difference.

14,360. *Mr. Robert Smillie:* I did not ask before that.—I thought you had asked before that.

Chairman: The first letter is dated the 16th April, and is addressed to the Earl of Durham by Mr. McNair. It runs in these terms: "My Lord,—I am directed by Mr. Justice Sankey to inform you that, subject to the acceptance by the Miners' Conference to-day of the Government's offer of the terms contained in his Interim Report, the Commission will proceed immediately after Easter to consider the principle of nationalisation, upon which a report has been promised by the 20th May. In that connection it will be necessary to examine (1) the question of the nationalisation of the mineral rights, and (2) should that be decided on, the method of compensation to be adopted. The Commission would be indebted to you if you would be prepared to attend and give evidence before them on these two points on Thursday, the 24th instant, at a time and place which will be notified to you later. I must apologise for the shortness of this notice and ask you to be good enough to let me have, if at all possible, on Tuesday, the 22nd instant, a *précis* of your evidence, so that it may be printed and circulated to the Commissioners. I enclose for your information the following documents." Those are the documents which are sent to all witnesses. This is the reply: "McNair, c/o Cinduscom"—that is the telegraphic address of this Commission—"Your letter of the 16th instant received. As my agent is much more familiar with the subject in all its details than I am, I prefer that he should give evidence instead of myself. Please submit this to Chairman, and on your

wiring assent I will hand your letter to my agent with the necessary instructions. Impossible on your short notice at this season to let you have any *précis* by Tuesday. My agent absent until Monday.—Durham, Lambton Castle." The reply is: "Your telegram received. Shall be pleased to have your agent as witness. Please ask him to be ready by Thursday, 24th instant, and bring with him 50 copies *précis* of evidence to offices of Commission. Shall telegraph later if we can give him any later date." A further letter was written when the Commission could not meet quite so early. The letter was written to Lord Durham: "My Lord,—Referring to my letter of the 16th instant, your telegram in reply of the 18th, and my telegram of the 19th instant, I am directed by the Chairman to state that after further consideration the Commissioners will be indebted to you if you will be good enough, personally, to come and give evidence before them. I am, therefore, directed to ask you to prepare a short *précis* of evidence upon the following points:—(1) The acreage of your holding of land and of the proved mineral rights; (2) the total output of coal and other minerals to date; (3) the average annual output of coal and other minerals; (4) the royalty paid per ton, whether fixed or on a sliding scale; (5) the average annual income received by you from mineral royalties and wayleaves; and (6) the nature of the root of your title. I am unable to state definitely on what date you will be asked to appear, but it will probably be in the first half of next week." I do not think I need read any more.

14,361. *Mr. Robert Smillie:* That does not clear up the point?—There is no request in any of those letters with regard to my producing the title deeds. I got confused there. I thought he had asked for that before.

Mr. Robert Smillie: Lord Durham said he had no word about coming before this Commission until I had asked for the production of certain Peers. I want Mr. McNair to tell us the date of that; it was subsequent.

Chairman: You are quite right.

(Adjourned for a short time.)

14,362. *Mr. Herbert Smith:* In your evidence you say you are entitled to 1,500 tons of coal free?—Yes.

14,363. You get the best coal, I suppose?—I hope it is the best.

14,364. In addition to £35,000 that you get—that is an extra?—Yes, that is an extra.

14,365. Did I understand you aright, in answer to Mr. Smillie, to say that you were against the State taking the mines, because they would not carry them on as well as it is being done now—that in fact you were opposed to nationalisation?—I do not think it would be a success.

14,366. You finish up by saying that out of the balance you have to bear the expenses of working the mine, of collecting the rents and legal expenses. Supposing the mines were nationalised, could we not pay for supervising the mines and the legal expenses out of that?—Who is "we"—the State?

14,367. The State.—Yes, the State would have to pay a great deal.

14,368. Do you not think we could do it equally as well if we paid as good a salary?—I do not think that we should get the same men to do it.

14,369. I think we should. I daresay we should get your agent?—That is his affair.

14,370. You pay other people to do it?—Certainly—the best I can find.

14,371. And we shall only be paying similarly for people to do it, and the State would get this benefit. Do you not think the law is entirely wrong that you should have this monopoly of getting 5½d. a ton out of every ton of coal that is got?—No, I do not think so.

14,372. Do you not think it would be better applied to the men who have accidents in mines, so that they might have that money, and you might do some useful work like everybody else?—The miners do get compensation now for accidents.

14,373. They do not get enough. They do not get £35,000 a year like you do?—I get that.

14,374. You get yours for doing nothing?—Thank you.

14,375. Do you not?—I was not aware that I did nothing.

14,376. Did you put the coal there?—No, I did not.

14,377. Am I right in saying that you worked all the thick profitable seams out of Houghton-le-Spring while you were working there?—Those collieries have been worked for a long time.

14,378. Had you not practically worked all the good seams out when you finished being colliery owner?—Do you mean that I handed over a pig in a poke?

14,379. I mean you thought you were getting a better bargain by getting royalty rents. Is that not true?—No, I did not take that view of it.

14,380. Does that piece of railway belong to you that goes to Haswell Collieries?—No, not to Haswell.

14,381. *Mr. R. W. Cooper:* Mr. Herbert Smith asked you just now about your doing nothing. I am very unwilling to ask a question that may savour in any way of advertisement, but, as we all know, you are the Lord Lieutenant of the County?—Yes.

14,382. You take an active part in public affairs in the County of Durham?—Yes.

14,383. You have taken, if you will allow me to use the word, a very active part since the war began?—I have tried to do my best.

14,384. You have had a great deal to do with recruiting in the County?—Yes.

14,385. You have been a great deal among the miners?—Yes.

14,386. Who, we know, all responded exceedingly well in the County of Durham?—I think the miners volunteered for the war admirably.

14,387. In all matters of public duty that have been progressing during the last five years, whether from a civilian, military or naval point of view, may I not say that every member of your family, yourself included, has taken an active part?—Yes. They all

7 May, 1919.]

JOHN GEORGE LAMBTON, EARL OF DURHAM.

[Continued.]

offered to do anything that the State would wish to employ them for, and tried to do so.

14,388. As we know, unfortunately, you have in your family suffered losses through the war like other people?—Yes, certainly.

14,389. You are not a member of any association or combination of royalty owners in connection with this enquiry?—No.

14,390. You have had no consultation or communication with them at all?—No, I have not discussed the matter with them.

14,391. I will ask Colonel Stebart this question. You told us that Lord Durham's dead rents amounted to about £10,000 a year?

Colonel Stebart: Yes.

14,392. You also told us that as a matter of fact there were practically no short workings?—Yes.

14,393. Which meant that the lessors worked more than the certain rent?—That is so.

14,394. One of the objects is, is it not, for providing for the payment of a dead rent to promote the working of the coal?—Certainly.

14,395. In Lord Durham's collieries do they or do they not contain in addition to the dead rent a covenant by the lessee to work out all the merchantable

coal that can be worked?—All the recent leases that I have had anything to do with contain that covenant.

14,396. As regards the length of the term, Lord Durham has granted when requested the full leasing term?—Yes.

14,397. Do the leases contain an option for lessees to give up the lease on short notice?—Yes, they all do that.

14,398. In every case?—Yes.

14,399. Mr. Arthur Balfour (To Lord Durham): I think you agree that the State, whether they take over your royalty or take over any property in mines, should pay compensation?—Certainly.

14,400. In other words, if the rights of property are not respected in this country the whole credit of the country would be ruined?—It would lead to a state of chaos.

14,401. People would not trade with this country?—That is so.

14,402. We have had in Russia a very good illustration of what would happen when you do not regard the rights of property?—Yes.

14,403. It has made everybody miserable?—Yes.

(The Witness withdrew.)

WALTER FITZ URYAN, BARON DYNEVOR, Sworn and Examined.

14,404. Chairman: Lord Dynevor says: "The acreage of the Dynevor Estates in Carmarthenshire and Glamorganshire is about 9,300 acres. The acreage of lands under which there is coal is about 8,270 acres. The estate in Carmarthenshire is very scattered, and therefore the lettings to the different collieries are comparatively small. I regret that I am not able to state the total output of coal to date, as coal was being worked in 1541 and there are no available records. The average annual output of coal on my Estates during the years 1916-17-18 was 394,420 tons. The average royalty from coal for the years 1916-17-18 was 4-745d. per ton, being on a fixed basis. There is a small area of 425 acres of one seam only which has been sub-let by one colliery company to another, on which the royalty is 1/12th of the selling price. The average output of this sub-letting for the above three years was 40,000 tons, and the royalty £1,637. In 1912 the royalty payable by Main Colliery Company on the Glamorganshire Estate was reduced from a sliding scale of 1/12th of the selling price to 5d. and 4½d. per ton, which reduced my royalty by about £3,300 a year. In 1915 I foregave the Main Colliery Company £2,500 owing for royalties and wayleaves. I have not gained by the late rise in the price of coal, with the small exception mentioned above. The average wayleave, where one exists, for the above three years was 855d. per ton. The average annual income from royalties for the years 1916-17-18 was £7,543 12s. 3d., and from wayleaves £1,778 0s. 2d., without taking Mineral Rights Duty into account. The fourth Lord Dynevor, who died in 1869, settled the Carmarthenshire Estate by will and a portion of the Glamorganshire Estate, the other portion of that estate being already settled. As to the Carmarthenshire Estate, King Henry VIII. beheaded my ancestor Rice Griffith on Tower Hill in 1531 and seized his lands. My family bought the larger part of the present estate about 1600, and there have been various additions at later dates also by purchase. A small portion was left by Will by a Mr. Keymer to the third Lord Dynevor. My interest in the Glamorganshire Estate came to my family through one of three co-heiresses, Miss Hoby, who married my ancestor Griffith Rice in 1690. That estate was purchased from the Crown in 1541 by Sir Richard Crumwell. From 1541 to 1793 my predecessors worked the minerals and developed the industry, and must have spent considerable sums of money in doing so. I succeeded my late father in 1911."

14,405. The anthracite district is not one of the most prosperous districts in South Wales?—Well, I have not much knowledge of other districts, except my own, so that it is rather difficult for me to answer that question.

14,407. Would it surprise you to hear that it has always been regarded as the poorest mining district in South Wales?—I should be surprised to hear that. I should have thought that the anthracite district was more prosperous than the Glamorganshire district on my property, because the coal on my Glamorganshire property is half way between the anthracite district and the steam coal, and it is not a very good kind of coal.

14,408. It is dry steam coal, as it is described?—That is it.

14,409. In many cases in the dry steam coal district colliery companies have gone to the wall, have they not, just in that area?—I have not heard of one.

14,410. Do you not know that a large number of small colliery companies have tried and failed to carry on collieries there?—Not on my estate.

14,411. In that district?—I could not answer that question.

14,412. Are you aware that that is true of the anthracite district?—All the collieries on my estate are working.

14,413. Both in the anthracite district and in the dry steam coal district?—All, where there is coal let, are working.

14,414. I see your average charge on the royalties is somewhere about in one part 5d. and 4½d. You have abandoned the principle of the sliding scale in royalties, I believe, have you not?—With that one exception that I mention.

14,415. Have you had many collieries come to you to apply for concessions in the royalty?—Only this one that I mentioned.

14,416. Is that the Main Colliery Company?—That is it.

14,417. That is regarded as one of the biggest concerns down there?—I think so.

14,418. You relieved the burden a little bit?—I think rather considerably.

14,419. You reduced the charge by something like £3,300 per annum?—That is so.

14,420. Do you think it right that the Main Colliery Company should have to pay you 5d. and 4½d. a ton when they are struggling against natural difficulties in that colliery?—I am not sure that I know the natural difficulties you refer to.

14,421. First of all, the principal difficulty is the character of the coal, which often has a very poor sale upon the market. That is so, is it not?—At one

14,405. Mr. Frank Hodges: A good deal of your holding is in the anthracite district, is it not?—Yes, a good deal. I think nearly half and half; half in Glamorganshire and half in Carmarthenshire.

7 May, 1919.]

WALTER FITZ URYAN, BARON DYNEVOR.

[Continued.]

time, I think, that was so. I understood that they were in a much better position to-day than they were some little time ago.

14,422. Is that not due to the high demand for any kind of coal at this moment?—No doubt that has been of very great help to them.

14,423. Have you had any objection to the State taking over this mineral property, speaking now as an individual?—That is a very general question. I understand before the State could take it over it would be necessary to legislate, and I should rather like to see the Bill before I pledged myself.

14,424. Do you think that the State is competent to administer properly and scientifically the minerals of this country and get them worked efficiently?—At the present time I understand that the State does not like working its own collieries, and where it owns minerals it lets them and charges a royalty.

14,425. What properties do you refer to?—I had in my mind the Forest of Dean.

14,426. Of course, you are aware that the Forest of Dean is not regarded as a coalfield in the best economic sense of the term?—Yes, but I am rather surprised that the State has not tried its hand at working the collieries there and seeing how it gets on.

14,427. Has the State received any encouragement in that direction from any source, do you think?—I am not sure who you mean should encourage the State.

14,428. Do you think that the experiment in the Forest of Dean would be likely to be encouraged, in order that the State might show whether it could be successful or not, by other mineral owners, for example?—It is difficult to say that until they try.

14,429. You have an agent, have you not?—Yes.

14,430. Is he a mining engineer?—Yes. I ought to say I have two mineral agents.

14,431. You entrust, I suppose, the whole of the work in connection with these minerals to those gentlemen, do you not?—I always like to have a big say in the matter myself.

14,432. Do you, in fact?—Yes, they are always referring matters to me. I take a great interest in the question.

14,433. So that if a colliery comes and says that it is in deep water, you have the matter referred to you, and you give a decision?—Certainly, it would be referred to me.

14,434. But you act on their expert advice, do you not?—Naturally, I take their opinion very largely into consideration.

14,435. And if these gentlemen were the servants of the community or the servants of the State do you

think they would give the State as good an opinion as they give you?—I hope whoever their master was they would serve him properly.

14,436. Do you think they would?—I could not tell you.

14,437. You only hope they would?—I hope they would. I have no reason for thinking that they would not honestly and faithfully serve whoever they worked for.

14,438. Do you think that the anthracite districts of South Wales would be helped if there were no royalty charged upon the output there?—I suppose if you relieve anybody of a certain amount of out-goings it is an assistance to them.

14,439. *Mr. Evan Williams:* You have taken a very active interest in the management of your property yourself?—I do.

14,440. Wherever any company negotiates a lease you interest yourself in the terms of it?—I certainly do.

14,441. In the case of the Main Colliery Company, when they got into difficulties, was it on the advice of your agent or upon your own initiative that you made this reduction to them?—That was brought to my notice by my mineral agent; we discussed the question and decided to take off the sliding scale and have a fixed royalty per ton.

14,442. Is that the only case where a demand has been made upon you for a reduction?—I have only held the property since 1911. I cannot remember another one for the moment.

14,443. Do you remember having refused an application?—No.

14,444. I believe your estates have been held in your family from very early days; you are in fact descended from the Kings of South Wales?—As I put in my *précis*, the family lost the whole of their estates in 1531 when Henry VIII. cut my ancestor's head off.

14,445. So that your property was nationalised in a sense by Henry VIII.?—Yes, and I think the State owes me a great deal in return.

14,446. And you had to buy it back?—That is Carmarthenshire. In Glamorganshire my predecessor bought it from the Crown.

14,447. Except for that little incident, you would have held the property right the way back?—My ancestors before the beheading took place owned, I fancy, the larger part of Carmarthenshire, Pembrokeshire and Cardiganshire, whereas now I only own 9,000 acres.

14,448. The property that was bought back in 1600 was part of what you previously owned?—It was, I believe, a portion.

(The Witness withdrew.)

Mr. THOMAS EMERSON FORSTER, Sworn and Examined.

14,449. *Chairman:* Mr. Forster says:

"I am a Mining Engineer and Mineral Agent to a number of owners of mineral properties in the North of England, and have been in practice upwards of 35 years.

I have been requested by the Commission to give evidence on the following points:—

1. The nationalisation of mineral rights.
2. The method of compensation to be adopted should the nationalisation of the mineral rights be decided upon."

I will ask Mr. McNair, the Secretary, to read his evidence.

The Secretary:

"1. *Nationalisation of Mineral Rights.*

The present system of leasing coal properties in the North of England, so far as my experience goes, is satisfactory, and I do not consider that it is in any way detrimental to the proper working of the mines. Practically the whole of the coal contained in the true coal-measures in this district is now let, and there can be no further development so far as it is concerned.

I do not know of any coal areas which the owners have refused to let to responsible persons, my experience being that they are only too anxious to have their coal worked. I have never found any difficulty in settling fair terms as regards rents or otherwise, and have never had any complaint with respect to the terms of the leases, which are fair. I have never known any difficulty in renewing leases, generally for longer terms than were previously in force, and it is usual in the district for power to be given to the lessee to surrender his lease at the end of any year of the term on 12 months' notice. The leases stipulate that all fairly workable coal is to be worked and raised, and that has been the practice for many years, no coal being left underground. Power is also reserved for the lessor's agent to make inspections and see that the conditions are carried out. As a rule no internal barriers, *i.e.*, barriers between different properties worked to one colliery or undertaking, are now left, but only such as are necessary for the protection of the area attached to the field, and where possible faults are utilised as barriers so as to reduce the amount of workable coal left. I have never known any difficulty raised with respect to any proposal for the alteration or removal of unnecessary barriers. So far as the nationalisation of minerals is concerned I do not consider that it would have

7 May, 1919.]

MR. THOMAS EMERSON FORSTER.

[Continued.]

any material bearing on the district, which is already fully developed and laid out.

In case, however, any questions should at any time arise with regard to the terms of the leases or matters in connection with development or working under them which cannot be settled directly between the lessor and lessee, I think it would be advantageous to establish a tribunal having power to appoint an umpire to decide cases of this description.

2. Method of Compensation.

With regard to the question of the method of compensation to be adopted should nationalisation of the mineral rights be decided upon, I am of opinion that the owners should be paid full and adequate compensation for the loss of their property.

I think that the amounts to be paid should be ascertained by a separate valuation in the case of each property, and that probably the best method of carrying out the valuations would be the appointment of a certain number of representatives on either side in each district with power to appoint an umpire in the event of their being unable to agree in any particular case or cases. I do not think that there should be any difficulty in carrying out the valuations in this way."

14,450. *Mr. Robert Smillie*: You say that you have never known any difficulty raised with respect to any proposal for alteration or removal of necessary barriers. What do you mean by that exactly? Do you mean after the barriers have been left in there was no objection to have them taken out?—If they were buried up they could not be got out, but when in the course of working the barrier has been reserved by the lease, and it has been pointed out either by the lessee or the lessor's agent that arrangements could be made to remove that barrier, perhaps by substituting a fault instead, on going to the lessor I have never known the lessor make any difficulty about it. Naturally, he is going to get his rent on the barrier, so that it is to his interest to have as many barriers worked as can be.

14,451. Do you agree that the private ownership of minerals has led to the leaving of barriers between two estates, and that those are irrecoverably lost to the nation?—That might have been so in days gone past, but it is not the case now. The barriers are now only left between the different fields of coal which are worked by different colliery companies. The country, you might say, is divided up into different areas, and between each area a barrier is left, and that barrier is a necessary barrier.

14,452. Why necessary?—Because you must have the separation between the collieries for the purpose of keeping the ventilation intact. It is dangerous to have your ventilation mixed up together, and you must have certain barriers. That is the practice in every district of every county.

14,453. You say it is necessary to have barriers for the purpose of keeping out water from one colliery to the other?—Yes.

14,454. And those barriers are left in every case for that purpose?—Yes.

14,455. Have you known any barriers left in not for that purpose but merely as a dividing line barrier between two estates?—No, I cannot say I have. Of course, it might be possible that you might leave a barrier—it would be a very small one—for the purpose of ventilation.

14,456. You are a mining engineer?—Yes.

14,457. You have read up, I daresay, the history of mining in this country?—Yes.

14,458. You are pretty well acquainted with the history of mining outside of Northumberland and Durham; do you say now that you do not know and have not read and are not absolutely acquainted with the fact that there have been millions of tons of barriers left, not for the purpose of keeping out water, but for the purpose of dividing the properties of two landlords?—I am speaking about Northumberland and Durham. I cannot speak about anywhere else.

14,459. We are dealing with a national question?—Yes.

14,460. We are dealing with a fact that is well known to you—that there have been millions of tons of coal left underground which will never be recovered, merely because of the fact that the mineral rights are owned by different people?—I could not say that.

14,461. Have you read of such a thing in your mining experience?—No.

14,462. You say there is no objection to taking out barriers between two mineral owners of an estate, provided both are agreeable?—Yes.

14,463. Have you heard of narrow ribs being left in in Northumberland and Durham between two mineral owners' estates, not to keep out water, but merely as a rib between the two estates—barriers 10 yards wide?—I have known a 10 yards barrier.

14,464. Was the purpose of a 10 yards' barrier to prevent the flooding of one mine from another?—That was the original intention. Of course, they were very shallow.

14,465. A 10 yards' barrier would not be surely a safe barrier against flooding from one mine to another?—That 10 yards would be 10 yards on one royalty and 10 yards in another. That would be equivalent to a 20 yards' barrier. I have never known anything less than that.

14,466. That is 10 yards on each side of the line dividing?—Yes, and that, of course, was at a very shallow depth.

14,467. Have you known the loss of coal from other causes than barriers—because of disputes between two neighbouring landlords?—Never.

14,468. You have never known of that?—No.

14,469. *Mr. Herbert Smith*: You say in your evidence: "So far as the nationalisation of minerals is concerned I do not consider that it would have any material bearing on the district." Are you talking there about Northumberland and Durham always?—Yes.

14,470. You are confining your attention to that?—Yes.

14,471. You have no objection to everybody else being nationalised except Northumberland and Durham?—No, I am simply giving my evidence as to Northumberland and Durham.

14,472. You do not object to anybody else being nationalised and leaving Northumberland and Durham out?—Yes, I would not be so unkind to them.

14,473. Do you know Seaton Delaval Colliery in the north?—Yes.

14,474. Do you know that for about 8 years at one of the collieries they paid no dividend, and they paid £23,000 in royalties? Is that not something to complain about?—I do not know that.

14,475. Would it not be wrong if it were so, that the man who did not put the coal there drew £23,000 and the man who went to seek it lost twice as much money?—Probably he got it back afterwards and something more.

14,476. There is no record of his getting it back afterwards?—You put a case to me that I do not understand.

14,477. You tell us you do know about Northumberland and Durham and I am talking about Northumberland and Durham?—I cannot say that I know all about the dividends that are paid by the companies.

14,478. Do you know Axwell Colliery?—Yes.

14,479. Do you know a piece of line that runs over about an acre of land?—No.

14,480. Where there is a wayleave paid of £9,000?—No.

14,481. Do you think that is just?—I do not know about it. One does not know what is paid and what is not paid. I have not gone into such small details as that.

14,482. Have you not known bigger barriers than 10 yards on each side?—Yes.

14,483. Do you know barriers of 40 yards on each side?—Yes, I know the Crown coal reserve 100 yards barriers.

14,484. It is not always necessary to leave a barrier in for ventilation?—In our district it is.

7 May, 1919.]

MR. THOMAS EMERSON FORSTER.

[Continued.]

14,485. Your district must be a separate district from anyone else's?—Probably in the deep mines of Yorkshire it is not, but in Northumberland they are not so deep.

14,486. We work a shallower mine in Yorkshire than in Northumberland and Durham, while, on the other hand, we also work deeper?—We work right up to the outcrop.

14,487. We have mines 50 yards deep with outcropping, and mines over 900 yards deep, and it is not necessary, for the ventilation, to leave barriers in?—That is in Yorkshire.

14,488. I want to put it seriously to you; are there not barriers between Northumberland and Durham to prevent one man going into another man's territory?—I never heard of such a suggestion.

14,489. Suppose I give you some cases?—I never heard of it.

14,490. Do you not know, as a fact, that they do leave them between each other's territory for that reason?—No, I do not.

14,491. *Sir Adam Nimmo*: I think you are an engineer of very large experience in the north?—Yes, I have had very long experience.

14,492. You have a very full knowledge of the general colliery operations over the whole of the district that you are in?—Yes.

14,493. And you are able to speak from a very thorough knowledge of the whole of the detail work?—I have a very good general knowledge of the district.

14,494. Your view in the light of your knowledge and experience is that the present system of working the coal there has been quite satisfactory?—Quite.

14,495. In fact, you go so far as to say that the whole of the coal areas that are known are occupied and are being operated upon just now?—Yes.

14,496. And that by private enterprise?—Yes.

14,497. So that as far as that particular district is concerned you could gain nothing whatever by nationalisation from the point of view of operating more fully over areas that are now disclosed?—It is fully developed now, and nothing more could be done.

14,498. And that has all been brought about by the efforts of individual operators?—Entirely.

14,499. You have been asked a good many questions by Mr. Smillie about barriers. I take it that the desire of the mineral owner will be to have as much of his coal worked out as possible?—Naturally.

14,500. Have you ever found a mineral owner who from mere caprice allowed his coal to be left in?—No, not in our district.

14,501. Has he not, as a rule, very good reason for leaving it in?—Yes.

14,502. Would he leave barriers in unless he had very good reason for believing that they ought to be left in?—Certainly not, because he loses revenue on them.

14,503. He loses the revenue from his property?—Yes.

14,504. I take it that the two main reasons for leaving barriers in are to secure ventilation and to have protection against the encroachment of water?—Yes.

14,505. Do you lay any considerable stress on the question of ventilation?—Yes.

14,506. Vory considerable stress?—Yes, certainly.

14,507. Is it possible to say in an off-hand way in dealing with the question of barriers, what barriers could be extracted and what barriers could be left in?—No, you could not possibly say it in an off-hand way.

14,508. Would you not require to deal with each individual case on its merits?—Yes, entirely.

14,509. Do you think the extent of the problem of coal left in barriers is really known?—Certainly, it is not.

14,510. Is there not to a great extent surmise in connection with that problem?—Yes.

14,511. No doubt you would agree that there is coal being left in in barriers which might be extracted?—I would not like to say that without going thoroughly into it.

14,512. Would you say that you would require to investigate each individual case in the light of the facts surrounding it?—Yes, I would.

14,513. I take it you will agree that it is in the interests of the country that as much coal should be taken out as possible?—Yes, entirely.

14,514. And if a proprietor would not allow his coal to be extracted, I take it that in the interests of the community you would suggest that some pressure should be brought to bear upon him?—Most certainly.

14,515. Do you think it is necessary to nationalise either the coal or the collieries to secure that result?—No, I do not think it is.

14,516. Would it not be possible to set up a very simple form of tribunal under which an application could be made in the event of a situation of that sort developing?—Yes, I can imagine that might be done.

14,517. Do you go so far as to say that that form of machinery might reasonably be adopted in the national interests?—Yes.

14,518. And would meet the situation without creating many of the evils which are bound up with nationalisation?—Quite so.

14,519. Do you think that there has been up to the present any, what I might call, public demand for the release of all this coal that has been referred to. Has the question arisen in any acute form before this Commission was set up?—Not to my knowledge. Speaking for my district I have never heard of any coal being held up.

14,520. Would there not be a suspicion that this kind of argument is being used as so much padding in connection with the question of nationalisation?—That might be.

14,521. Coming to the question of valuation, I take it that your view is that any kind of overhead valuation, either of minerals or of colliery properties, would not be sound?—What do you mean by an overhead valuation?

14,522. A kind of general view of the whole position, and lumping it?—I think that would be quite unfair.

14,523. Your view is, it might require to be dealt with by a detailed investigation, and a valuation following upon that investigation?—Yes, on each property.

14,524. You suggest that a kind of tribunal could be set up which would be, I take it, a tribunal in districts?—Yes.

14,525. Do you think that would be adequate to deal with the position that would arise?—Yes, think that could be done without any great difficulty.

14,526. I take it that your view is that there ought to be a very complete investigation into all the factors surrounding the position in determining the question of valuation?—Yes.

14,527. And that that should be done in light of the facts existing at the time?—Yes.

14,528. *Sir L. Chiozza Money*: *Sir Adam Nimmo* has put a series of propositions to which you assented; have you ever considered them before?—Yes, I think I put it in my *précis* that I propose to have a tribunal.

14,529. I understood you, in your earlier evidence, to say that things were very perfect in Northumberland and Durham?—I said we had had no trouble, as far as my experience went.

14,530. No difficulties?—Yes.

14,531. Does that not mean that it is nearly perfect there?—No, not necessarily.

14,532. If you had heard of no troubles and no difficulties, why do you so readily assent to the setting up of an expensive Mining Department to deal with questions that you say do not exist?—I said: "In case, however, any questions should at any time arise with regard to the terms of the leases or matters in connection with development or working under them which cannot be settled directly between the lessor and lessee, I think it would be advantageous to establish a tribunal having power to appoint an umpire to decide cases of this description."

14,533. You know that *Sir Adam Nimmo* is one of the signatories to a report which makes a recom-

7 May, 1919.]

MR. THOMAS EMERSON FORSTER.

[Continued.]

mendation with regard to the setting up of a Mining Department which would have to employ expensive officials. Do you not think that that would be rather an expensive process?—If you had a department like that, it would be, but I am not advocating anything of that sort.

14,534. You assented to every one of the propositions that Sir Adam Nimmo put to you: you said Yes to every one of them, hardly waiting till he had put the questions. May I ask you whether you have considered those questions before?—Yes.

14,535. Why do you suggest setting up such a tribunal?—I said that personally I did not think it would be necessary at the present moment.

14,536. If this Mining Department and all its officials set to work to find coal, making surveys of coal areas in the United Kingdom, do you think it equitable that the landlords of this country should draw royalties upon work that the State has done through its officials?—Now you are getting rather off my ground. That is hardly a mining question.

14,537. You do not feel competent to assent to that so readily as you assented to Sir Adam Nimmo's question?—No, I have not considered that.

14,538. *Mr. R. H. Tawney*: I understand your argument is that the mineral owner has not obstructed development in any way. That is your argument?—Yes, I think that is a fact. He is always too pleased to get his coal worked.

14,539. Does he take part, *qua* mineral owner, in promoting development? What does he do?—As a rule he does not do anything, except if a man came to him wanting to take a royalty he would let it to him at a low rent to help him out; but he does not explore. I know of one case in Durham where a mine has been given up and the lessor went to a great deal of expense in putting shafts right. That was on Lord Eldon's estate.

14,540. It is the ordinary rule for the lessor to explore the property?—No.

14,541. The assistance that he gives is in letting the land bearing minerals?—Yes.

14,542. That is to say, the assistance which he gives is really doing nothing?—Yes. He allows them to come and put the boreholes down if they like, and everybody is quite ready to do it.

14,543. Allowing them to put their boreholes down does not sound a very strenuous form of work. He is paid a considerable sum every year if the colliery is successful?—Yes, if the colliery is successful.

14,544. *Mr. Evan Williams*: In Northumberland and Durham there is a long stretch of under-sea minerals which belong to the Crown?—Yes.

14,545. So there is a large area of national mineral-let in those two counties?—Yes.

14,546. Is it let to different colliery owners?—Yes.

14,547. Has the Crown in letting these areas stipulated as to a barrier between two properties?—Yes.

14,548. Of what magnitude is that barrier as a rule?—Generally speaking, 100 yards between two takes, as we call them. That is equivalent to 50 yards on each side of the boundary.

14,549. So that with national minerals in that way the practice has been exactly the same as in private ownership?—The Crown barriers are, if anything, rather more; that is in my own experience; certainly they are as much.

14,550. So that the Crown has been as great a sinner as any private owner?—I should not say that they were a sinner. They are acting on advice.

14,551. Do you suggest if there were a large area belonging to the Crown or anyone else that it would be possible to let different areas without leaving in barriers?—No.

14,552. Do you think that anything that can be done in the future will enable the barriers that have been left in the past to be recovered?—Not in my district.

14,553. Is not all this question of the barriers being left in the past crying over spilt milk?—The old barriers are gone.

14,554. *Mr. R. W. Cooper*: You not only act for the owners of mineral properties, but you yourself are interested in working coal, are you not?—Yes.

14,555. In Durham and Northumberland?—Yes.

14,556. You know the Durham and Northumberland coast pretty well, beginning at Amble on the north and going to Hartlepool on the south?—Yes.

14,557. I understand you to say that the whole of the Crown coal between those points is let?—The whole of the Crown coal that is known to be workable is let.

14,558. Do you know what is the royalty per ton charged by the Crown?—Now about 4½d.

14,559. Do you know that the Crown charge an underground wayleave rent on coal belonging to others passing through the Crown coal?—There is as a rule none; the Crown coal being out at sea, there is nothing beyond. I have only known one case where they did that, and it was a little piece of land coal that was brought round, and they just charged the ordinary wayleave.

14,560. What do you call the ordinary wayleave rent?—About ½d. a ton.

(The Witness withdrew.)

WINDHAM THOMAS, EARL DUNRAVEN, K.P., Sworn and Examined.

MR. JOHN MORGAN RANDALL, Sworn and Examined.

"For the management of my estate I employ my agents and solicitors, who furnish me with full details and reports, and on their advice I base my decisions as to its management and development, and give instructions accordingly, and the evidence which I submit to the Commission is based, therefore, on this information and these reports.

My answers to the points on which the Commission requires evidence are as follows:—

(1) The total surface acreage of the Dunraven Estate is 26,443 acres.

The acreage of the coal area is 17,602 acres.

(2) This, I am afraid, it is impossible to answer without further details as to what the Commission require, as the coal on the estate has been worked for many years and it would require considerable research to ascertain the total output of coal that had been worked up to date.

(3) It is impossible to answer this for the same reason, but I have taken the output of coal for the year 1918, which was about an average year and amounted to 2,318,248 tons, and I could, if desired, furnish an average, of three or four years, but it will take some time to get this out

The value of the other minerals on the estate is so infinitesimal that I have not thought it worth while to give particulars.

(4) The average royalty per ton on fixed and sliding scale is 6d.

There is only one colliery where the coal is let on a sliding scale, and there the sliding scale works out at 11d. per ton.

(5) The amount received from coal royalties and wayleaves for the year 1918 was £58,854 from royalties, and £5,516 from wayleaves.

(6) The bulk of the Dunraven Estate was purchased by the Edwin Family in 1684-5.

In 1810 my grandfather, Windham Henry, Second Earl of Dunraven, married Caroline Wyndham, daughter of Thomas Wyndham, who was the son and heir of Charles Edwin, and Thomas Wyndham settled what is practically now the Dunraven Estate on my grandfather and his heirs in tail male, and this settlement specifically mentions the mines and minerals.

Under two subsequent re-settlements of 1836 and 1866 I am now tenant for life of the estates and minerals."

7 May, 1919.] WINDHAM THOMAS, EARL DUNRAVEN, K.P.—MR. JOHN MORGAN RANDALL.

[Continued.]

- 14,561. *Mr. Frank Hodges (To Lord Dunraven)*: At which colliery is the sliding scale system still in operation?—Glyncorrwg.
- 14,562. *(To Mr. Randall)*: Did I understand his Lordship to say that at the Glyncorrwg Colliery the sliding scale is still in operation on royalties?—Yes, the Glyncorrwg Colliery working the No. 2 seam.
- 14,563. No. 2 Rhondda?—The No. 2 Rhondda seam.
- 14,564. And it works out at 11d. a ton?—It works out at 11d. a ton on the 1918 figures.
- 14,565. Can you tell me the average amount of profit per ton that colliery earned last year?—I cannot tell you.
- 14,566. Would it surprise you to learn that it was less than 1s. a ton?—I know nothing about it.
- 14,567. Do you not ever make comparisons between the amount of royalty you get out of a concern and the amount of profit the proprietor gets out?—I never know what profit the proprietor does get out.
- 14,568. I put it to you that the amount of royalty there is equivalent if not in excess of the amount of profit?—I do not know that.
- 14,569. Did you know the Bryncethin Colliery Company?—Yes.
- 14,570. Did you take royalties from that taking?—There is no Bryncethin Colliery now in existence.
- 14,571. Did the Bryncethin Colliery Company work a portion of your minerals?—Yes.
- 14,572. Did that company abandon the take?—Yes.
- 14,573. But before it abandoned it did it send a deputation of its Secretary and Management to interview you with regard to getting a substantial concession with regard to the amount of royalties they had to pay?—I had various interviews with Mr. Coppo, who was then interested in it, and considerable concessions were made.
- 14,574. *(To Lord Dunraven)*: Did you know about those things? Were you aware of that?—Yes.
- 14,575. Do you know the amount of royalty that the Colliery Company was paying at the time they had to abandon the taking?—No.
- 14,576. *(To Mr. Randall)*: Do you know?—I cannot say for certain, but I think it was 4d. or 5d. There was a reduction made to a very much lower figure than the old royalty. Lord Dunraven also made a contribution towards the installation of the electrical plant at the colliery.
- 14,577. But it is a fact on record that that company had to abandon the undertaking eventually?—Yes, they did abandon it.
- 14,578. And no one has ever worked it since?—No, no one has ever worked it since. It was possibly Mr. Coppe being a prisoner of war that led to its abandonment. Mr. Coppo was finding all the money, and there was no one at that time to find any money. He was a Belgian.
- 14,579. Did it ever occur to Lord Dunraven that the Company might have been helped if he had proposed to forgo his royalties for a certain time and let the colliery be worked?—They never asked for any concession in the royalty.
- 14,580. You have just admitted that they did?—I mean at the finish.
- 14,581. They never made an application for the removal of the royalties altogether, you mean?—No.
- 14,582. Do you know how much the Colliery Company was paying at the time when they had to abandon it?—I do not know at all.
- 14,583. In fact, you appear to know very little about it?—I do not know anything about the financial arrangements of the lessees or what profit they make.
- 14,584. All you are concerned about is whether you got your royalties or not, is it not?—That is all I have to look after.
- 14,585. You do not mind whether the Colliery Company lives or dies, or whether the workmen are thrown out of employment or not?—Does it matter whether I mind or not?
- 14,586. Perhaps as an agent it does not matter at all; but do you know that during the war 300 men were thrown out of employment because that colliery had to be abandoned, and they never got employment anywhere else for some time?—I do not know that.
- 14,587. *(To Lord Dunraven)*: Let us see if we can turn to something on which a little more knowledge could be obtained. You are also the Lord of the Manor, I believe?—Of what manor?
- 14,588. Of the Manor of Coity?—Yes.
- 14,589. You are aware that there is a large acreage of common land in that manor?—About 1,000 acres.
- 14,590. And that the whole of the minerals belong to yourself?—Yes.
- 14,591. Would you mind explaining to me how that 1,000 acres which is known as Bryncethin Common, which belongs presumably to the common people of Coity—how it came about that you became possessed of the minerals underneath that 1,000 acres, and upon which you draw a royalty? Can you explain how you acquired the right to the mineral property under the common lands of Bryncethin?—As Lord of the Manor—ancient manorial rights—I do not know what their origin is.
- 14,592. Have you ever inquired as to whether you have a title to the mineral rights of Bryncethin?—The same title that I have put in.
- 14,593. You have not put in a title, my Lord?—You mean I have not brought the title deeds here?
- 14,594. Have you any?—Yes.
- 14,595. To the mineral rights under the common?—I cannot tell you.
- 14,596. *(To Mr. Randall)*: Can you tell us?—I believe they are specially mentioned in the survey of the manor as belonging to the Lord of the Manor.
- 14,597. Have you ever examined them?—No.
- 14,598. Have they passed into your possession?—Have what passed into my possession?
- 14,599. Any title deeds belonging to his Lordship showing his title to the minerals under Bryncethin Common?—No.
- 14,600. *Mr. Herbert Smith*: May we have the title deeds for this common produced?—The title deeds can be produced.
- 14,601. *Chairman*: He will give us a *précis* of them. You have an abstract of them somewhere, I suppose?—Lord Dunraven's solicitors would have an abstract of the whole thing. I have not got it myself.
- 14,602. *Mr. Robert Smillie (To Lord Dunraven)*: The position is that there are 1,000 acres of common land under which the minerals have been worked. We want to know whether you have any right to work the minerals out from underneath the common land. We want to see your title to do so?—What are you referring to?
- 14,603. There are 1,000 acres of common land, and you work the minerals out from underneath that common land?—Which common land are you referring to?
- 14,604. *Mr. Frank Hodges*: All the common land in that neighbourhood. It is in the Manor of Coity.
- (Mr. Randall)*: They were certainly formed from part of what was purchased by Lord Dunraven's ancestor. That is referred to in the *précis* of his evidence.
- 14,605. You are not saying that from your own knowledge, because you have never seen the title?—That is so.
- 14,606. *Mr. Robert Smillie (To Lord Dunraven)*: It has been stated here by an eminent landowner this morning that under the common law of England the surface and the minerals always go together?—I believe so.
- 14,607. Lord Durham has said to-day that in some cases they are divided by agreement or arrangement, but under the common law they always go together. We want to know, if 1,000 acres of common land is really in the common ownership of all the people, why you work the minerals from underneath it and whether or not you have a title to do so?—*(Mr. Randall)*: The surface belongs to Lord Dunraven also.
- 14,608. It is common land?—No.
- Mr. Robert Smillie*: We shall see if you produce the title whether the surface or any part of the anywhere else for some time?—I do not know that.

(The Witnesses withdrew.)

7 May, 1919.]

MR. JOHN GEMMELL.

[Continued.]

Mr. JOHN GEMMELL, Sworn and Examined.

Chairman: This is a Scottish witness as to the nationalisation of mineral rights and methods of compensation: "Note of evidence proposed to be given by John Gemmell (64), mining engineer, 10, St. Andrew Square, Edinburgh, senior partner of the firm of Laudale, Frew & Gemmell, mining engineers, Edinburgh and Glasgow, and employed in or in connection with mines during the last 50 years."

14,609. I will ask Mr. McNair, the Secretary, to read the evidence.

Secretary:

"1. The Nationalisation of Mineral Rights is probably best approached by considering what would in practice require to be done in order to carry it into effect.

2. In the first place there must be a clear definition of the minerals that are to be taken over by the nation. Are all minerals and mineral substances of every description obtainable by underground working to be acquired, or only coal, ironstone, oil shale, limestone, ganister and freclay, or some or one of them?

3. In the next place, as land and minerals in this country are mostly held and owned together under the same title, the minerals taken over must be severed or dissociated from the surface of the ground and thereafter held under a separate title.

(a) The present proprietors could only dispose of the minerals subject to existing mineral leases. Their whole rights and interests in these, however, could be assigned to the nation except the rights to rents and compensation payable for surface lands occupied by the pits, railways, &c., of the existing mineral lessees, which would be retained by themselves as surface owners.

(b) The proprietors would, of course, reserve to themselves power to sell, feu, or lease the whole or any part or parts of the surface of their lands to the purchasers, feuars, or lessees of which the rents and compensation payable by the present mineral lessees, and after them by the nation, for land damaged or occupied or left unrestored, would pass.

(c) For mineral purposes it would be of the highest importance that the land of each surface proprietor should be burdened, on payment of compensation, with an easement or servitude for sinking pits, making railways, &c., occupying ground and letting down the surface, not only for working and carrying away the minerals within his own boundaries, as is usual, but also for working and carrying away all minerals belonging to the nation lying outside his boundaries.

4. The nation would in this way be in a position to work, or to give right to work, the minerals from any pit on any lands without reference to surface boundaries—the unlet minerals from the date of entry and the let minerals when the existing leases terminated, or sooner if the lessees' rights were acquired.

5. Although the obligation of an owner to give lateral support to his neighbour's land is thus got over on payment of compensation (3 (c)), there are lands, already severed from the minerals, which have a common law right of support (both subjacent and adjacent), so that minerals cannot be so worked as to damage or let down the surface, on pain of interdict or injunction. For the right to lower such land by complete excavation of the mineral (leaving no pillars) the surface owner often receives as compensation 1d. per ton of mineral worked under his property, in addition to having all injury caused by the mineral worker made good by him. The mineral worker usually also pays the compensation, but part of this is occasionally payable by the mineral owner. Where, therefore, such minerals are taken over, the part of the compensation payable by the mineral owner, and ultimately the whole compensation if and when the

lessee's interest is acquired, would be payable by the nation.

6. There still remains the case where the owner of severed lands having no right to subjacent support at all may invoke interdict or injunction to prohibit the working of the adjacent minerals in such manner as to injure his land or buildings. Railway companies, where they do not acquire subjacent support for their own protection within the prescribed distance of their works (usually 40 yards), although empowered to do so, now also claim the same right of common law support outside the prescribed distance.

7. I am of opinion that whatever may be said as to the Nationalisation of Mines, certain advantages should accrue from the Nationalisation of Minerals.

As the boundaries of the several properties need not be taken into account, coal left, or which would have been left, in boundary or other barriers may be worked; coal in several properties likely to be submerged and lost through the stoppage of pumping may be worked or placed in one hand for the purposes of working, drainage being effected at one or more central pumping stations; the working of marketable coal lying above or below any seam in course of extraction likely to be lost unless worked at the same time as such seam, may be arranged to be so worked or otherwise in such manner that it may be afterwards recovered; and the working of the more profitable seams may by arrangement be proportioned to the working of the less profitable to the end that undue profit may not be realised to the prejudice of the future.

8. But the Nationalisation of Minerals could only proceed slowly. The titles and encumbrances of each separate property would have to be examined, the consent of all interested parties obtained and new titles to the minerals prepared. As each title was completed the nation would enter into possession and deal with the minerals and existing mineral leases, drawing as lessors the mineral rents. As the taking over progressed and the existing leases expired it could either work the minerals itself or lease them for working, or work some of the collieries itself and let others for working, as might be considered advisable at the time. In any case, it need not nationalise mines situated on the minerals it had acquired, as these could be taken over at the termination of the leases under the terms thereof.

9. All this taking over of minerals and existing leases and the re-letting of minerals could only be properly done by a Department like the Office of Woods and Forests accustomed to such work.

10. The minerals could be transferred to a National Minerals Company, which would be an owning Company managing the business, and which would draw the rents of the existing lessees. It would also let on lease, for rents and royalties, any unlet minerals, and the minerals in existing leases as these came to an end, to District National Mining Companies, or working Companies, which would take over the plant and works of the outgoing tenants and carry on the collieries.

11. Both the owning Company and the working Companies could issue debentures and preference shares (the owning Company, as far as possible, to the proprietors from whom they purchase, and the working Companies, as far as possible, locally), the ordinary share capital being provided in each case by the Treasury, which would have a controlling interest and nominate directors, some of whom in the working Companies, would be miners or other colliery workmen or men who had been miners and had risen through all the stages to be managers—all to have at least 40 years' experience in mines.

12. Both the owning and working Companies would have to institute proper redemption funds for the re-instatement of their capital—in the case of the owning Company before the minerals are exhausted, and in the case of the working Companies before their leases terminate.

7 May, 1919.]

MR. JOHN GEMMELL.

[Continued.]

13. The method usually adopted in compensating the owners of minerals and mineral rights is to value the revenues derivable from these as annuities for their duration—"immediate" where the minerals are opened and being worked or, where not opened, "deferred" till the period of working begins—the purchaser being allowed a higher rate of interest on his purchase money for mining risk, commensurate with the risk, and over and above an additional sum which would if invested annually in a redemption fund, accumulating at a lower rate of interest, re-instate his purchase money by the time the minerals are exhausted and the annuity ends.

14. In Scotland, before the war, the risk interest I have allowed on revenues or annuities derived from minerals has been from 8 per cent. to as much as 12 per cent. to 15 per cent. where the seams were poor and badly disturbed—the redemption fund accumulating at 3 per cent. To obtain the nett revenue, the output available for royalty is taken at the average lordship rate likely to be realised during the working of the minerals, and all local taxes and mineral rights duty are deducted.

15. At 8 per cent. interest for mining risk and redeeming at 3 per cent., a nett revenue of £5,000 a year for 78 years is worth 12 years' purchase, making the compensation payable £60,000, but as a proprietor might not be able to re-invest this sum at the same risk so as to secure his original revenue, he could not be considered a willing seller.

16. I think the valuations should be settled by the valuator for the proprietor and the Inland Revenue Valuation Department, failing agreement, by a referee, with right of appeal against his decision to the Court."

14,610. *Mr. Robert Smillie*: Might we take it that you are in favour of State ownership of the mines?—No, I cannot say that particularly.

14,611. Are you an opponent of State ownership of the mines?—I am not an opponent. I say, by nationalisation you can get certain results, but you can get them otherwise.

14,612. You are neutral?—Yes, quite neutral.

14,613. You are neither friendly nor opposed to it? Is your opposition to the taking over of the minerals, as apart from taking over the mines, less than it is to taking over the mines?—Taking over the mines is a much more difficult operation. You must proceed to take over the minerals first. I only want to show how they are connected.

14,614. You have opened up a most interesting question here. You show us that there might be certain advantages accruing from nationalisation of minerals?—Yes.

14,615. Then you tabulate a number of advantages that might be derived?—Yes.

14,616. Then you go on to say in any case, supposing the State took over the minerals, they would not require to immediately nationalise the mines, because they would have the minerals, and as the leases ran out they could take over and run the mines?—The nation would be proprietors of the minerals subject to the leases.

14,617. As the leases ran out, they could take over the mines as they stood without compensation?—Yes, under the terms of the leases.

14,618. So that, really, to acquire the coal mines of Great Britain all that the nation has to do is to take over the minerals, either by purchase or conscript them, and then as the leases run out enter into possession?—Yes.

14,619. And nationalise the mines?—That would be competent under their title, but, of course, there are mines that are worked by the owners themselves; that would not apply to them.

14,620. You could hardly deal with them in that way?—No.

14,621. Your evidence is a most valuable contribution because we were afraid they were going to cost us too much.

14,622. I think that you probably have as wide experience as any mining man in Scotland. Have you known of any case where there has been coal lost irrecoverably which might have been saved if

there had been a common ownership of the minerals, or if they had been in the hands of one private person?—Yes, that might be said certainly if there had been State ownership all along.

14,623. Either State ownership or if one person had owned the whole thing?—That is the same thing for the purpose of working the coal.

14,624. You think there has been coal lost for that reason?—Yes, there is no doubt about it because small properties have been worked with customary barriers between them that would not have been lost.

14,625. Have you known cases of a small property where it would not pay to sink a pit because it was in the midst of other properties where the coal was taken out?—No, I cannot say that I know of any property lost.

14,626. You have known of properties in the centre of larger properties where the coal would have been lost unless the mine owner was prepared to pay a wayleave for getting his coal out?—Yes. Sometimes they agree that there should be no wayleaves. They grant free wayleaves and make the whole thing free.

14,627. Have you known a case where within a radius of three or four miles there were three or four pits sunk to exploit three different properties which might well have been exploited in one?—Yes, I have known a small property taking pits itself which might have been worked from another colliery altogether.

14,628. I put it to you that that is an enormous amount of waste?—Waste of capital no doubt.

14,629. If it were possible to work all the minerals from two or three properties in one shaft safely it is a waste of capital?—Yes, that is so.

14,630. I suppose it may be said to be a waste of labour because capital is labour?—I did not know that: labour gets paid always.

14,631. That is waste?—Certainly.

14,632. And it is the result of different ownership?—Yes, it has been caused by different ownership no doubt.

14,633. I think generally speaking now under leases granted by mineral owners the mine owner is held responsible for damage to the surface?—Yes, nearly always.

14,634. Nearly always the mine owner is responsible for surface damage?—The mine owner is responsible for surface damage.

14,635. In a great many cases the mineral owner who owns the surface leases the surface to people for building purposes?—Yes, that is so.

14,636. And for building houses as well as industrial works?—Yes.

14,637. In the case of houses is it a common thing that in the lease the mineral owner is not responsible for any damage which may be done to the property on the surface by extracting mineral from underneath?—The mineral owner himself is not responsible.

14,638. The owner of the mineral where he is owner of the surface grants a lease to a person to build a house or a dozen houses, but in the lease itself it is stipulated that he is entitled to extract the mineral from under the buildings without holding himself responsible for the wrecking of the building?—Without being liable for damage. I would not say wrecking the building. That is a bigger word.

14,639. Do you not know many cases in Lanarkshire where houses have been wrecked and torn to pieces within 15 years of their being built?—I could not say within 15 years, but I know of cases of houses being damaged. Of course, there are regulations now against that in some cases.

14,640. As a matter of fact, is the mine owner who has wrecked a building held responsible for the damage to the houses in any way?—If the mineral owner was responsible he would usually be.

14,641. The mineral owner keeps himself safe by putting a clause in?—Not always.

14,642. But generally speaking there is a clause by which you enable him to extract minerals from underneath the house?—That has been the case in

7 May, 1919.]

MR. JOHN GEMMELL.

[Continued.]

the past, but now leases are much better arranged. In some cases the landlord pays a certain portion of the damage. If he does that then the lessee must pay the remainder. That is the rule in some cases.

14,643. *Sir Adam Nimmo*: I think I am right in saying that there is no one who knows the Scottish coal-field better than you?—I know a good deal of it.

14,644. You have had a very long experience of it?—Yes.

14,645. You act for a very large number of mineral royalty owners, and you are also engaged in colliery operations yourself?—Yes.

14,646. So that you have an intimate knowledge upon all sides of the problem that is involved here?—That is so.

14,647. Is it your view that in the working of minerals in Scotland private enterprise has not been equal to all the development that has been required?—It has been quite equal.

14,648. Your view is that all the coal has been worked that has been required to be worked to meet the national necessity?—That is so. There is no doubt that there has been loss of coal in barriers.

14,649. I am coming to that. What I want to know is that it is your view that private enterprise has supplied the nation with all the coal that is required?—Yes—sometimes more than it needed.

14,650. Do you think that if the collieries had been brought under a national system you would have got any more coal?—You would get no more coal. I think.

14,651. That is to say, all the coal has been produced that could be used for the time being?—That is so.

14,652. I suppose you agree that there has been an enormous amount of energy and enterprise behind the individual efforts that have been put forward?—Yes, a very great deal in Scotland.

14,653. I think you agree that it has not been altogether profitable?—No, it has not been always profitable.

14,654. You have considerable detail knowledge, I believe, of the fact that there have been considerable sums of money lost in Scotland from the working of the collieries?—That is so. Some have never earned anything.

14,655. You know of cases where the collieries have had to be shut up?—Yes.

14,656. I notice that you deal specially with the question of barriers and loss of coal from other causes, and you seem to indicate that the nationalisation of minerals would get over these difficulties?—It should.

14,657. Would it not be possible to suggest some other method of getting over these difficulties?—You could easily get over the whole of them without nationalising them at all. You could set up a department for controlling any person who did not properly deal with his minerals.

14,658. If you could find some such method, would you prefer to maintain the principle of private ownership and private working?—I think so.

14,659. That is if you could find a satisfactory method?—I do not think there would be any difficulty in finding a method.

14,660. I am quite sure from your experience that an easy method would suggest itself without nationalising the minerals?—Yes.

14,661. Would it not be possible to set up some kind of central tribunal or a series of local tribunals to which application could be made for the release of coal that was being held up?—Yes; a central tribunal would be the best, so as to make it quite fair all over the country, with the same rules.

14,662. Making uniform judgments apply from one end of the country to the other?—Yes.

14,663. I take it that if such a central tribunal were set up it would desire to operate through local tribunals?—It would have to do so.

14,664. So as to get the benefit of all the local and expert knowledge it could?—Yes.

14,665. Would you approve of that principle being put into operation?—Yes; it would need to be put into operation unless something else were done.

14,666. Were you not a co-opted member of the Coal Conservation Committee?—Yes.

14,667. You adopted the principles that were adopted by that Committee for dealing with this class of property?—Yes.

14,668. You are aware that what was suggested there as being the supreme authority was a Minister of Mines?—Yes.

14,669. Are you particularly wrapped up in an appointment of a Minister of Mines so long as you can get the property dealt with in some other way?—You would get a good tribunal. I should prefer to have an official tribunal.

14,670. If you could get simple and direct application made to that tribunal?—Yes, an official referee.

14,671. Or some form of sanctioning authority which would have enough power to dispose of these questions?—Yes.

14,672. If I suggested to you that the sanctioning authority that might be best for the purpose would be a sanctioning authority which would be composed of Members of Parliament, what would you say to that form of sanctioning authority, which would be in effect a miniature Parliament?—I am not very much in love with Members of Parliament.

14,673. Would it not secure a thoroughly unbiassed view, as far as it is possible to get it?—I think if you have lawyers and engineers you would get the best tribunal.

14,674. What we want to get at is the setting up of a thoroughly representative and impartial tribunal?—That is so.

14,675. If you secured that, you would be satisfied that this class of problem would be satisfactorily disposed of?—If you can set up any sort of tribunal or Minister which would take into its possession any minerals that are not being properly wrought.

14,676. *Mr. R. H. Tawney*: Take it over, you mean?—No, take it into possession for the purpose of working if anyone refused to let his minerals, or to let minerals that were underneath other people's surface. You can conceive that it could be taken into possession for the purpose of working and actually letting it.

14,677. *Sir Adam Nimmo*: Was it not a feature of the Report by the Coal Conservation Committee that there should be a Mining Advisory Council which would be associated with the Minister of Mines or with the Home Office?—Yes, that is so.

14,678. Would you regard it as very desirable that such a Council should be established?—You must have a Council.

14,679. So as to be able to supply the necessary expert advice and knowledge in order to deal with the problems?—That is so. Everybody should be represented on these things.

14,680. I take it that this Mining Council would be in a position to make application where it was considered necessary to the Central Tribunal?—Yes.

14,681. And would supply the Central Tribunal with such information as was at its disposal?—Yes.

14,682. Upon that information the sanctioning tribunal would give its decision?—Yes.

14,683. Provided the powers that were vested in the sanctioning authority were sufficiently wide, do you see any difficulty in dealing with all this class of problem that is being put before this Commission—that is to say, the setting free of coal in the national interest wherever it was being held up?—No.

14,684. Would you go as far as to say that if coal is being improperly worked, contrary to the national interest, that the Mining Board should be able to take action in cases like that?—That would be quite proper.

14,685. So as ultimately to secure that no coal was lost in the national interest?—That is the real object.

14,686. Would you not prefer that system to what is proposed in the nationalisation of mines?—I would not propose nationalisation of all minerals for that alone.

14,687. If that form of machinery were set up in your view does that get you sufficiently far to deal with all this class of property?—Yes, quite far enough.

14,688. You say that with all the knowledge and experience of a long life-time behind you?—Yes.

14,689. Dealing with the problem both from the position of the mineral royalty owner and from the position of the experienced mining engineer handling the collieries in detail?—Yes, that is so.

7 May, 1919.]

MR. JOHN GEMMELL.

[Continued.]

14,690. May I ask you with regard to the present practice as far as colliery undertakings are concerned, in dealing with the working of minerals is it not the case that coal generally speaking is exhausted by a mineral lessee before he leaves his coalfield?—Not always.

14,691. I take it that it is exhausted in so far as it can profitably be exhausted at the time?—I thought you were referring to mineral leases.

14,692. I am referring to cases where I take it it is suggested that sometimes the best part of a coalfield is worked out and the worst coals are left?—Yes.

14,693. As a matter of detailed practice in the handling of collieries is that the case?—Not nowadays.

14,694. As a matter of fact, is it not the case that before a lessee finishes his leasehold he has exhausted every ton of workable coal at the time?—That is right enough, but you must not talk about his leasehold, because it may be a 30 years' lease. His lease is continued, and continued in a general way.

14,695. I was assuming that there would be a continuity of tenure, because I take it that, generally speaking, there is no difficulty with a lessor only having a lease extended if a colliery lessee has worked it for a considerable period?—If he has worked it fairly there is no difficulty in getting it extended.

14,696. In the terms of the leases themselves I suppose every practical provision is made for the exhaustion of the coal?—Yes.

14,697. That is to say, that you put in conditions that protect the proprietor against loss or waste of coal as much as possible?—Yes, sometimes make them pay for it if they leave it.

14,698. I was asking if provision was not usually made in leases so as to secure there was no waste of coal or as little waste as is practicable?—That is so, and sometimes it is so stringent that they actually pay for the coal if they leave it.

14,699. That is to say, that the proprietor may take the alternative of charging on the tonnage put out or base it on measurement?—Yes.

14,700. So that the tenant has always a certain amount of compulsion behind him to make him work all the coal he can?—Sometimes if he is a poor worker he has that put on him.

14,701. Is it not a matter of general experience with the lessee that even if he starts with the thick coal in his leasehold so as to get a thoroughly good foothold in connection with his operations before he has finished he traverses every workable seam there is, and generally speaking he exhausts the coal before he gives up the lease?—He takes out everything he can work at a profit. I have no objection to a tenant or lessee making money if he spends it on the coalfield.

14,702. With regard to the question of valuation I take it that your view is that there would need to be a detailed valuation in each case?—Yes, that is the only fair way. You could not make an overhead valuation because some would be too big and some too small.

14,703. You cannot deal with the valuation on the average in a matter of this kind?—No.

14,704. You cannot base it on so many years' purchase?—No.

14,705. You have to come up against the facts bearing on each individual case?—Yes.

14,706. You suggest a form of machinery for carrying out valuations, but I take it you are not tied to that particular kind of machinery?—No, that is the form that is in existence at present.

14,707. That is to say, that what you are making for at present is that there should be an entirely fair valuation by a competent tribunal in the light of all the facts?—Yes, you must have a competent tribunal to deal with every case on its own merits.

14,708. *Mr. R. W. Cooper*: When you come here are you speaking for Scotland only?—Yes; I do not know much about England.

14,709. With regard to your leases in Scotland, what is the longest lease which you grant to a lessee in Scotland?—The longest leases are 40 to 60 years, but they have been granted up to 99 years and I think 999 years.

14,710. Did I understand you suggested as a workable proposition that the Crown should take over what you call the lordship interest or royalty interest and then should wait until the end of the 999 years before they took possession of the working interest?—999 years would be practically a permanency.

14,711. Then let me take 60 years?—Yes. A great lot of the minerals would fall in in 20 or 30 years.

14,712. Let me take the case of a lease with a short term. Is there no such thing in Scotland as in England of the expectation of a renewal of the lease?—They often apply for a new lease six or seven years before the old one has run out.

14,713. Do you therefore seriously suggest that in the case of these short leases the State should buy up the reversion and then calmly wait for the expiration of the lease and turn out the lessee when desired?—No, I do not say that at all. I think that is what they are entitled to do under the leases.

14,714. Do you suggest that is a reasonable proposition?—No, I do not say that is a reasonable proposition.

14,715. Why do you suggest it at all?—I said that that is something they could do.

14,716. You can commit highway robbery if you like?—But it is not robbery.

14,717. *Mr. R. H. Tawney (To the Witness)*: Did you not mean that it is at any rate a legal proposition?—It is something you are entitled to do.

14,718. *Mr. R. W. Cooper*: In Scotland do landlords ever do that?—Oh, yes, they sometimes take over another colliery.

14,719. Have you acted for the landlord who has turned out a lessee?—Yes.

14,720. Was there any reason for that?—No, except he wished to work it himself.

14,721. What did he pay the lessee by way of compensation?—He paid him what he was entitled to under his lease.

14,722. What was that?—He was entitled to the going value of his machinery and plant.

14,723. Beyond the plant and the machinery, this lessor simply took possession and deprived the lessee of his property?—No, he had no property in it.

14,724. Legally he had not, I know?—He took possession of the shafts and mines.

14,725. Apparently, in Scotland you attach no value to what I may call the equitable expectation?—No, I do not think we do attach much.

14,726. *Mr. Evan Williams*: You suggest there are certain benefits that would accrue from the nationalisation of the minerals?—Yes.

14,727. Then you propose, after acquiring the minerals, that the Crown should allow the leases to lapse before entering into possession?—Yes, that is what it could do.

14,728. In the meantime, I suppose, all the rights of the lessee under the lease would continue?—Yes.

14,729. There would be no more right of interference on the part of the Crown than there is at present on the part of the lessor?—That is perfectly clear.

14,730. So that the first serious result of the buying of the minerals would be that the mine itself would become the property of the Crown?—Yes.

14,731. I understand from you that you are not in favour of the nationalisation of mines?—No, I am not.

14,732. So that the first result is something which you yourself consider undesirable?—Yes.

14,733. That being so, do you still think that a nationalisation of minerals upon the lines which you suggest is the proper thing?—No; I say that the same advantages could be secured otherwise.

14,734. Can anything accrue until the expiration of the present leases under your scheme except what you consider undesirable, namely, the ownership of the mine by the State?—The ownership of the mine would be simply transferred to the State which could lease or work any unlet minerals.

14,735. So that the result of your scheme is something which you consider undesirable?—Yes. It is not a scheme, exactly. I am only pointing out that the proper way to approach the problem is to see what it leads to in practice.

7 May, 1919.]

MR. JOHN GEMMELL.

[Continued.]

14,736. It is a *reductio ad absurdum*?—I do not think it is a *reductio ad absurdum*. It is a real consideration of what it leads to in practice and what it will lead to.

14,737. You want to point out that nationalisation of minerals under this scheme leads to something which is very undesirable?—Yes. It cannot be done immediately, it can only be done very slowly, and you must be in a position to stop at any time.

14,738. *Sir Leo Chiozza Money*: Sir Adam Nimmo mentioned to you a proposal to form a Government Mining Department to remedy the evils which you point out in your *précis*?—Yes.

14,739. Are you aware that in the Report signed by Sir Adam Nimmo in which this is recommended to His Majesty's Government the duties of this Mining Department are described under no less than 16 headings?—Yes.

14,740. Have you seen the Report? (*Handing Report to Witness*).—No, I was not a member of that committee.

14,741. Perhaps you are not aware that the duties of this Mining Department are described under no less than 16 headings in this report. This is on page 5 under section "d" of the description of duties: "Before fresh mines are opened up such information"—that is general information—"should be furnished to the Mining Department as will enable it to consider the proposed area boundaries and general method of development in relation to other works existing or proposed in the same mineral field, and thus obviate the risk of production as a whole being impaired by initial mistakes." Do you think that that can be done without very diligent work on the part of the Mining Department?—Yes.

14,742. Would it not mean a Department of very considerable size if such duties as that were put upon it?—I do not know that the size would be very great. You would want very competent men.

14,743. I put it if this Mining Department is to see no mistakes are made in the mining industry of this country would it not require a very large staff indeed?—It would require a commensurate staff of course.

14,744. Do you think the present small inspectorate which cannot even inspect one mine a year could deal with such duties?—That department could not deal with it.

14,745. Would it mean the erection of a Department by the Home Office of very different size?—It would be a different class of persons altogether, considering questions not of safety but of actual working.

14,746. It would need its inspectors to see that these things were so?—Yes. I do not know what the report all means because I have not read it.

14,747. Are you aware the duties are put upon it of seeing that there is an adequate survey of the coal of this country and do you not think that that is a very serious thing?—What does that mean?

14,748. A survey of the whole of the coal of the country with a view to finding sufficient coal if it exists and for exploring untested fields and so on?—A great deal of that has been done already.

14,749. Do you agree with the conclusion of this committee that not enough has been done?—I do not think enough has been done.

14,750. Do you agree with the eminent geologists who think a great deal more ought to be done, and on a national scale?—Yes, I think a great deal more might be done, and done satisfactorily.

14,751. I put it that if such duties were put upon the Mining Department as are suggested by Sir Adam Nimmo it would have to be a department of very considerable size?—Yes. I think, however, Sir Adam Nimmo was not putting to me this Department, but a Mining Ministry suggested by a Reconstruction Committee of which I was a member, which is another thing altogether.

14,752. Will you take it that these things are so described in this report and will you agree that at any rate it would have to be a Department undertaking, as is forecasted, very great duties and responsibilities and would have to be adequately staffed?—Yes, it would have to be adequately staffed.

14,753. Do you think it would be an advantage to superimpose upon this present mining industry as it now exists an army of officials to see that the coal of this country is properly worked and that the lessors behave properly to the lessees?—I would not suggest that a great army should be put upon it, but, for the purpose of saving the coal, as I suggested in my evidence, it requires a very small staff.

14,754. But I have suggested to you that this Mining Department which is suggested as an alternative to nationalisation would really demand a very large number of officials?—Well, I should like to read the Report before I say what it means.

14,755. I rather thought, as a man of business, you had not considered the whole of the proposal which was being put to you by Sir Adam Nimmo before you consented to his proposals?—Yes. I did not understand he was putting that report, but another report of the Reconstruction Committee in which certain suggestions were made.

14,756. If we had such a Mining Department, and if, at great expense, it explored the coalfields of this country, known and unknown, and discovered fresh coalfields, and was able to show that some coal could be worked and that led to more coal being worked, do you think it right and proper that the State should spend money on that in order to put more royalties into the pockets of the landlords of the country?—No, I do not think the State should spend money on putting money into other people's pockets.

14,757. Would you describe it as the very reverse of a business proposition?—Yes. The landlords themselves, of course, do a great deal of boring.

14,758. I am aware of that. May I put another proposition to you? The royalties in this country at the present time amount to about £6,000,000 a year, or something like that, with reduced output. I do not know exactly what it is. But, even if the output is not increased, that will mean in the course of the next century a payment of £600,000,000 to the landlords of this country for royalties?—Yes.

14,759. Merely as a matter of business would it not be a good thing to extinguish that perpetual payment even at the cost of reasonable compensation?—No, I think that would be a mistake.

14,760. On what business ground do you base that, seeing that this country will probably last for more than a hundred years?—Even supposing you carried out nationalisation completely, you would have to keep the royalties apart for taxation and other purposes.

14,761. I am thinking of the recipients of the royalties. We have a separate class of men doing no service to the State except letting us work coal, and who are receiving this £6,000,000 a year. From a business point of view, would it not be well to extinguish that system in order to prevent this perpetual payment?—But you would have to pay them to begin with.

14,762. Of course, but the State has the advantage of superior credit and it could establish a sinking fund. Would that not wipe out the burden in a small number of years?—You would have to redeem the whole of the capital which you spent on it yourselves.

14,763. And that could be done by a sinking fund and in less than one century, could it not?—You would have to pay more into the sinking fund.

14,764. But at the same time is it not obvious that even if you paid compensation, and good compensation, that would be a better business proposition for the nation, seeing that it lives longer than the royalty owners, rather than that the nation should go on paying successive generations of royalty owners?—I do not see that you make much advantage of it.

14,765. May I put it to you that even on Professor Sir William Ramsay's estimate the coal of this country would be exhausted in 175 years—and some say more—it is not good for this country to go on paying £6,000,000 a year during that period?—Not if you can avoid it.

14,766. Cannot it be avoided by nationalisation?—No, you simply capitalise the money value of the royalties.

14,767. But if you provide a proper sinking fund, does not that extinguish the whole duty within a reasonable period?—But you must find the money

7 May, 1919.]

MR. JOHN GEMMELL.

[Continued.]

14,768. Yes, but is not the State in a better position with regard to credit than the present possessors of royalties, and cannot it therefore extinguish those royalties in such a way as to make a good business transaction for itself, looking at it merely from the business point of view?—I do not see how you make a saving on it.

Mr. Herbert Smith: When Sir Adam Nimmo put a question to you, do you not think you answered it before you realised what you were being asked? He asked you if the nationalisation theory of mines was not put in as a kind of pad.

Sir Adam Nimmo: That was a question I put to the previous witness.

Mr. Herbert Smith: Then I will leave it.

14,769. I think you signed this report of the Coal Commission Committee of 1918?—Yes.

14,770. Was there not a Minority Report there?—Yes, I think there was.

14,771. By Mr. Smillie?—Yes, I think so.

14,772. As a matter of fact there were two Minority Reports?—Yes. I thought each man was going to have a report of his own.

14,773. In the first instance, there were eleven who signed the Report. Then there was a Minority Report signed by three—Sir Adam Nimmo was one of the three—and there is a further Minority Report signed by one?—Who is the one?

14,774. Mr. Smillie. Do you remember that?—Yes.

14,775. So that they did not agree altogether. One of the things you enquired into was the amount of coal lost by barriers?—Yes.

14,776. And you put that down at a figure of 9,500,000 tons?—That is taken out of some other report.

14,777. But that is in the Report?—No, that is taken out of some other report.

14,778. But it is embodied in this report?—Yes.

14,779. You appear in the report and you deal with it?—Yes. It was taken out of the Coal Supply Report.

14,780. So that what Sir Adam Nimmo wants to impress upon you is that it is not only a loss to the colliery owner, but a loss to the nation?—Yes. Any coal not brought to the surface must be a national loss.

14,781. In that report you also deal with the flooding of mines in South Staffordshire?—Yes.

14,782. And this would be a waste unless a policy were adopted to get the water out?—Yes.

14,783. Is it expected that the nation ought to get the water out, ought not the nation to get the coal? Surely it ought not to be expected that the nation should pump the water out for other people to get the coal?—What I suggested was that the coal should be taken into possession by this Ministry of Mines which was proposed: that they should take it into possession themselves for the purpose of putting it into one hand, and one hand would do the whole work.

14,784. So that, as I understand, you are in favour of nationalisation there?—Yes, so far as that was concerned, if you call that nationalisation.

14,785. If the country attempted to get the water out so as to get the coal, the country would nationalise it?—Yes, if they could not agree themselves to recover the coalfield. The suggestion was that the Ministry of Mines, or whatever the Department was, should take the whole of this coal into possession and lease it to some company capable of doing the whole work.

14,786. Seeing they have already failed to agree, and South Staffordshire has been flooded by someone's neglect, does not that prove that they cannot agree and that it ought to be nationalised?—Whether you call it nationalisation or specialisation, it is the same thing so far as I am concerned. You do not need to nationalise all the mines in the country for the purpose of saving some small thing in South Staffordshire or Scotland.

14,787. No, but am I right in saying that the coal in the South Staffordshire coalfield ought not to have been wasted as it has been through flooding by water?—Of course, the first thing is to ascertain whether it could be worked at a profit at all.

14,788. That has been already proved, and they have worked largely profitable coal. Do you suggest now we should start and take that which is not profitable?—If you are satisfied the whole coal can be worked and the water pumped out. What we suggested was in that case it should form one field and be taken in charge by the Ministry of Mines.

14,798. Do I understand the point you make now is that unless it will pay plus a profit we ought to lose it for all time?—No, not for all time, because it might become profitable in later times.

14,790. Is it your policy to work out all the best by private enterprise, and then when it is worked out work the rest by the State?—No.

14,791. Will you tell us what you mean? You either mean one thing or the other?—What I mean is you can do it either by nationalisation or do it separately.

14,792. By nationalisation. They failed to do it in Staffordshire under private enterprise?—Taking this as a separate thing altogether and apart from nationalisation, it is a small unit.

14,793. Now turning to your paper, I am rather interested in this paper. Why should these men who have to serve have 40 years' experience? Should that not apply to colliery owners as well as men selected for the boards?—What I thought in connection with mines is that mining is an art. You are far better off with men of long experience. I say it applies to all people connected with mines—to mining engineers, miners and everyone.

14,794. And to directors too?—Yes. If you do not have men of long experience.

14,795. There would be a lot of people out of work now?—Yes, there might be, but that is my view of the general position.

14,796. You do know plenty of directors who have practically never been seen at the pit head?—Oh yes, but they have other qualifications of course. I always understood what you wanted was that some people should be represented upon these boards with regard to the direction of the mine. That is the only way in which you can direct a mine. You cannot very well interfere with the manager himself. The directors even cannot do that.

14,797. If I should have 40 years' experience as a workman's representative, should not the director have 40 years' experience equally?—No, I do not think so.

14,798. What would be his special qualification—that he has money, and I have not?—He will be a financial man.

14,799. I may have a brain and he may have money, but I am not qualified?—That is not the point; it is qualification by experience.

14,800. I want to put it to you that if I have to have 40 years' experience before I come to the board, he ought to have 40 years' experience?—I do not attach so much to your age as to the fact that you are a really experienced man. I do not think a young fellow coming on as a workman to a board would be very much help.

14,801. Of course directors make recommendations to be done, and managers have sometimes to talk to directors who know nothing about their pits and who tell the manager what to do?—No, they cannot interfere in the technical management of the mine.

14,802. Do not tell me that. I have stood at the door watching?—No. Sir Richard Redmayne will tell you that.

14,803. I have not had the pleasure of being on the directorate, but I have stood at the door and watched them. Do you not know financiers come down, and if the manager wants to put down any scheme of working he has to put it to the directors for approval?—We do not do that in Scotland.

7 May, 1919.]

MR. JOHN GEMMELL.

[Continued.]

14,804. You are an exception?—It may be.

14,805. But you know it happens with scores of financiers who came and put money in coal mines

before a manager can move?—It may happen in England, but I have no experience of that in Scotland.

(The Witness withdrew.)

MR. JOHN TRYON, Sworn and Examined.

14,806. *Chairman*: Are you a trustee of the Earl of Dudley's Settled Estates, a director of the Earl of Dudley's Baggeridge Colliery, Ltd., and a director of the Earl of Dudley's Round Oak Works, Ltd.?—Yes.

14,807. Will you kindly read your proof?—Yes. I shall ask your leave to add one or two passages at the end because of what I have heard since I have been here.

14,808. Certainly?—"The Earl of Dudley is, like several other peers, both a lessor of mines at royalties and also a large colliery proprietor. His estates of about 12,000 acres lie in South Staffordshire and East Worcestershire. The estates have been held by the family for many centuries, and coal and iron were worked on them in the early part of the 17th century. In the year 1620 the then Earl of Dudley procured from King James a patent for an invention by his son for smelting iron ore with fuel made from coal, and furnaces were erected on the estate. Smelting had previously been carried on by charcoal as fuel. In the year 1690 mineral property in the district was valued at £150 an acre, and the price of coal was 2s. 4d. a ton, while in 1790 it averaged 4s. 6d. a ton. In 1817 about 2,000 persons were employed in the district, and steam gins for winding had supplanted horse gins, and the weekly output was about 46,000 tons over the district. Before 1874 there were 200 shafts at work on the estate producing one and a half million tons of coal a year, with 50 miles of private railways connecting the collieries and works on the estate with the Great Western Railway and canals. The total output of the district was then about 10,500,000 tons yearly.

"I and my predecessors in business as solicitors have acted as solicitors in connection with the estate for over 100 years.

"At the present time the owner carries on the following businesses: Colliery proprietor (one colliery known as Baggeridge Colliery of about 3,500 acres being leased to the Earl of Dudley's Baggeridge Colliery Limited, Lord Dudley being practically the sole shareholder). Blast furnace proprietor. Foundries for casting iron and aluminium. Engineering works chiefly in connection with construction of locomotives, railway wagons, and other plant required on the estate. Brick works, limestone works, and as practically sole shareholder in the Earl of Dudley's Round Oak Works, Limited, the manufacture of joists, steel sections, iron bars, chain, chain cable, etc., and during the War shell steel, with the private railways and a private canal connecting collieries and his and other works with the Great Western Railway and Canal Basins. The old coalfield was worked for about 200 years, and the mines were shallow, and at the end of the last century had to a great extent been worked out, and with the view of ascertaining whether coal existed on the Western side of the Western Boundary Fault, which had then always been considered the Western boundary of the coalfield, his Lordship bored for coal. Notwithstanding that the borings to a depth of 1,600 feet showed different results and were not entirely satisfactory, a shaft was sunk to a depth of about 550 yards, and a seam of good coal 22 feet thick was found with a seam of excellent coal about three feet thick above it, and below the thick seam a valuable seam of ironstone, and doubtless there are lower measures. Since the colliery has been developed at a total cost of over £400,000."

14,809. Is that seam called the 10-Yard Seam?—It is the same seam, only it is not so thick. Probably it is to a certain extent compressed with weight.

"Having regard to the depth of the coal, the thickness of the seam, and the great superincumbent

weight, all the roads from the pit bottom were driven in the rock under the coal and arched with brickwork for a distance of 400 yards from the pit bottom. This involved great cost, but was in the nature of insurance premium against spontaneous fires which might injure the shafts. The pit bottom is entirely encased with brickwork like a part of the Tubo railways, only of very much greater dimensions. Moreover, owing to the fact that in thick coal-mining the roads must be driven to the boundary of the colliery and the workings are from the circumference towards the shafts, great initial expenditure in roads was needed far beyond what is necessary in thin coal-mining.

"Up to the present time the whole of the profits (including Royalties) of the colliery have been expended in developments.

"In order to provide the £400,000, Lord Dudley pledged his personal credit for £200,000, besides finding other £200,000. In doing this his Lordship followed on in the course of his predecessors in developing trade and industry in his estates and giving large employment to labour.

"If, instead of expending this large amount of capital, Lord Dudley had given the unopened mines to the colliers in the district, they could have done nothing with them, and they would have remained unopened so far as their ability is concerned. Now that he has expended his capital and developed the colliery successfully, the miners who have the benefit of employment in it seem anxious to deprive him of the whole or part of the fruit of his enterprise before he has derived any profit. This, if so, to put it mildly, indicates a disregard of elementary justice.

"His Lordship also still works collieries on the old estate himself, and lets others to lessees. The terms of the leases are, in my belief, fair and reasonable, but it has been the invariable practice during the forty years during which I have been connected with the estates, and as to which I can speak from my own knowledge, for the mining agent for the time being to treat lessees fairly, entirely regardless of the strict rights of the lessor. For example, during the minority of the present owner, it was discovered that by reason of water in an adjacent colliery it would be dangerous to work a colliery then recently let to a lessee who had become liable for a large sum for minimum royalties while he was developing the pit, and on the recommendation of the then agent application was made by the Earl's guardians to the court to authorise the forgiveness of the debt, which application was granted—and all liability under the lease was cancelled.

"The coal under the old area consisted of the following seams:—Brooch coal from 3 to 4 feet thick. Thick coal from about 18 to 34 feet thick. Heathen coal and Gubbing ironstone from 5 to 7 feet. New mine coal from 6 to 10 feet. Bottom coal in places about 10 feet. The seams were generally at a depth of from 100 to 200 yards, and some coal has been worked by open workings from the surface. Owing to numerous faults and dislocations, and the shallowness of the mines, there are great numbers of pits from which small areas are worked as being the most economical method. The thick coal is worked by successive workings on the rib and pillar system, ribs and pillars being left for support of the roof, and these are got in second, third, and sometimes fourth workings after due intervals have elapsed.

"Value of Royalties and Wayleaves.—In olden days royalties were very much higher than now—e.g., I have in my possession a lease granted in 1835 where the royalty amounted to over 2s. a ton, and in 1842 the accounts show royalties of 1s. 7d. a ton. At the present time the royalties work out at less than 4d.

7 May, 1919.]

MR. JOHN TRYON.

[Continued.]

a ton, or about 2 per cent. of the value of the product to-day. They are as regards thick coal based on the area of the coal leased (usually a few acres) at the rate of a fixed sum per acre, the price varying with the thickness of the seam and in the case of ribs and pillars the estimated quantity of coal left unworked to be gotten—and the minimum rent is the estimated total royalty on the coal that can be gotten in the area divided by the number of years for which the lease is granted, after payment of which liability under the lease terminates. The usual basis of royalties is not on the sliding scale, though in the case of the Baggoridge Colliery the Court directed for the protection of the successor that a large royalty should be paid on a sliding scale basis to cover interest on £99,000 settled capital money expended on developments, but the owner being entitled to both royalties and dividends during his life this arrangement was not prejudicial to any one. All leases provide for shorts.

"Practically the entire output of the district is consumed within a 20 mile radius."

14,810. What is the station for Baggoridge?—We have a private railway which comes down into Dudley and goes to Ashwood Basin on the Staffordshire and Worcestershire Canal. That deals with the Kidderminster traffic, and a good deal of our coal goes by the Birmingham Canal to wharves on the Birmingham Canal for the Birmingham trade, such as the Electric Light Works, and Chances, and all that class of people.

"During the course of my practice I, on behalf of another owner, prepared leases of collieries in Warwickshire and have also advised lessees on taking leases of collieries in the Midlands. The payment of royalties on a sliding scale is in my experience exceptional, and then for good reason. In one case the late Mr. C. N. Newdegate, M.P., had himself opened a colliery at his own expense. He afterwards let it with the plant at a nominal rent of £1 a year for the plant and shafts and reserved a royalty of 1/20th of selling value to cover not only the value of the coal but also interest and sinking fund on his expenditure. It has been a successful concern. Another landowner spent nearly £250,000 in acquisition and development of a large mineral area and sold the colliery for about £200,000, taking a large part of the purchase money in debentures which he still holds, getting the remaining £50,000 out of a royalty of 4d. a ton. This effort greatly increased the trade and prosperity of the neighbouring town of Nuneaton. The net benefit which an owner derived last year through increased royalties on a sliding scale on the basis of an excess of £1,000 is £93. These are only illustrations of the effect of private enterprise.

"In a case where a lessor has expended capital to be repaid by increased royalties the sliding scale is desirable because in times of bad trade and low prices the lessee is not encumbered with a high royalty, while in times of good trade and high prices the higher royalty can be paid without inconvenience.

"In my experience a charge for underground wayleaves is comparatively rare. The Warwickshire Coal Company acquired the mining rights over a large area belonging to many owners, some of whom I advised as to the terms of the leases. No charge was made for any wayleaves through the coal of the various owners. On the other hand, in cases where shafts have been let to a lessee to enable him to get coal not belonging to the owners of the shafts

rent has been charged for their use by way of interest on their cost. I am fully in accord with the principle of leaving it to a Statutory Authority to settle what are fair terms for wayleaves whether the subject of existing contracts or not—and also any other matters such as the grant of wayleaves, the right to a grant of a lease to work mines (especially those necessary to enable adjacent mines to be gotten when the owner does not require them himself for the purpose of working them) which will contribute to the national welfare.

"In my opinion the absolute right of the owner of the surface to support where the ownership of the surface and the right to work the minerals have been severed has been carried too far. In the national interest the relative values of the surface and minerals ought to be considered, and it is not in my opinion reasonable that minerals of the value when raised of perhaps £10,000 an acre, of which a very large part goes to labour and which are essential to the trade of the country, should be bound by injunction to be left ungotten because of the possible damage which may not amount to more than a trifling sum to the surface and buildings.

"I am opposed to the compulsory acquisition of mines as a whole by the State—though if in the case of any individual mine it was required for the public benefit it is conceded that the public interest must prevail."

14,811. Is it your view that a sliding scale royalty is only justifiable where the lessor has expended capital?—I do not go so far as that, but I say it is a peculiarly useful thing. My experience is that sliding scales are not common, though I can perfectly understand a lessee asking for it, if he gets a low proportion, because it will average itself out, and it is easy for him to pay a low royalty when trade is bad, and a higher royalty when trade is good. It is merely a choice of the lessee as to what suits him best. I do not think there is anything immoral in a sliding scale, and I do not want to suggest that, but in my experience it does not often happen. It is the only case I know of.

14,812. You say: "I am opposed to the compulsory acquisition of mines as a whole by the State—though if in the case of any individual mine it was required for the public benefit, it is considered that public interest must prevail." What cases had you in mind?—I am only stating that in the same way that I should be opposed to nationalisation of land. If land is wanted for the purpose of a Railway, it is perfectly necessary. Supposing the Government were to say they were going to work Admiralty coal and to exclude other people from a particular form of coal, then I should say the national interest must prevail. That is what was in my mind. If there was any special reason for wanting for any special purpose any particular colliery, the State ought to have an absolute control of the industry in respect of that particular thing, as in a particular place like Cardiff, for instance. That is all that is in my mind.

"Reasons against Nationalisation.—I base my objections on the following grounds:—

1. That minerals (except royal minerals) have always been recognised as private property and as such have been the basis of legal transactions between Vendor and Purchase, Lessor and Lessee, Mortgagor and Mortgagee, and the financial security of the community is based on the sanctity of private ownership."

(Adjourned to to-morrow morning, at 10.30.)

8 May, 1919.]

MR. TIMOTHY WARREN.

[Continued.]

SECOND STAGE—NINTH DAY.

THURSDAY, 8TH MAY, 1919.

PRESENT :

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. ROBERT SMILLIE.

MR. R. W. COOPER.

SIR ALLAN M. SMITH.

SIR ARTHUR DUCKHAM.

MR. HERBERT SMITH.

MR. FRANK HODGES.

MR. R. H. TAWNEY.

SIR LEO CHIOZZA MONEY.

MR. SIDNEY WEBB.

SIR ADAM NIMMO.

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE (*Assessor*).MR. ARNOLD D. McNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

Sir Leo Chiozza Money: May I have permission to make an application?

Chairman: Certainly.

Sir Leo Chiozza Money: A Committee appointed by the Reconstruction Ministry has presented a very valuable report with regard to trusts and combinations, and I ask that copies of that may be circulated.

Chairman: Yes, I will do what I can with regard to that.

Mr. R. W. Cooper: Sir, may I, with your permission, make a request to the Press on behalf of

Lord Durham to correct a statement in their report of yesterday's proceedings? In answer to a question by Mr. Smillie addressed to Colonel Stobart the answer as it appears in the "Times" and the "Evening Standard" and probably other papers was that Lord Durham's surface rents amounted to about £10,000 a year. The answer really was that certain rents amounting to dead or minimum mining rents were about £10,000 a year. The answer had nothing to do with Lord Durham's land or surface rents.

Chairman: Thank you.

MR. TIMOTHY WARREN, Sworn and Examined.

14,813. *Chairman*: Are you a solicitor in Glasgow and a partner of the firm of Moncrieff, Warren, Paterson & Co., Solicitors, there?—Yes.

14,814. Do you act as Law Agent for the Duke of Hamilton in relation to any Scotch real property he possesses?—Yes.

14,815. You say in your proof that that consists of the two properties, Pardovan and Riecarton, in the county of Linlithgow, extending together to about 1,450 acres. In neither of these is coal found. It is possible there may be some oil shale, but it has only been worked in Pardovan, though unsuccessfully, on account of the poor quality?—Yes.

14,816. Do you also act as Law Agent for the Hamilton Estate Trustees, a body constituted by the Hamilton Estate Act, 1918?—Yes.

14,817. *Chairman*: Those are Mr. Warren's qualifications, and I will now ask the Secretary to read his proof.

The Secretary:

"That Act was passed for the purpose of dividing the administration of the last Duke of Hamilton's Trust into two separate sections—the one relating to the Island of Arrau, and the other properties in which the late Duke's only child the Marchioness of Graham and her children are interested, and the other (the Hamilton Estates Trust) relating to the properties, chiefly real properties in Lanarkshire,

Stirlingshire, and Linlithgowshire, in which the present Duke and his children are interested.

I assume that the request for information which has been addressed to the Duke, relates to the lands held by the Hamilton Estate Trustees.

Under the Act of Parliament, special provision is made that both bodies of Trustees are to continue to administer the estate respectively coming under their control under the Act, subject to the same duties, obligations, etc., as are imposed under the late Duke's testamentary writings.

The whole purposes of the Duke's Will continue operative as before, excepting only that there are separate bodies of Trustees to administer the two sections of the trust properties into which these have been divided.

Under the Duke's Will the debts affecting the estates having all been paid off, the present Duke is now beneficially entitled to the net annual income which these estates produce.

The estates in Lanarkshire, Stirlingshire and Linlithgowshire which the Trustees own, extend in all to about 56,500 acres.

There are portions of the estates in which, while the Trustees own the coal, they do not own the surface, but with a trifling exception (some 30 acres) wherever they own the surface they own the coal. Their entire

8 May, 1919.]

MR. TIMOTHY WARREN.

[Continued.]

	Acres.
ownership of surface and/or coal extends to	56,000
Of this area the coal actually on lease amounts to	20,500
Coal believed to be available but unlet	6,500
Coal which probably exists but has not yet been proved as workable	7,000
Areas wherein geological conditions preclude the existence of coal	22,000

The area wherein the coal belongs to the Trustees and the surface to other proprietors is somewhere about 2,900 to 3,000 acres. This is mainly in the Redding district, Stirlingshire.

To furnish particulars of the total output of coal and other minerals to date from the commencement of the collieries in each case is a wholly impossible task in the time allowed—if indeed the material is available—but calculations have been made showing the output of coal and other minerals for the last 10 years.

There are 41 coal leaseholds, and the output of coal, including 8 per cent. for colliery free fuel and workmen's free coal, since the term of Whit Sunday, 1908, has been as follows:—

Year.	Tons.
1908-09	4,394,210
1909-10	4,668,229
1910-11	4,692,039
1911-12	4,240,839
1912-13	4,733,456
1913-14	4,478,297
1914-15	4,033,138
1915-16	3,913,522
1916-17	3,877,559
1917-18	3,696,083
Total	42,727,372

10 years' average, 4,272,737.

The lordships on these outputs were as follows, viz.:—

Year.	Lordships.
	£
1908-09	121,802
1909-10	127,644
1910-11	127,460
1911-12	116,109
1912-13	125,511
1913-14	117,558
1914-15	106,003
1915-16	102,510
1916-17	100,056
1917-18	93,278
Total	£1,137,931

10 years' average, £113,793.

These lordships average on the output for the 10 years 6-391d. per ton of coal.

The lordships received from the working of limestone, ganister, fireclay, brick and tile works, quarries and sandpits are as follows:—

Year.	Lordships.
	£
1908-09	1,916
1909-10	1,853
1910-11	1,610
1911-12	1,338
1912-13	1,480
1913-14	1,479
1914-15	1,292
1915-16	1,334
1916-17	1,738
1917-18	1,528
Total lordships	£15,568
Average for 10 years	£1,556

As regards the respective contributions to the above—

	£
Limestone represents	2,102
Tilo and Brick works	2,417
Sandpits	5,429

the remainder being for quarries, etc.

No distinction is drawn in these figures as to what are or are not minerals properly so called.

The lordships on coal range from 4d. per ton fixed or 4d. to 5d. per ton in the lowest rated collieries—the figures varying for the different seams—to 10d. to 1s. per ton in the highest rated collieries—varying as before for the different seams. In every case but one the royalties are fixed—in that one case the royalty is 3d. to 8d. per ton of a minimum, or one-twelfth of the selling price under deduction of 4d. per ton.

The tonnage upon which wayleaves have been received for the 10 years ending Whit Sunday, 1918, and the amounts of the wayleaves are as follows, viz.:—

Year.	Tons.	Wayleaves Lordship.
		£
1908-09	248,694	1,190
1909-10	337,337	1,547
1910-11	395,948	1,793
1911-12	410,804	1,865
1912-13	472,231	2,116
1913-14	418,480	1,915
1914-15	362,722	1,584
1915-16	308,600	1,275
1916-17	340,990	1,486
1917-18	361,867	1,622
Gross	3,657,673	£16,393
Average	365,767	£1,639

The total rates paid during the same ten years ending Whit Sunday, 1918, including mineral rights duty since its imposition in 1910, amount to £200,358 or an average over the ten years of £20,035. Property tax is not of course included in that figure.

The origin of the titles of the ducal lands is in each case a Crown grant—the earliest being a charter by King Robert the Bruce to Walter, the son of Gilbert, and to the heirs by his wife, at that time Mary de Gourdown, of the lands of Machan in Clydesdale, granted at Dunbretan (Dumbarton), March 3rd, ninth year of his reign, 1315. There are an enormous number of other charters, and the titles in all are counted by hundreds. There are, in addition, a few properties which have been bought and paid for in the market in the ordinary way for the purpose of consolidating existing holdings."

14,818. Mr. Robert Smilie: How long has your firm been agents for the Duke of Hamilton?—Since the passage of the Hamilton Estate Act, 1918.

14,819. Who were the agents prior to that?—Messrs. Tods, Murray & Jamieson.

14,820. They were agents up to 1918. Who are the mineral agents for the Duke?—Mr. James Hamilton.

14,821. At Glasgow?—Yes.

14,822. Has he been mineral agent for a long period?—Yes, a considerable period—a good many years.

14,823. Do you remember who were the agents prior to James Hamilton?—I cannot tell you that.

14,824. Do you know anything really about the history of the Hamilton Estate, going back over a period of 40 or 50 years?—No, I certainly do not over a period of 40 or 50 years.

14,825. May we take it you can only speak with authority on the affairs of the Hamilton Estate since 1918, when your firm became law agents for it?—That and what I am creditably informed by responsible officials.

8 May, 1919.]

MR. TIMOTHY WARREN.

[Continued.]

14,826. Who are the responsible officials?—Mr. Hamilton, to whom we have already referred, and Mr. Storer, the late Estate Factor, and Mr. Webster, the present Estate Factor.

14,827. Have you consulted the previous agents in Edinburgh, who for many years were the agents of the Duke?—Yes.

14,828. Is your information based on your consultation with them?—Partly.

14,829. Do you know of any reason why they were replaced by your firm?—That is not for me to answer.

14,830. Do you know of any reason why they were replaced by your firm?—I say, that is no. for me to answer.

Mr. Robert Smillie: Sir, can the question be answered?

14,831. *The Chairman:* (To the Witness). Do you know the reason?—I was simply appointed; that is all I know.

The Chairman: Thou say so.

14,832. *Mr. Robert Smillie:* (To the Witness). Then you do not know the reason?—I do not.

14,833. You say the origin of the titles of the ducal lands is in each case a Crown grant?—Yes, under old charters.

14,834. Do you know a charter which conferred upon an early representative of the family the parishes of Hamilton and Glassford?—There is a charter which presented the barony of Cadzow which is now Hamilton.

14,835. Do you know whether there is one that specifically gives the parishes of Hamilton, Dalziel, Strathaven and Glassford?—I have seen some such charter, but the time in which I have had to investigate this has been very limited.

14,836. I understood you were really sent here to represent the Duke and with the knowledge which the Duke would possess?—I beg your pardon. I am sent here largely to represent the Estate Trustees.

14,837. It was the Duke who was really cited to come here but, because of his infirmity, it was decided to call you?—I am aware of that.

14,838. He appointed you to represent him, did he not?—Yes.

14,839. And you do not, of your own knowledge, know anything about the charter to which I refer which conferred four parishes?—I cannot speak of that particular charter.

14,840. Could you produce that charter?—I think we may be able to do so in time.

14,841. You say, "in time"?—Yes.

14,842. How long would it take?—You have to examine several hundred writs.

14,843. But surely that charter will be a document by itself?—No doubt. But you cannot put your finger upon it at once.

14,844. Would it take you a month, or a year, or ten years?—I think it could be done in less than that with an effort.

14,845. Could it be produced by to-morrow?—No, it could not be produced by to-morrow morning.

14,846. As a matter of fact you do not know anything about it?—I do not.

14,847. Do you know whether the parish of Dalziel was conferred also at the same time by that charter?—I cannot tell you that.

14,848. Do you know anything really about the matter which you came here for?—Yes.

14,849. It is the possessions of the Duke. You do know something about them?—Yes.

14,850. I want to put it to you that some of us on this Commission challenge the Duke's right to possess these mines and you have been sent here to speak for the Duke and represent the Duke?—Yes.

14,851. We want to challenge it, and I ask you if you knew anything about the legality of his position?—Yes, I think I know about that.

14,852. Will you undertake to produce the charter?—If the Chairman so orders me I shall endeavour to do so.

14,853. *The Chairman:* Yes. What is the date of it?—I cannot tell you off-hand. It is four to five hundred years old.

14,854. Will you send me personally some information about it and what is the date and so on?—Yes.

Mr. Robert Smillie: Perhaps, Sir, I may make an application at this stage. You may remember I made a request that certain dukes and earls might be called to give evidence here, and that they might produce the charters justifying their possession of certain lands. We waived that for the moment, because it was said that it would take a van to carry one gentleman's charters, and it might require a special train to carry the rest of the other charters. What we should like is to express our desire that while recognising that it may not be possible to produce those charters and deeds to this Commission in this room, yet we would ask you to allow us to put this matter into the hands of Counsel, and that those concerned might be asked to produce the charters which we would desire to counsel on both sides, one representing the owners and one representing ourselves, to examine.

Chairman: Yes. Is there any particular charter you want? You want the earliest charter to see the root of the title, I suppose.

Mr. Robert Smillie: Yes. We would give you, so far as we could, an account of the charters we wanted.

Chairman: Very well. If you will let me have that, I will communicate with these gentlemen.

Sir Allan Smith: Before that is departed from, I should like to know whether we are going into questions of title. I submit that we have not a right to go into questions of title, because the Act does not provide for it. All the Act refers to with regard to the matter of royalties is the incidence of the royalties and not the creation of royalties or the title to the land. Before we decide on this subject, I think the point ought to be discussed.

Chairman: We will discuss it. We shall have a private meeting either this afternoon or to-morrow, and Mr. Smillie will no doubt let me have an opportunity of considering the things he wants, and we will look into it.

Mr. Robert Smillie: Of course, it will be difficult in a few hours to do that.

Chairman: Yes.

Mr. Robert Smillie: I quite recognise that this application, which I thought it right to make in public, might be opposed, and it might be necessary for the Commission itself to discuss the matter.

Chairman: Yes. I may say that I hope to have a private discussion upon matters so far as they have gone, either to-morrow or Tuesday, just to compare notes and opinions as to our views of the evidence, and it might be convenient to discuss this question at the same time. I hope it will be to-morrow, but I am afraid it may not be until Tuesday.

Sir L. Chiozza Money: Will it not be this afternoon, as we thought?

Chairman: The trouble about this afternoon is that there are several gentlemen who—to use a colloquial expression—are hanging about while they are waiting to give evidence.

Sir L. Chiozza Money: With all respect to them, we are hanging about week after week and day after day. I think the convenience of the Commissioners ought to come before the witnesses, with all respect to the witnesses.

Chairman: Yes; we will endeavour to consult our convenience, but we will also endeavour to consult theirs.

The Witness: On this subject of title, it might assist the Commission to know that a large number of the Hamilton charters are described in the

8 May, 1919.]

MR. TIMOTHY WARREN.

[Continued.]

Historical Manuscripts Commission Report, published by Eyre & Spottiswoode in 1887.

Chairman: That would be a Government publication.

The Witness: Yes, it is a Parliamentary Commission.

Chairman: We will have it circulated.

14,855. *Mr. Robert Smillie (to the Witness):* Are you aware that it is also pretty fully gone into in a book entitled, "Our Old Nobility"?—Yes.

14,856. You are aware of that?—Yes, but not so fully.

14,857. I think it goes fairly fully into the methods by which the dukes and earls and other landlords got possession of the land of this country and of Scotland.

Mr. R. W. Cooper: Who is that published by?

Mr. Robert Smillie: I do not remember at the moment, but I will let you see a copy to-morrow.

14,858. I understand that at the time of the death of the late Duke a considerable amount of debt had hung over the estate?—That is quite right.

14,859. Could you tell us how much debt was paid off?—I have not been asked to furnish that information, and I cannot.

14,860. Do you say you cannot, or do not wish to?—I cannot; I do not know.

14,861. Then that is the answer—you do not know?—I do not know.

14,862. If you say you do not know, that is all right. But you do say that the debts were paid off?—Yes.

14,863. What was the allowance of the present Duke on his appointment?—£10,000 a year.

14,864. Then, I understand, it was raised at a date a few years afterwards?—I do not think so.

14,865. Is it not a fact that it was raised to £20,000 a year?—There may have been some payments made on account of the estate.

14,866. Not on account of increased cost of living, but on account of the estate?—Yes.

14,867. Is he now in possession of the total income of the estate?—Yes, as from a few years before the war.

14,868. Do you know the average income of the late Duke of Hamilton?—I do not know.

14,869. Should I be putting it too high if I said £240,000 a year?—I cannot tell you, because I do not know.

Mr. Robert Smillie: I do not know whether it is any use putting these questions to this witness, but I submit they are really relevant. I asked him the income of the late Duke of Hamilton, and he said he did not know; I asked the amount of the debt cleared off, and he does not know—and yet he comes here as representing the Duke of Hamilton.

Witness: I beg your pardon! I came here to answer certain specific questions addressed to me by the Chairman. I have the intimation here.

Mr. Robert Smillie: Is that so, sir?

Chairman: I think what was done was that a number of questions were sent round, and I think on Mr. Smillie's suggestion, but I can find out in a moment. Mr. Smillie was good enough to say that he wanted these gentlemen to attend for certain purposes, and we indicated to them those purposes. I suppose in cross-examination a witness must tell us anything he can.

Mr. Robert Smillie: The enormous importance of this question is that on the Hamilton Estate there is a very large number of workers who, with their families, for over 30, 40 or 50 years have been kept on the verge of starvation and living under miserable conditions. We are now asking for the taking over, either by confiscation or payment for the royalty rents, in order to nationalise the mines. We desire really to get information as to whether there is any justification for them, and I want to put these questions. As a matter of fact, we represent an enormous number of people in this country who are absolutely landless for miles and miles around where the Duke's palace is. Surely we are entitled to know something about that!

Sir L. Chiozza Money: The witness says he came here to give evidence on specific points, and he has

taken an oath to tell the truth, the whole truth and nothing but the truth. If he says he knows nothing about these things, of course, we at once accept his word; but can we have someone who does know something about it? This is extraordinary, if I may say so.

Chairman: I quite agree with you; I am not at all differing. At the present moment all this witness says is that he does not know. Then we must consider later on, if we want to ask those questions, who will know; but it is no use asking this gentleman questions that he does not know.

Sir L. Chiozza Money: I do not want to make comments in public, but it shows the whole irresponsibility of the royalty system. The Duke is infirm and the agent knows nothing.

Chairman: Had we not better get on with the cross-examination? Mr. Smillie asks a question, and the witness says he does not know, and we cannot get more than that at present.

14,870. *Mr. Robert Smillie (to the Witness):* I think the late Duke's family consisted of one girl?—That is right.

14,871. When the Duke died the Marchioness of Graham was said to be the richest heiress in Great Britain, was she not?—I do not know.

14,872. Do you know whether or not he left her poor?—"Poor" is a very elastic word.

14,873. It is, as I can assure you. As between the workmen and miners and a duke it is very elastic?—I should not have thought he left her poor.

14,874. He left the Island of Arran to her, did he not?—Yes.

14,875. Were there any burdens upon it?—That I cannot say; I do not know.

14,876. You do not know whether his income was about £240,000 a year?—I believe it was a very large income.

14,877. I suppose it may be taken that it was a reasonable living wage for an ordinary family?—I have no objection to your putting it in that way.

14,878. Do you happen to remember that at one time the Duke had to sell his racehorses to keep going?—I do not remember that.

14,879. Do you remember how many mansion houses the Duke of Hamilton's family possess?—They have Hamilton Palace, Brodick Castle, Chatelherault, Dungavel and Easton Park.

14,880. Dungavel is a shooting lodge, is it not?—Yes.

14,881. Do you know if they possess any mansion houses in England?—I have spoken of one, Easton Park.

14,882. Do you know Hamilton?—Oh yes.

14,883. Do you know the Palace?—Yes.

14,884. You know it well, I suppose?—Yes, pretty well.

14,885. It is a fairly large building, is it not?—Yes, it is a very large building.

14,886. And it has a good many apartments in it, has it not?—A large number.

14,887. I understand—or at least I know—that it stands in a very large enclosure surrounded by a pretty high wall?—Yes, that is right.

14,888. I suppose you know that just outside that wall on the western side of the Palace are some of the most miserable homes in Great Britain of working people, miners and others?—I cannot use comparative terms; there are very indifferent houses there.

14,889. A whole lot of slummy dwellings?—Yes, hundreds of years old, I should think.

14,890. Are you aware that in the town of Hamilton the miners' families—the families of the men who are producing coal from the Duke of Hamilton's mines—are living 4, 5 and 6 per apartment?—I cannot say that I am aware of that.

14,891. Have you read the evidence before this Commission to that effect?—I have not.

14,892. Have you any reason to doubt my statement?—I do not doubt it, if you say so.

14,893. I suppose the Duke of Hamilton's income from royalties would be remarkably small if the miners working at the collieries on the Hamilton Estate were not working?—I should not think it would be existent,

8 May, 1919.]

MR. TIMOTHY WARREN.

[Continued.]

14,894. There would be no royalty rents?—I should think not.

14,895. Consequently the present Duke himself and the other dukes that went before him never contributed personally anything at all to their income from the royalty rent?—They contributed their property.

14,896. They contributed their property to the production of coal from the pits?—The coal is their property.

14,897. You say the coal is their property?—Yes.

14,898. Are you aware that we have not yet seen the titles?—I am quite aware of that.

14,899. Are you aware that there is an old Scotch law of 1592 which confers all the metals and minerals found in the land of Scotland on the Crown?—All metals and minerals *inter regalia*.

14,900. All metals and minerals in the ground?—Gold and silver—not coal.

14,901. And coal: are you sure of that?—Yes.

14,902. Have you read the Act?—I have.

14,903. Does it say gold and silver?—No, it does not. I am aware it says "mines and minerals," but it has been subject to legal interpretation.

14,904. Does it say mines and minerals of all kinds whatsoever?—I cannot give you the exact language of the Act.

14,905. I have it here: it says mines and minerals of all kinds?—I knew the Act.

14,906. Do you know there are very old charters granted which specifically mention coal?—Yes.

14,907. Are you aware that it was laid down in that Act, which is still the law of Scotland, that 10 per cent. of the value of all minerals and metals worked from the ground must be taken into the Crown?—I am aware of that provision of the Act.

14,908. Could you tell us how much the Duke of Hamilton or the trustees of the estate have paid into the Crown under that law?—Nothing, because the Act does not apply.

14,909. You may, if you please, express your opinion that it does not apply.—Well, it has been the subject of legal interpretation.

14,910. When?—In two cases.

14,911. Will you give us the cases?—I am afraid I shall have to find the references, because I do not carry these things in my head. One case is Ochterlong and the other is an action in which Lord Breadalbane was concerned about 40 years ago. (*The reference to Lord Breadalbane's case is 1875, Court of Session, 2 Rettie Reports, p. 826: the Ochterlong case is referred to therein.*)

14,912. Do you remember, or has your attention been called, to the fact that away back in 1846 a question was asked in the House of Lords about this old Act?—I am afraid I do not remember much in 1846.

14,913. I asked if your attention had been called to the fact. I do not remember 1846, for I was not born then?—I have never had my attention called to that fact.

14,914. Are you aware that Lord Merpleth, replying to Lord Lincoln in the House of Lords, with regard to a case in which an action was raised against a person who had opened up mines to produce Black Band ironstone, said: "That the law of Scotland and England was different on the point, and that all the metals were reserved in Scotland to the Crown, but that he expected and proposed to bring in a Bill to simulate the laws of the two countries, but he could not do so until the next session of Parliament"?—I am not aware of that.

14,915. Are you aware that down to the present time that has not been done?—I am aware it has not been done.

14,916. You know it has not been done, and you are aware the law of 1592 is still the law of Scotland?—Subject to the legal interpretation which it has received.

14,917. Would you please supply us, when you get time to do so, with the two cases which you refer to as giving that interpretation?—I will supply you, if I may, with these cases, and with quotations from text books.

14,918. *Chairman*: Will you tell us where they are reported? I read one the other day in the

Scottish Law Reporter of 1875.—I will supply a note of them to you or to your Secretary.

14,919. *Mr. Robert Smillie*: One question I think you will be able to grasp is this: I was trying to make out that if the Duke of Hamilton has been illegally working or allowing to be worked by lease minerals on the Hamilton Estate including coal, and if he has been doing that wrongfully—which for the moment I will not suggest he has been—then I want to ask you whether that is just to the nation itself?—Of course, if he is not entitled to the property, it is obviously unjust.

14,920. If the miners are risking their lives underground in producing coal, and the Duke of Hamilton claimed a shilling a ton royalty rent on that coal while they were only paid a shilling a ton for cutting coal, would not that be most unfair?—I have said if the Duke or Duke's trustees do not own the coal, it is obviously unjust that they should take the royalties.

14,921. That is to say, if he is in wrongful possession of the coal, it would be unjust.—Manifestly.

14,922. Now I want to put this to you. Do you think it would be unjust supposing he owned the coal, that he, living in Hamilton Palace, and being very often on the Riviera and at racecourses and other things, should be getting one shilling a ton from every ton produced by a miner who risks his life, and that the miner should be getting less than a shilling a ton and going down and cutting the coal? Would that be manifestly unfair?—No.

14,923. Would that not be?—No.

14,924. Is it manifestly unfair that the Duke of Hamilton or any other duke should draw £120,000 a year from royalty rents while nearly all the miners working at the collieries on his estate were drawing less than that in wages to keep their families? Is that not unfair, do you think?—I do not think so.

14,925. I think you said you do not think so?—I do not think so.

14,926. We have been at war for four or five years, have we not? I think you will not deny that. I think you will agree there has been a war going on on the Continent for some time?—Oh yes.

14,927. I think you will agree that within a radius of 10 or 15 miles of Hamilton Palace a very considerable number of men left the Duke's coal pits—men and boys—and went abroad in His Majesty's Service, either in the navy or army?—I hope they did from all parts of the country. I myself had four sons who went to the war.

14,928. And I had two sons who went too. I am dealing for the moment with the Hamilton Estate, and we might confine ourselves to that. They went from all parts of the country, but I want to confine ourselves to the Hamilton Estate and see how they fared there. A very large number went from collieries from which the Duke of Hamilton is claiming coal royalties?—No doubt.

14,929. In many cases their families were not too well off when the father or sons were away. Should I be right in saying that?—I think that was a common experience.

14,930. Was it not to defend their country that they went abroad?—Doubtless.

14,930. "Their country," in what sense. Did any of them possess any of their country?—They were citizens.

14,932. And that conferred on them, I suppose, the right to join the army, or at least it conferred on them the responsibility?—Yes, the duty.

14,933. The duty or responsibility to join the army to defend their country?—I think so.

14,934. Is it not a remarkable thing to ask people to defend their country if they really do not own a single acre of their country, but it is owned by some one else?—I do not think possession of acreage is necessarily a corollary to the rights or duties of citizenship.

14,935. The duty of citizenship ought to carry with it in the case of a Duke, ought it not, that where his citizenship and his estates and his royalty rents are being defended, he should endeavour to look after the families of those who go to defend his royalties and his land? Would not that be a duty of citizen-

8 May, 1919.]

MR. TIMOTHY WARREN.

[Continued.]

ship?—From a philanthropic point of view, I should think it would be quite a fair thing to do.

14,936. Do you mean the charitable point of view?—I do not see any legal obligation to do it.

14,937. No, unfortunately there is no legal obligation, but I think there is something much higher than the legal obligation?—I am afraid that is rather outside my province.

14,938. Was not there a very serious danger that if the boys had not gone, his Grace might not have had royalties or land at the present time?—I think that applies not only to his Grace, but to the whole country.

14,939. I want you to confine it for the moment to the Duke?—But I do not think you can set up the Duke as a subject of special remark in that regard.

14,940. Just for a moment I will, because I will deal with the others when they come. I have no more personal feeling against the Duke than any other person in the world. I am only using him as an example. He is not a bad man at all, so far as I know, but I want to confine myself and yourself to the facts about the Duke on whose behalf you are here to give evidence. I think it may be taken that is so. You say he possesses the Palace and you say he possesses the shooting lodge, which might be taken to be a shooting lodge of about 14 feet square; but it is a great big house, as you know. He possesses two or three other mansion houses. I think the Palace has about 365 windows, has it not?—I have never counted the windows.

14,941. I have heard it said they ought to be 366, but they bricked up one window to escape the Window Duty at the time.

Sir Allan Smith: Sir, I have no desire to interfere with the proceedings, or to restrict free cross-examination by any of my colleagues, but we are not interested in the Duke of Hamilton alone or in his relatives. We are not interested in his establishment, and I submit to you that the time which has been occupied—I will not say wasted—within the last fortnight makes some of us rather apprehensive as to the progress we are expected to make by June 20th. Therefore I submit to you that it would be wise if you were to exercise your discretion a little more on the points which are relevant to the issue.

Chairman: I am much obliged to Sir Allan Smith. Of course one has to look at the Act of Parliament in order to see what is our mandate, and the mandate is this: "His Majesty shall have power to appoint Commissioners, consisting of a chairman, who shall be a Judge of the Supreme Court, a vice-chairman, and such other persons as His Majesty may think fit, for the purpose of enquiring into the position of, and conditions prevailing in, the coal industry, and in particular as to . . . (e) the social conditions under which colliery workers carry on their industry." That is a very wide sentence—"the social conditions under which colliery workers carry on their industry." I quite agree with your remarks that we want to finish in time, but I think Mr. Smillie is in order. No doubt he will confine himself as briefly as possible, because he, just as much as we, is interested in getting the report by the 20th June. Clause (e) "the social conditions under which colliery workers carry on their industry" is so very wide that I think Mr. Smillie is not out of order.

Mr. Robert Smillie: I am sorry to be wasting so much time.

Chairman: I did not say you were wasting time.

Mr. Robert Smillie: No, but it is hinted at. If Sir Allan Smith were as deeply interested in the conditions of the workmen of Lanarkshire as I am, he would be as anxious as I to protest against an income of £200,000 being paid to one man when there are starvation conditions for those producing that income, and I believe I am quite in order in endeavouring to bring that out here. I was coming to this point, that the mine workers who are producing the income of the Duke of Hamilton are herded together under conditions which cannot be justified, and in Hamilton they are living two or three families in one house within a few hundred yards of a palace where the Duke of Hamilton and

his family are living in a house of more than one hundred apartments.

Witness: That is a heritage from past generations which I think ought to be corrected.

14,942. Could it be corrected at the moment unless we got more houses built?—No, it could not be.

14,943. Would there not be room in the Palace for a number of miners' families who produce the Duke's wealth to go there and stay until the houses are produced, and would it not be better that they should take a little portion of the Duke's palace rather than be sent to a sanatorium from time to time owing to illness arising from their surroundings?—I am afraid the Palace will very soon cease to exist.

14,944. Will they carry it away?—No, but the underground workings are affecting it.

14,945. As a matter of fact you know they are going to leave it on an island in the midst of a surrounding sea?—You must not say that I know; I do not know anything of the kind.

14,946. If you used your eyes and were there from year to year, you would see that it is left on an island?—If I may say so your information is wrong.

14,947. I was looking at it a few weeks ago. However, in the meantime it is still there, and we might get some of our people lodged in it until we get houses so as to prevent the sickness in their families which is caused by overcrowding. I should like to put it to you as a man, and not as a lawyer or the agent of the Duke: Do you think it is a natural fair condition of things that the workmen risking their lives every day in producing mineral wealth from which the Duke gets his income should be living under those conditions, and where the person who does not do anything for that income is living in a palace with other palaces to shift to from time to time—ought that to continue?—I say the conditions of the miners' houses ought to be remedied; I have said so.

14,948. Would you suggest some method by which they might be remedied?—I am afraid I cannot do that.

14,949. Are you aware that it will take perhaps two or three years before it can be done?—I should think it will take longer than that, if I may say so.

14,950. Could you tell us what the nature of your lease is, generally speaking, which is given to people who take a small portion of the surface from the Duke so as to build a house? Do you protect their houses against the extraction of the minerals from underneath it?—Do you mean leases or feus?

14,951. Feus?—A feu contract is a long document. Will you tell me the particular point you want information on?

14,952. Do you reserve the right, after you grant the feu, to extract the minerals from underneath the house without compensation?—Every feu contract on the Hamilton Estate, so far as I know, contains a standard clause which reserves, as is the common experience in Scotland, to the superior (the landlord) the mines and minerals in the lands feued, and in the case of the Hamilton Estates there is that right to work them without providing compensation for the damage by subsidence.

14,953. Is it the fact that the late Duke and the present Duke or, rather, their representatives, have granted in hundreds of cases a feu to working men who have put their life savings into the erection of houses, and then that the houses were wrecked by the taking out of the minerals underneath?—I should hesitate to say that they have granted hundreds of feus to working men. I think they have granted a large number of feus to different people, but I do not think they have granted hundreds of feus to working men.

14,954. Would you be surprised to know that in the little village in which I live they have granted feus to a working men's society for over 100 houses?—That is one society.

14,955. Yes, but do they not claim the right to take the minerals from under all the houses?—Yes; but I am answering your question. You said hundreds of working men. I do not think they have granted feus to hundreds of working men.

14,956. I am speaking of a case where a society of working men come together and decide to build

8 May, 1919.]

MR. TIMOTHY WARREN.

[Continued.]

100 houses. Each holds a feu individually. Do you not know that that is the case?—I see your implication.

14,957. The Duke claims the right, in the first instance, to an income from the royalty rents on the coal which the miners produce at the risk of their own lives. Then he claims something further if he gives them a feu to build a house. You know working men are being encouraged to build their own houses, and the Duke claims the right to take out the minerals from under the house and wreck the house without compensation?—"Claims the right" is hardly the right way to put it; it is a matter of bargain.

14,958. "It is so nominated in the bond"?—Yes.

14,959. Do you justify a position of that kind?—I do not see any reason why people should not be left free to use their own judgment in a matter of that description under advice.

14,960. No. Do you say that a person should not be interfered with from doing what he likes with his own?—I agree.

14,961. That is your position?—Yes.

14,962. *Sir Allan Smith*: There is only one point I should like to ask you about. Does the Hamilton Estate Act of 1918 narrate the title?—No.

14,963. Does it grant a conveyance in favour of the trustees?—It directs conveyances shall be granted in favour of the trustees.

14,964. So that it admits that the ancestor held the land and admits the right of the ancestor, or someone on his behalf, to give a title to the trustees under the Act?—That is so.

14,965. *Sir Adam Nimmo*: We have heard a great deal about the question of title. I take it you have no doubt whatever about the validity of the titles of the Duke?—None whatever. If I may explain, the law of Scotland is perfectly clear on the subject. Forty years prescription following upon an *ex facie* valid title makes a title invulnerable against all the world.

14,966. That is the point I was coming to. I am very glad you have dealt with it in that way. You have been in possession of these lands and minerals here for practically an indefinite time?—Yes, time immemorial.

14,967. And you have constantly acted upon the rights which you believed you had?—Absolutely.

14,968. We have heard a good deal about the housing question this morning and a good many questions have been put to you with regard to that. I do not want to go into that question at all except to ask you this question, as to whether you would agree with me when I put it in this way, that after all the question of housing is a national question?—I do agree.

14,969. Mr. Smillie has referred to certain houses on the Duke of Hamilton's lands. I take it that these houses may or may not be occupied by miners?—My impression is that they are very largely occupied by people who are not miners.

14,970. *Mr. Robert Smillie*: What houses are they?—They are in the Old Town. I think there are a good many people who are not miners there.

14,971. "A good many," but you said "largely"?

14,972. *Sir Adam Nimmo*: That is to say, they are being occupied by the working classes generally, whether those workmen are employed in the mines or otherwise?—Yes. Speaking on that subject, as there has been so much said against the Duke of Hamilton, I should like to say this: before the war the Duke's trustees were in negotiation with the town of Hamilton with reference to a renovation of these houses and I have a letter in my pocket from the Provost of Hamilton setting out the circumstances, and if Mr. Smillie would like me to read it I will do so.

14,973. *Mr. Robert Smillie*: Does that deal with the £500 per acre he wanted?—No, it is quite a different thing.

Mr. Robert Smillie: I should like to see the letter.

14,974. *Sir Adam Nimmo*: I think we all desire to see the working classes of the country housed as comfortably as possible?—I hope so.

Sir Leo Chiozza Money: On a point of order, Sir Adam Nimmo raised a question as to the relevance of certain questions and now he asks the question, do we desire to see the working classes housed properly? I ask, Sir, what relevance that has to our enquiry?

The Chairman: I must rule, as I did five minutes ago, that Sir Adam is in order.

Sir Leo Chiozza Money: He used the word "we" but we want the witness's evidence and not Sir Adam's.

The Chairman: That is his way of putting it. We quite understand it.

14,975. *Sir Adam Nimmo*: My point is that this is not a question which belongs solely to the mining industry?—Quite so.

14,976. Nor does it affect particularly any mineral royalty owner?—I think that is obvious.

14,977. It is one which is really a national question which will have to be dealt with from a national point of view?—I agree.

14,978. And when it is dealt with the Duke of Hamilton or other dukes will have no doubt to bear their share of the burden which has to fall upon the nation to provide that housing accommodation?—No doubt.

14,979. Now I am more concerned about certain practical questions in regard to royalties which concern us more here to-day. I take it from your *précis* that the Duke of Hamilton owns very large mineral areas?—Very large areas.

14,980. And also I gather that these areas are very largely occupied by mineral operations?—20,500 of them.

14,981. I notice in your *précis* you suggest certain areas remain unlet?—Yes.

14,982. I have a considerable knowledge of the Scottish coalfield. May I put it to you that the coal in these areas which you refer to may be regarded as very problematical?—There are two areas and, if I may say so, on the authority of the Estate mineral engineer, the area which is stated to contain 6,500 acres of coal, believed to be available but unlet, is an area where it is believed the upper coal seams are off and only the lower seams are available. The second area is very doubtful indeed.

14,983. Do you hold the view that if coal owners in Scotland knew that areas of coal that were so far unwrought were available and likely to produce coal, they would not be readily taken up?—I have no doubt whatever about it.

14,984. The point I want to make is this: is it not your experience in connection with the development of the mineral areas which you are concerned with that private enterprise has been entirely adequate fully to develop these areas?—That has been my experience, acting for a large number of owners of mineral properties.

14,985. And that these areas have been developed as rapidly as the general industrial situation of the country would permit?—Yes, quite satisfactorily in my opinion.

14,986. Coal has been produced to the fullest extent possible to meet the whole development that was taking place in other directions?—That is my view.

14,987. Have you had any considerable exploration for minerals in the Duke of Hamilton's lands which has been unfruitful?—I am afraid I do not know.

14,988. But I think we may assume that, dealing with large areas like these, there has been a good deal of exploration work which has been undertaken by private enterprise which has been unfruitful?—I know of some cases where that is so.

14,989. I know of some cases myself?—I had one under notice recently.

14,990. Where private enterprise endeavours to discover minerals have not been successful?—Yes.

14,991. And considerable sums of money have been expended in the effort?—Yes.

14,992. Now coming to the question of efficiency of working, in dealing with the leases that you are concerned with I know that you will have an intimate knowledge of the terms and conditions of these leases:—Do you know whether they provide for the efficient working of the coal?—In every case.

8 May, 1919.]

MR. TIMOTHY WARREN.

[Continued.]

14,993. Are the clauses which are put in the leases inserted upon the advice of expert mining engineers?—They are.

14,994. Who understand the whole conditions?—That is right.

14,995. And whose knowledge is not confined to one particular coalfield?—That is so.

14,996. And do these clauses ensure that so far as practicable all the coal which is let is taken out?—That is the obligation of the lease.

14,997. And, further, is there not a great obligation upon the lessee to take out the coal, because if he does not take out the coal he may be compelled to pay for it?—It is manifestly to his interest to take out such coal as is possible.

14,998. Now it has been suggested that the mining industry is not handled as scientifically as it might be. Are there certain clauses in the leases that you have to deal with which insist upon the whole of the workings being carried on in a scientific manner?—That is quite right.

14,999. Have your mining engineers a right of intervention at any time when they think the coalfield is not being handled properly?—That is quite right.

15,000. Do they make regular surveys of the workings and regular examinations in the interests of the proprietors?—They do, and, I have no doubt, from an expert point of view.

15,001. They are doing everything in their power to see that the coal is fully worked and properly worked?—They are sometimes, speaking from the other point of view, rather difficult to satisfy.

15,002. I have no doubt in reading the papers you have seen that certain questions have been raised here as to the removal of barriers which are supposed unnecessarily to exist in connection with the coalfields?—I have seen that.

15,003. I want to put this question to you: I take it in connection with the coalfields that you are responsible for that your engineer considers in every case whether a barrier should be left or not?—He does.

15,004. His interest will be to leave as few barriers and as small barriers as possible?—Naturally.

15,005. And he will only leave barriers where he thinks it is necessary from a practical point of view to have them left in?—I am sure of that.

Mr. Herbert Smith: Sir, is this a proper kind of evidence? The witness is being asked what another man does. Should we not have the engineer and ask him? I think it is improper to ask a man what another man thinks, and what is only what the witness is told.

Sir Arthur Duckham: It has been done so often.

Sir Adam Nimmo: Sir, I am obliged to put it in this way. Mr. Warren is one of the most experienced legal gentlemen in Scotland, and I am sure he has a very large intimate knowledge of leases, and he is very fully informed of the terms of the leases and is bound to know the effect of practical application in working these leases. I submit it is quite proper I should put the questions which I have put.

Mr. Herbert Smith: I want to suggest that this witness knows nothing about whether a mine is scientifically carried on.

15,006. *Chairman:* What is the name of the gentleman who gave this information? *Sir Adam Nimmo:* He has asked you the question whether an eminent engineer is not of a certain opinion. Who is he?—I said that earlier in my evidence. It is Mr. James Hamilton.

Chairman: Very well, we will subpoena him and get it from him.

Sir Adam Nimmo: Sir, may I put the position to you which I have put to the witness? I know he has experience of these mineral leases. I am merely asking whether what I suggested is contained in the mineral lease, and he says yes.

Mr. Robert Smillie: Do you mean with regard to the Hamilton Estate?

Sir Adam Nimmo: Yes.

Mr. Robert Smillie: And he has been less than a twelvemonth connected with it. I put it to you that we cannot have had much experience of the mineral leases on the Hamilton Estate.

Sir Adam Nimmo: I asked Mr. Warren whether it is not within his knowledge that these things are within the leases of the Hamilton Estate.

Witness: There are 41 leaseholds, and I have dealt with 15 to 20 of them.

Chairman: Very well.

15,007. *Sir Adam Nimmo (to the Witness):* I assume there is a national problem that exists in connection with barriers of, let us say, waterlogged areas, or, let us say, the holding up of coal contrary to the national interest, arising in one way or other. Would you agree that it was desirable that we should remove these difficulties, and so free the whole of the coal possible in the national interest?—I would.

15,008. As a general proposition?—Yes.

15,009. You would consent to that?—Yes.

15,010. As a person interested in the Hamilton Trustee Estates, you would advise that that position should be accepted?—I would.

15,011. May I put another general position to you, because I think it right to get it from you as a man of very large experience. Do you think it is necessary or desirable to nationalise the minerals in order to deal with a problem of that kind?—I see myself no necessity for it. My experience, dealing with mineral owners, has been eminently satisfactory as evidencing a very strong desire to get out of the coal areas as much coal as it is possible to extract.

15,012. And on the whole I suppose you would say that the mineral royalty owners desired to be reasonable towards the coal owners who are working their minerals?—They would not let the minerals otherwise.

15,013. No doubt there are exceptions to every case, but we have to deal with the position in the main. Would you agree that it would be quite possible in order to deal with difficulties of that kind to set up some kind of simple and direct form of machinery which would enable us to dispose of that?—I think it might be a matter of reference to some kind of tribunal.

15,014. Some kind of tribunal which would have full power given to it to dispose of all these questions?—I see no difficulty about that.

15,015. And to whom some application could be made either by the individuals concerned or, say, through some central mining board established in connection with the Mining Department?—Quite so.

15,016. May I put this question to you: It has been suggested that the form of machinery would be very cumbersome and very expensive, and I ask if it occurs to you whether that form of machinery would be more cumbersome and more expensive than machinery under nationalisation?—I should think it would be a very simple method of dealing with matters.

15,017. *Sir L. Chiozza Money:* What would be simple?—A simple tribunal to consider these applications as they come in.

Sir L. Chiozza Money: I am under the disadvantage of not being able to distinguish between the questions put to the witness and what the witness's answers are.

Sir Adam Nimmo: May I understand the reason of *Sir Leo Money's* interposition? He rather imputes certain comments to myself, I think, in dealing with these questions.

Sir L. Chiozza Money: No; it is most interesting, but it appears to be *Sir Adam's* evidence and not the evidence of the witness.

Sir Adam Nimmo: I protest against that, sir.

Chairman: You are quite in order.

Sir Adam Nimmo: I think these interruptions should be stopped once and for all. If it is done for the purpose of making an impression against myself, I can understand it, but I think I am entitled to your protection in a matter of this sort.

Chairman: You have it that I think you are in order, and that you are entitled to go on.

Sir L. Chiozza Money: May I ask on a point of order whether I am entitled to re-examine on these questions?

8 May, 1919.]

MR. TIMOTHY WARREN.

* [Continued.]

Chairman: No, no one can re-examine; you may cross-examine. The only person who can re-examine is myself.

Sir L. Chiozza Money: Yes, I meant cross-examine.

15,018. *Sir Adam Nimmo (to the Witness):* Assuming such a tribunal existed, would you say that many applications would be likely to be made to it?—Do you mean by mine owners or landowners?

15,019. Yes, or even by, say, the Central Mining Council, to which I have referred. Would not the parties, knowing that such a tribunal existed to deal with any difference between them, be more likely to settle between themselves without coming to a tribunal at all?—It is very difficult to say; they might prefer the tribunal.

15,020. But on the whole would not the setting up of the tribunal have the effect of inducing them to settle in many cases?—It ought to have that effect.

15,021. I take it, as representing the large interests that you speak for, you do not want nationalisation of minerals?—We do not. We see no necessity for it.

15,022. You do not think it would be in the national interest?—I do not.

15,023. But I take it that you look upon the rights that you have as being private rights?—Yes, private rights of property; that is quite right.

15,024. And if the State proposes to take away these rights from you, I take it that you will desire to have a fair price for what is taken away?—I hope so.

15,025. Would it not be right even to suggest that the State in a matter of that sort should be a somewhat generous dealer with the men whose property it proposes to interfere with?—I think if the landowners' rights are to be purchased, they ought to be purchased on a fair basis.

15,026. Do you think if any suggested depreciation of these rights could be made out on the ground either of the findings, let us say, of this Commission, or in any other way, that that would be a justifiable reason for cutting down the price to be paid?—I do not.

15,027. It ought to be a fair price having regard to what is taken away?—I should say so.

15,028. I suppose you would agree that the price to be paid in the event of the nationalisation of the mineral rights would be better fixed by quite an independent outside tribunal?—I really have not considered that. I should like to consider that before I gave a reply to it.

15,029. But what you would desire, I take it, would be to see that the whole of the circumstances were carefully investigated?—Absolutely.

15,030. And that the price was based upon the facts in each individual case?—I agree.

15,031. *Chairman:* Will you let us see the letter which you were good enough to refer to with regard to housing in Hamilton?—I will read an extract from it, if I may, because it is a private letter.

15,032. Will you kindly read an extract? What is the date of the letter?—The date is the 30th April, 1919, and it is from the Provost of Hamilton to Her Grace the Duchess of Hamilton:—"The position of matters is that previous to the outbreak of war in 1914, we" (that is the local authority) "were engaged in negotiation with the Hamilton Estates with a view to getting the older part of the town entirely renovated and all buildings of a slum character removed. In particular, I, along with some of my colleagues, had several interviews with the late Major Poore and Mr. Wallace" (they were the Duke of Hamilton's representatives) "and Mr. Lochhead, of Callen, Lochhead and Brown, was called in to assist, and he made a rough plan showing the suggestions that had up to that point been made, although nothing definite was settled. As your Grace indicates, one suggestion was that part of the adjoining ground within the present wall should be made available for the erection of new houses for the displaced population. It is only proper to state that Major Poore and Mr. Wallace were most sympathetic and helpful in their suggestions, and I have no doubt whatever that had the war not super-vened the work of renovation would by this time at least have been in process."

Sir L. Chiozza Money: May I put a question?

Chairman: No. I think we must finish with this witness now. I called upon you before.

(The Witness withdrew.)

ALAN IAN PERCY, DUKE OF NORTHUMBERLAND, SWORN and Examined.

15,033. *Chairman:* This is the evidence of the Most Noble Alan Ian, Eighth Duke of Northumberland:—

"Witness will state:—

1. That he succeeded to the title and estates of the Dukedom of Northumberland on the 15th May, 1918.

2. That he is in attendance in response to a request received from the Commissioners and embodied in a letter of which the following is a copy:—

Coal Industry Commission,
2, Queen Anne's Gate Buildings,
Westminster, S.W. 1.
30th April, 1919.

MY LORD DUKE,

I am directed by the Chairman to inform you that the Commissioners having entered upon the second stage of their enquiry are proceeding to consider and report upon the principle of Nationalisation of Mines and Minerals.

They have had under consideration the evidence to be taken at this stage of the enquiry, and they will be indebted to you if you will be good enough personally to come and give evidence.

I am, therefore, directed to ask you to prepare a short *précis* of the evidence upon the following points:—

1. The acreage of your holding of land and of the proved mineral rights.
2. The total output of coal and other minerals to date.
3. The average annual output of coal and other minerals.

4. The royalty payable per ton, whether fixed or on a sliding scale.

5. The average annual income received by you from mineral royalties and wayleaves, and

6. The nature of the root of your title or titles.

I am unable at present to state definitely on what day you will be asked to appear, but it will probably be in the first half of next week.

I must, therefore, ask you to be good enough to let me have at this office on Monday morning, the 5th May, a short *précis* of your evidence to be printed and circulated to the Commissioners, and at the earliest possible moment I shall inform you more precisely as to the day on which your evidence is likely to be reached.

Will you kindly acknowledge receipt of this letter?

I remain, etc.,

(Sgd.) ARNOLD D. McNAIR.

In reply to the several questions raised by the above letter, the witness will state as follows:—

I. The acreage of his holding of surface land is approximately 169,000 acres. The acreage of the proved mineral rights is approximately 244,500 acres. In this latter area is included about 168,500 acres of the lands comprising the 169,000 as both surface and mineral rights of these form part of the estates of witness.

II. It is impossible to say what has been the total output of coal and other minerals to date upon witness' own property. There is evidence that coal

8 May, 1919.]

ALAN IAN PERCY, DUKE OF NORTHUMBERLAND.

[Continued.]

was worked from part of the property as long ago as the 13th century, and probably it has been worked more or less continuously from portions of the estate ever since.

No records exist as far as witness is aware of the output in the 13th century or for some hundreds of years afterwards.

Moreover, it has been quite impossible in the time suggested by the letter (less than a week) to compile from the records in the possession or under the control of witness the total output of coal and other minerals of which there are records. These date back for a considerable period, and it would involve a long research in order to compile any reasonably complete return.

III. Witness supposes that this question is intended to be supplemental to question 2, and therefore, like No. 2, cannot be answered.

Witness has, however, given directions for the preparation of a return relating to his property extending over the past six years, viz., 1913-1918 inclusive. As the result of so doing, he is able to state that for that period there was approximately an average annual output of 1,950,044 tons.

IV. The average royalty payable per ton, whether fixed or on a sliding scale, for these six years would be about 6·77d. If taken only for the last year it would be 9·25d. Both these figures are gross, and before deducting Excess Mineral Rights Duty, Mineral Rights Duty, Income Tax or Super Tax. If all these were deducted the 9·25d. would be reduced to 3·4d.

V. As Witness has only been in possession of the Estates for less than a year, this question if dealt with literally would only apply to a broken period of a year. The Witness has, therefore, had a return made for the last six years, 1913-1918 inclusive, in order to arrive at the average annual income of his predecessor and himself from mineral royalties and wayleaves. After providing for Excess Mineral Rights Duty, but not Mineral Rights Duty, Income Tax or Super Tax, this shows an average annual sum of £69,194 7s. 8d.

If the latter duties were deducted, the average annual income over the whole period would approximately be £55,391. Taken only for the last year, the following figures show the approximate results:—

	£
Gross Income	82,450
Excess Mineral Rights Duty	16,407
	66,043
Income Tax	} 42,153
Mineral Rights Duty	
Super Tax	
	£23,890

VI. Witness has assumed that what is meant by this question is how the property was originally acquired by himself or some member of his family.

The following classifications will give the main particulars required, but it must not be taken as exhaustive:—

- (a) Grants from the Crown.
- (b) Re-grants from the Crown either with or without Parliament's sanction.
- (c) Purchases.
- (d) Settlements on marriage.
- (e) Escheat.
- (f) Exchange.

As an example of (a) Witness will mention the Warkworth Estate.

As an example of (b) he will mention re-grants of 1414 and 1461.

As an example of (c) Alnwick in 1309 and Redesdale in 1750, besides a very large number from that date. Over £1,100,000 has been so invested in the last 100 years.

As an example of (d) Prudhoe.

As an example of (e) Lucker in 1365.

And as an example of (f) Shilbottle in 1395."

15,034. *Mr. Robert Smillie*: I think this Commission is primarily concerned with regard to whether or not it is possible for any individual to own land under the law of England. Several authorities have been quoted who state that private ownership of land is against the principle of the law of England. Do you know whether that is so?—No, I do not. That is a question which only an expert property lawyer can possibly answer. I should suggest, if you wish to get at the truth of all these titles to land, that you should call for an expert lawyer to attend and ask him that question.

15,035. That is the question as to whether or not it is against the principles of the law of England for a private person to own land?—I believe it is not contrary to the principles.

15,036. You do not agree with the authorities which have been quoted here?—I do not say that. I do not know the interpretation of those authorities. I cannot interpret the law; I am not an expert.

15,037. It has been laid down by experts that private ownership of land in this country is impossible as against the law.—I am afraid I know as little about law as you do.

15,038. If that is so, you are ignorant of the law. I know nothing about it?—I am.

15,039. (A) is: "Grants from the Crown." Do you know whether or not the Crown held the land of England on behalf of the nation and not in their own personal right?—I am only giving you my opinion; it is not worth much, because my opinion of law is worth nothing. I believe the Crown held it in its own personal right.

15,040. You believe the land of England belongs to the ruling King for the time being?—Yes, I believe so.

15,041. And he has a right to grant that land to any individual subject?—I believe so.

15,042. That is your opinion?—That is my opinion.

15,043. Would it be possible for you to put in—not here to-day—but to send for examination your charters; that is to say, the Crown grants or the titles which give you the Crown grants?—I think it would, certainly.

15,044. Are the grants from the Crown extensive; I mean extensive as compared with the total acreage you own, 224,500 acres, almost a quarter of a million acres?—Yes, they are. I could not say exactly what proportion, but they are extensive, certainly; only I should add, perhaps, to that, that in a great many cases these lands which were originally granted by the Crown were forfeited and have been regranted and in some cases purchased. In many cases where these lands were originally granted they have been subsequently purchased back.

15,045. They have been lost and repurchased?—Yes, and sometimes regranted.

15,046. In a case of repurchase, I suppose the persons who sold would produce a short title to show they were entitled to sell?—Yes.

15,047. You think so?—Yes.

15,048. The title would be in the repurchase agreement?—I think so.

15,049. Are you aware that grants given by the King of land to subjects away back in the early periods when those grants were given to your ancestors carried with them the responsibility of providing soldiers for the defence of the country?—I think not in all cases; in some cases they did.

15,050. If that is so, it would be stipulated in the charter or title?—Sometimes it is.

15,051. If a Crown grant was made it would be understood that the receiver of that Crown grant would be bound to provide soldiers, or else it would be stipulated otherwise?—That is certainly the case in some of the earlier grants; but a very considerable part of my property was regranted finally by Phillip and Mary about 1554. I do not think that any conditions such as that were anywhere inserted, and that grant was confirmed by Act of Parliament.

15,052. Are you aware it was an Act of George II. that took the responsibility of providing soldiers off the holders of land?—I think I have heard that.

Mr. R. W. Cooper: Do you not mean Charles II.? If you have Williams on Real Property before you,

5 May, 1919.]

ALAN IAN PERCY, DUKE OF NORTHUMBERLAND.

[Continued.]

you had better look at page 26. You may take it from me it was Charles II.

Mr. Robert Smillie: My information is it was George II, Chapter 50, which freed the lands of the burden of military service.

Mr. R. W. Cooper: No, it was Charles II.

Mr. Robert Smillie: Then I am wrongly informed on that point.

15,053. It was presumed that the holders of land had the burden and responsibility of providing an army for the defence of the country and the King. Do you know whether or not that Barons who held land by grant from the Crown, on an understanding that they would raise an army, granted, in turn, charters to the owners?—Yes, I suppose they did. I do not know really; I have not studied this subject; I do not deny it; it may be so; I expect it is so.

15,054. I suppose as part of the bargain the yeomen would hold themselves in readiness with their families to form the army when called upon to do so?—I should imagine so.

15,055. In return they held land from the Baron. Are you aware that the Barons confiscated the yeomen's land after they had been freed from military service and made them pay a rent in future for it?—I am not aware of that; I doubt that very much.

15,056. You do not know in the history of your own estate that that took place?—No, I do not.

15,057. You do not work any collieries yourself at the present time?—No.

15,058. Do you know very much about the conditions of the miners employed at the collieries on the estate who are working the minerals?—A certain amount. I meet a good many miners in the course of my daily life.

15,059. Do you know it has been alleged that in a good many cases on your estate the housing condition is very bad—there are back-to-back houses which are very bad?—What do you call my estate? Do you refer to houses for which I am responsible or for which the colliery owners are responsible?

15,060. I am not referring to houses at the moment for which you are held responsible?—I am aware it was stated, and in some cases possibly truly, that the houses for which the colliery owners are responsible were not as good as they ought to be.

15,061. The colliery owners lease from you?—Yes.

15,062. And have the right from you to work the minerals?—Yes.

15,063. You think, whether legally responsible or not, as a citizen and holder of the land you would be entitled to take a deep interest in a matter of that kind?—I do take an interest in it.

15,064. Have you done anything at all to secure that the mine owners who work the minerals would improve the housing conditions of the miners who produce the minerals?—I insert in every lease that the colliery owner is bound to keep the houses in a proper state of repair, and any new cottages they may build shall be submitted to me for approval.

15,065. Do you know whether that has been carried out?—It has been carried out.

15,066. It has been carried out?—One moment. You are asking me to say whether the colliery owners do always keep the houses in a proper state of repair?

15,067. You cannot possibly apply your attention to these things. I wondered if your agents took care to see if what was stipulated in the lease was carried out with regard to workmen's houses; do you know if they take an active part?—It is for the local authority to give notice to the colliery owners if the cottages are not in a proper state of repair.

15,068. Is it not a fact you have a clause in your leases which makes it imperative that the colliery owners must build proper cottages and keep them in order?—I have said so; there is a clause in the lease.

15,069. Is it for the Local Authority or your agents to make sure that the terms of your own lease are carried out?—I do not think it is the business of my agents. I think the colliery owners ought to see to it and the Local Authority ought to see to it.

15,070. The colliery owners would see they carried out their share of the bargain, but suppose the colliery owners neglected to pay you the royalty rent

stipulated in your lease would you leave it to the Local Authority to decide whether they should pay it or not?—No, certainly not.

15,071. Certainly your agents would make sure your lessee paid the royalty rent?—Certainly.

15,072. I put it now as man to man: Is it not of far more importance that you should look after the carrying out of that part of the lease which says the people who produce your wealth at the risk of their lives should be well housed rather than the carrying out of the portion that gives you the royalty rents?—I think the conditions I insert in my lease are all I ought to see to.

15,073. And you ought not to see those conditions are carried out?—No.

15,074. You are not prepared to undertake any responsibility for the state of the miners who produce the coal?—I have told you the extent of the responsibility I ought to undertake, and I do undertake that.

15,075. That clause in your lease might not be carried out. Is it not for yourself or your agents to make sure it is carried out?—It is impossible for my agents to get all round the colliery districts and supervise the cottages which the colliery owners ought to maintain in a proper state of repair.

15,076. I must say you must be very proud of the great effort made in Durham and Northumberland among the mining community to swell the ranks of His Majesty's Forces at the beginning of this war?—Yes.

15,077. Justly proud of it?—Yes.

15,078. I understand the Northumberland Fusiliers raised an enormous number of men?—Yes.

15,079. Many of the miners?—Yes.

15,080. A great many of them have made the great sacrifice?—Yes.

15,081. Would it not be your desire that those men who are spared to return should return to decent houses after having defended their country?—Certainly.

15,082. Do you still say you do not feel you have not any personal responsibility for seeing to it?—I have told you I do, and I insert in my leases those conditions.

15,083. *Mr. Frank Hodges:* I gather from your *précis* that you are one of the largest mineral owners in the country?—Possibly, I do not know.

15,084. Have you ever made a comparison?—No, never.

15,085. The acreage of the proved mineral rents is approximately 244,500 acres. Have you any acreage where mineral property has not been proved?—Not so far as I am aware, no.

15,086. Am I right in saying the whole of your property includes minerals?—I do not quite understand what you mean. You mean there are minerals under the whole of the 160,000 acres? I do not say that—I do not know quite what you mean.

15,087. I want to know whether you have any other property in addition to the 244,000 acres mentioned here, where the presence of minerals is suspected by your mining engineers?—No, that is the total property I possess.

15,088. You derive the gross income of £82,450 from that?—Yes.

15,089. Roughly speaking, then, you only attain a net profit of a quarter of that amount if your total is correct?—That is right, from the mineral property—the mineral royalties.

15,090. I am confining myself to that. Out of a gross income of £82,000 you have a net income, roughly, of £24,000?—Yes.

15,091. So that under taxation the State has gradually expropriated your rights to the extent of three-fourths of the monetary mineral value?—I do not think that is a correct way to state it. The State has taxed me so much on the amount, about three-fourths. I do not think that amounts to expropriation.

15,092. It does not in fact?—It is not the correct term, I think.

15,093. It has taken three-fourths of the monetary value of those minerals from you year by year?—It has not year by year; only for the last year it has taken that proportion.

8 May, 1919.]

ALAN IAN PERCY, DUKE OF NORTHUMBERLAND.

[Continued.]

15,094. It took a less proportion before. Some of this is new taxation. Did you raise any objection to the imposition of these taxes?—No, not that I am aware of—I certainly did not.

15,095. Do you think it was just taxation?—In time of war, yes.

15,096. It is not war now; it is peace?—Peace has not been signed yet.

15,097. Do you contemplate raising any opposition to the taxation when peace is formally signed?—I should think it is very likely.

15,098. You will raise objection?—I do not say I shall; I do not know; I will consider it.

15,099. You think you are not having enough of the £82,000?—It seems rather a small proportion, do not you think so?

15,100. By comparison, you mean?—Yes, everything is relative.

15,101. Yes, of course, in this world; we do not know about the next. With regard to the movement of nationalisation which is to take the remaining one-fourth that you have, do you think you could successfully raise opposition to Parliament taking legislative measures to take that one-fourth?—I hope so; I shall do my utmost.

15,102. How would you influence Parliament not to take that quarter?—Well, I should do my utmost in the House of Lords and in trying to organise opposition in the country to any scheme of nationalisation.

15,103. Would you do more than the ordinary enfranchised citizen? Would you do more than cast your vote against a candidate who was proposing to take the other quarter from you?—I should certainly do more than cast my vote; I should speak and use any effort I could possibly make in order to prevent it.

15,104. That is to say, in the House of Lords you would oppose any such measure?—Certainly, and in the country, too.

15,105. Would you oppose with equal force further nationalisation?—Certainly. I thought you were including the two things.

15,106. No.—I should oppose both; with regard to the latter with even more—

15,107. More deadly opposition, I suppose?—Certainly.

15,108. Why would you oppose nationalisation with such deadliness?—There are several reasons.

15,109. Give me one?—The main reason is this: the Miners' Federation do not want it.

15,110. Do not want what?—Do not want it.

15,111. And because the Miners' Federation do not want it, that is one of the reasons why you oppose it?—I did not say that.

15,112. I asked you for a reason why you were going to oppose with such deadliness nationalisation, and you say because the Miners' Federation do not want it?—I mean to say they are only going in for this scheme of nationalisation as a step to something far more drastic and for measures more revolutionary.

15,113. What is that?—Confiscation of all land. I think—I do not know, it is only an expression of opinion—that probably the control of all the resources of production of all the industries in the country; I think—it is only an expression of opinion—that they want the complete control of the coal industry for themselves. I do not think the State is going to have much control in the matter.

15,114. Therefore it is out of regard for the national interests that you oppose nationalisation?—Certainly.

15,115. You do not think the Miners' Federation has any scientific reason for asking that the mineral properties in the country shall be nationalised?—I do not know what you mean by "scientific."

15,116. I will explain if you do not know what the word means. You do not think the Miners' Federation have any ideas that the properties ought to be worked on a more up-to-date and approved plan?—I daresay they do; I do not deny that.

15,117. If they had that idea, do you think they would be justified in putting it forward?—Certainly, they can put forward any scheme they like.

15,118. Would it bear any relation to the confiscation of land if it were put forward for that purpose?—That depends upon whether they are going to confiscate land or not.

15,119. Who told you they were? The Miners' Federation, I imagine, has a sufficiently large job to get mineral nationalisation, do not you think, if you are going to oppose it with such deadliness?—I see Mr. Smillie, in addressing an audience on Sunday, May 4th, is reported to have said, I do not know if he actually said it, that he was not out for 15,000 acres of land for the co-operative movement; he was out for the whole of the land of the country. In a question to the previous witness before me he said he was out for the confiscation, or nationalisation, I think he put in, but he used the word confiscation.

15,120. Mr. Robert Smillie: Of mineral royalties.—I thought you said land.

15,121. I am out for the taking of the land?—A most interesting admission.

15,122. Mr. Herbert Smith: Do you say you will oppose any such question as nationalisation in the House of Lords?—Certainly.

15,123. You are doing exactly what the report says we should do if we nationalised, use our influence in the House of Commons?—You are using your influence in the House of Lords.

15,124. The position is this; that there is no election for you to the House of Lords?—No.

15,125. You are there by hereditary procedure?—Some people; others get appointed.

15,126. You are one that has gone through lightly?—Yes.

15,127. We have to get elected?—Yes.

15,128. Other people are saying that we should use our political endeavours to get our ends met in the House of Commons?—Yes.

15,129. That would be exactly what you do in the House of Lords?—Use our influence against legislation that we thought was bad for the country.

15,130. Yes?—Certainly.

15,131. Even if the Commission recommended nationalisation you would use your influence in the House of Lords to defeat it?—Certainly. What has the Commission to do with me?

15,132. As a matter of fact, the House of Lords has never passed a reform freely?—It is a matter of opinion; I do not agree with you there.

15,133. Any reform they have voted for that has been brought about by the conditions in the House of Lords I have been trying to seek?—There have been many.

15,134. Tell me one?—I really cannot tell you at this moment. You seem to be getting off the point a little.

15,135. Why are you opposed to nationalisation?—I have told you the reason.

15,136. Why?—Because I think it is only a blind, or, perhaps it would be more correct to say, only a step to something very much more drastic and revolutionary; it is a step towards the confiscation of other forms of property, and I do not believe the State will have any control at all, really.

15,137. Do you not go further and say we wanted it for our own ends?—I suppose you do want it for your own ends.

15,138. To control it as we think fit?—I know you always object to a monopoly. It seems to me in this case the Miners' Federation are trying to get a monopoly of the coal for themselves.

15,139. Will you give an instance where the Miners' Federation said they wanted the sole control of the trade for their own ends?—No, they would not say that, would they? That would be giving the whole show away.

15,140. Why should you imply a statement like that to the Miners' Federation if you have no authority for it?—I did not say I could prove it. You asked for an expression of opinion, and I am giving you an expression of my opinion. I judge by various evidence which has been given before this Commission, by various speeches which I have read; and, if you ask me to mention one, there are some very interesting remarks made by Mr. Straker. I

8 May, 1919.]

ALAN IAN PERCY, DUKE OF NORTHUMBERLAND.

[Continued.]

do not know if he speaks with the authority of the Miners' Federation on this subject: "Nationalisation," says Mr. Straker, "with bureaucratic administration will not prevent labour unrest." He does not seem to like bureaucratic administration. I do not know where the State is coming in. He proposes to have mining councils on which the miners are always to be predominant.

15,141. He does not say that?—No, it is very clever.

15,142. If you read Mr. Straker, read Mr. Straker, and do not put in what you think?—I am giving you an expression of my opinion.

15,143. Do not misquote Mr. Straker?—I am not misquoting.

15,144. I say Mr. Straker has not said anything of the sort or made any statement such as you are quoting?—I say he did.

15,145. Then read it?—I am not giving you the exact words. I am giving you the words I have taken down from his evidence.

15,146. Is that fair?—I will send you his evidence.

15,147. We have his evidence here where he asked for joint control. Is that asking for the Miners' Federation?—He calls it joint control—that is what it means.

15,148. The Miners' Federation are not asking for nationalisation of the mines for their own benefit. If you will take it from me they are asking it for the benefit of the community and not individual private enterprise. Your money is being made at the expense of poor people in this country?—That is a matter of opinion.

15,149. Is Bearpark Colliery Company in your premises?—I do not think so; I do not remember that name.

Mr. R. W. Cooper: That colliery is near the City of Durham. It is not on the Duke's property at all.

15,150. Mr. Herbert Smith: For six years up to 1915, and I am leaving out during the war, they declared a dividend of 17 per cent.?—I daresay they did.

15,151. You think that is justified?—I did not say so. It is no use giving me an isolated case like that.

15,152. The Miners' Federation do not think it is justified. They do not want to work for profit. They want people to have the coal at the lowest possible cost taking you out of it. We say you are getting what you are not justified in getting. Is the Belkow Vaughan on your estate?—No.

15,153. Mr. R. W. Cooper: It is a long way from the Duke's property. It is in the south-west of Durham, near Bishop Auckland.

15,154. Mr. Herbert Smith: Is the Harden Colliery on your estate?—No.

15,155. Is the Pease and Partners Colliery on your estate?—No.

15,156. All these are colliery companies averaging, roughly, any way from 14 per cent. to 20 per cent., and the miners are living in hovels like they are on your estate and on other estates in Durham and Northumberland?—That is an assertion which is not true. The miners on my estate are not living in hovels.

15,157. Do you deny the death-rate in Durham and Northumberland?—I do not know anything about the death-rate.

15,158. You have read Mr. Smillie's speech and misread Mr. Straker?—I did not read this particular thing about the death-rate.

15,159. Do you know it is about the highest death-rate we have in Durham and Northumberland amongst infants?—It may be.

15,160. Is it not worth your while to see how these people live, to see what causes these deaths?—You think landowners have nothing to do but examine statistics. I am a hard-worked man. I am not a privileged man like you. I cannot afford to waste time sitting upon a Commission like this.

15,161. I think you do nothing at all?—That is where you are wrong.

15,162. The workmen go down, and there are 177,000 accidents, and there are about 1,500 killed a year to let you live in luxury; that is what I think?—I dare say you do, but that is wrong.

15,163. If you will read some of my speeches you will see I said that?—I am sorry, but I really cannot.

15,164. With regard to the clause in your agreement, which you say there is, that the houses must be kept in good repair, how long have you been carrying out this agreement? Was this agreement in before you took possession?—Certainly.

15,165. Have you been round to see if they are kept in a proper state of repair?—No, I have not had the chance yet; I have been too hard-worked.

15,166. I suggest you would go round and see what form your hunters wore in if you kept hunters?—I do not keep hunters.

15,167. Or your motor-car, to see what condition it was in; but you do not think it is so useful as to the workmen earning your living to go and see what condition they live in?—I do not follow your train of reasoning.

15,168. Have you built any new houses in your time of occupation?—Seeing that I succeeded less than twelve months ago, and, as you know, no houses have been built in that time, I do not see how I could.

15,169. You took the estate as you found it and nothing done?—What do you mean, "nothing done"?

15,170. Improving the miners' houses?—The miners are not the only people in the world. I have a lot of other people to look after besides miners.

15,171. You specially tax the miners' industry, a tax on something you never paid for—coal?—That is the way you put it. That is an appeal to ignorance and prejudice.

15,172. Is that a question of ignorance and prejudice? Do not you think you are equally prejudiced?—I do not think so; I may be.

15,173. Do you not think you might be as equally ignorant as I am?—I am not accusing you of ignorance.

15,174. You are putting it so?—I say you are making an appeal to ignorance and prejudice. I did not say you are ignorant and prejudiced.

15,175. I make this statement on behalf of humanity?—I do not agree with you; I do not think you are.

15,176. Mr. R. W. Cooper: You have been asked some questions about the County of Durham. Have you any property in the County of Durham?—No, none at all; all my mineral property is in Northumberland.

15,177. With regard to your mining leases in Northumberland, you have upon your staff, I assume, a highly skilled mining engineer?—Certainly.

15,178. To advise you?—Yes, certainly.

15,179. He, of course, is responsible jointly with your solicitor for the insertion in your mining leases of all the conditions usual in the district?—Yes.

15,180. I hardly like to ask you the question, but to everybody who lives in the North is it well known that you have taken an active part in public affairs both in Newcastle and Northumberland?—I have done my best.

15,181. Sir L. Chiozza Money: I understand you come here very frankly to defend your interests?—Certainly.

15,182. Would you kindly tell us what particular service it is you perform to the community qua coal owner?—I really do not quite know what you mean, qua coal owner.

15,183. Exactly what I say?—I do not know what you mean.

15,184. As a coal owner what service do you perform to the community?—As the owner of the coal I do not think I perform any service to the community—not as the owner of the coal.

15,185. I see. As the manager of the leases what service do you perform?—I look after my property to the best of my ability. I do not know if you call that a service or not.

15,186. Do you have anybody to help you do that?—Certainly, a lot of people.

15,187. Will you tell me how many people are engaged by you to look after your property?—I cannot tell you offhand.

15,188. It is interesting. There are so many officials concerned in the efficient management that you

8 May, 1919.]

ALAN IAN PERCY, DUKE OF NORTHUMBERLAND.

[Continued.]

cannot tell me how many officials you employ to manage your mines both from a legal point of view and a technical point of view?—I have a solicitor, a mineral agent, and estate agents. There are two estate agents who have more or less to do with it.

15,189. At these various estates to look after these matters for you?—Certainly.

15,190. I may take it really that the personal service you perform in this connection is very slight?—The service which a land owner performs on a large estate is in generally managing the whole estate. He does not attend to the little details of the fixing of the rents. He leaves that to his officials. He has general control over the policy, and all questions of policy are brought to him.

15,191. If I were a capitalist and came and said I wanted to bore for coal or lease the coal area would you do the work yourself?—No.

15,192. Would you refer me to someone?—Certainly.

15,193. That is what I thought. Then I ask you again what particular service it is you perform to the State which enables you to draw this £82,000 gross and £24,000 net from the work of the community?—The fact that I own the minerals.

15,194. Tell me quite literally what it is you own?—I have told you what I own. I own about 160,000 acres of surface land and minerals plus 70,000 acres of minerals.

15,195. Is it your theory you own everything underneath those acres?—All except in the case of about 500 acres where I own the surface and not the minerals.

15,196. If science made it possible to-morrow to mine to 20,000 feet you would still own what was found?—Certainly.

15,197. Even if it went to the centre of the earth?—I understand that is the law. That is a legal point.

15,198. Do you think that is a good law?—Few things in this world are ideal. I think it works all right.

15,199. Do you think it is good law?—I think under the conditions in which we live in the world it is the best law to meet those conditions.

15,200. Do you think it is good law?—Considering all things as they are, I say I think the practice as it is works well.

15,201. Do you realise that the output from your mines is about equal to the entire output of the rather important Dominion of New Zealand?—No, I did not—it may be.

15,202. I think you told us—do not think I blame you for saying so—you consider you are doing your duty in the estate to which God has called you?—I would not like to say that. I am doing my best—I hope I am.

15,203. Is it not conceivable that one of your successors might be a rather irresponsible person who did not do his duty as well as you do?—Everything is possible in this world.

15,204. Do you think it is good for the nation that the properties should come into the possession of a man who is irresponsible?—I do not think he could do any harm.

15,205. I thought you said you object to the miners having a monopoly of coal, is that so?—I object to anybody having a monopoly of anything.

15,206. Did you not give it as your chief reason in opposing nationalisation that you objected to the miners having a monopoly of coal?—Yes.

15,207. And all they say is a blind—that is what they are really aiming at?—Yes.

15,208. You think it is a bad thing for 1,100,000 miners and their children, representing one-tenth of the population of this country, to have the monopoly of coal?—You have to assume they want these things.

15,209. I do not assume. You say you think it is a bad thing for the miners to have such a monopoly. So convinced were you of that, that that was your chief reason for opposing nationalisation?—Yes.

15,210. You are going to use your power and influence to fight in that place over there against it?—Yes.

15,211. You think it is a bad thing for the one-tenth of the population of the whole of the country if they want it?—Yes.

15,212. Then do you not think it is a bad thing for a man to own as much as you do?—No, I think it is an excellent thing in every way.

15,213. Is it not possible, under the system which you think good, for a few thousand people who own the coal of this country to hold it up under the law?—It may be under the law. As a matter of fact, it never happens. If they are allowed to do it by the law, why do you not change the law?

15,214. You are one of the reasons why we cannot change the law?—Not at all. I should be delighted to change the law.

15,215. Have not these few thousand people the power to hold up the coal in this country and abuse it?—As a matter of fact, they do not exercise their power, and if they did exercise the power it would be perfectly possible to pass legislation to stop it. That is obviously a manufactured grievance.

15,216. Is it not the fact in the past it has been grossly abused?—No, I do not think it has. I read the evidence given in the 1893 Commission, on which working miners were represented, and they said it had not been abused. I think they are right.

15,217. Have you looked at the thing from a scientific point of view?—It depends upon what you mean by a scientific point of view.

15,218. From the geological point of view?—Yes, I have considered geology in connection with coal; one is bound to.

15,219. Do you not know it is the opinion of geologists that an enormous amount of coal has been wasted?—It may be the opinion of some geologists.

15,220. Is it not the opinion of them all?—I do not know. You assert it. I do not know. It may be.

15,221. To come to the present. Are you aware that a member of this Commission has signed a report in which no less than 14 categories of disabilities under the existing system are named?—I did not know it.

15,222. Do you know that these 14 categories of disabilities have so struck this Committee that they present in 16 paragraphs a method of dealing with them?—What is that?

15,223. The interim report of the Acquisition of Land Committee for the acquisition for public purposes of rights and powers in connection with mines and minerals. The Chairman was Mr. Leslie Scott, K.C., M.P.?—I know.

Mr. Arthur Balfour: That document has not been published.

Chairman: The only question asked his Grace is whether he knows. He has not seen it.

Sir L. Chiozza Money: I think I am entitled to ask him if he has seen it.

Chairman: We shall not report this century if we go on like this. The witness says he does not know and has not seen it. You need not discuss the matter further.

Witness: I should not like there to be a misunderstanding. I have seen that report.

15,224. *Sir L. Chiozza Money*: Then it seems rather a pity the interruption was made. You have seen the report?—Yes.

15,225. Have you read it?—Not carefully. I did glance through it.

15,226. Did you see there were 16 paragraphs of recommendations to deal with 14 categories?—Did they not recommend to set up tribunals to deal with these difficulties?

15,227. Did it not advise there should be a strong advisory council?—Yes.

15,228. And a local sub-committee reporting to it?—I daresay.

15,229. Do not you think the mining industry is of such a size that it would be necessary for those bodies to be in general session to deal with the questions that would arise?—I do not know.

15,230. Do not you think they would require a large number of officials to deal with the matters?—Perhaps.

15,231. Are you aware they point out there is no organisation for the experimenting and testing of undeveloped fields?—I will take your word for it.

15,232. You have read the report?—Yes.

8 May, 1919.]

ALAN IAN PERCY, DUKE OF NORTHUMBERLAND.

[Continued.]

15,233. Do you think it right that a large sum of public money should be spent in boring for more coal, so that when the coal is found and worked there should be fresh royalties for the owners?—Why not? The State is collaring much more than half of the interests they get.

15,234. It is not a question of collaring. Do you think the State ought to provide public money to provide more income for the landlords of this country?—That is a ridiculous way to put it, I think. The State does the boring, it develops the industry, and gets money for itself.

15,235. Would it not put unearned increment into the pockets of the landlords?—A very good thing for the landowner.

15,236. Do you think it perfectly just and right?—Perfectly just.

15,237. Supposing it cost £250,000 within a few years, do you think it right that money should be spent to provide fresh incomes for landowners?—I do

not agree with that way of putting it. The landowners would benefit, the rest of the community would benefit, and the Government would benefit, too.

15,238. You think it would be right that public money should be spent to provide this fresh income?—I say that is not the way to put it. If you put it my way I do agree.

15,239. Have you any serious objection to nationalisation besides the one you gave, the projected monopoly of the Miners' Federation?—I have. I would rather not say it; it might give offence to one member of this Commission.

15,240. I will not press it?—I am quite willing to give it.

15,241. I do not think anybody on this Commission is so thin-skinned as to mind?—As the result of reading Mr. Sidney Webb's evidence I came to the conclusion nationalisation would be absolutely disastrous to the interests of this country.

(The Witness withdrew.)

CHARLES STEWART HENRY VANE-TEMPEST STEWART, 15,242. *Chairman:*

“PRECIS OF EVIDENCE BY CHARLES STEWART HENRY VANE-TEMPEST STEWART, 7TH MARQUIS OF LONDONDERRY.

I am the owner of minerals already proved to exist under about 5,808 acres in the County of Durham.

I also carry on business as a colliery owner in that County, being the owner of three collieries situated near Seaham Harbour called Dawdon Colliery, Seaham Colliery and Silksworth Colliery.

The Dawdon and Seaham Collieries are upon my own freehold estate of Seaham.

The Silksworth Colliery is held by me under lease from other owners together with the coal mines which are worked to that colliery.

I carry on my business as The Londonderry Collieries, Ltd., all the shares in that company (except four of £100 each) belonging to me. As between that company and my estate the coal mines are let to the company, the amount of the rents, which average 4½d. per ton, being credited and paid to me by the company.

One of the pits at Seaham Colliery was formerly called Seaton Colliery and was sunk by a company of that name and afterwards purchased by my great-grandmother, Frances Anne Marchioness of Londonderry, who sank a second pit in 1849.

Silksworth Colliery was sunk by my grandfather, the 5th Marquis of Londonderry, in 1872.

Dawdon Colliery was sunk by my father between 1900 and 1906. The sinking and completion of this colliery occupied about six years. Great difficulty was experienced in sinking the pits through the strata owing to the enormous quantities of water met with, and the system of freezing the strata by chemical means had to be adopted to enable the shafts to be sunk. There is attached to Dawdon Colliery a large area of submarine coal which is held by me as a lessee of the Crown upon which I pay a tonnage rent of 4½d. per ton.

The whole of the coal at Silksworth Colliery is held under lease and is sublet at varying tonnage rents.

The number of men and boys employed at each of these collieries is as follows:—

Seaham	2,850
Silksworth	2,250
Dawdon	1,900

or a total of 7,000 men and boys.

The town and harbour of Seaham Harbour were established by my great-grandmother, Frances Anne Marchioness of Londonderry, and the coals worked by my collieries are shipped either at Seaham Harbour or at Sunderland, there being direct railway communication with both of these ports, the railway communication between Seaham and Sunderland, which was formerly the Londonderry Railway, having been constructed by Frances Anne Marchioness of Londonderry.

Marquis of Londonderry, Sworn and Examined.

Seaham Harbour Dock was originally constructed by Frances Anne Marchioness of Londonderry and is now the property of the Seaham Harbour Dock Company, of which I am Chairman and in which I am a large shareholder.

I and my ancestors have been colliery owners in the County of Durham for more than 100 years.

At one period my predecessors held collieries in other parts of the County of Durham, but those collieries were either sold or given up and are now worked by others.

The following are the answers to the questions put to me in the letter of the Secretary of the Coal Industry Commission of the 30th April:—

1. The total acreage of land in the County of Durham belonging to me under which coal has been proved to exist is 5,808 acres. The coal in the upper seams under 834 acres of this area is, I believe, exhausted. The coal in the remaining seams under these 834 acres has been proved by boring made from the bottom of the shaft from which the upper seams have been worked, but none of such coal is at present let.
2. The total output of coal from all the freehold properties belonging to me in the years 1913 to 1918 inclusive was 3,280,321 tons, of which 1,569,296 tons were worked by the Londonderry Collieries, Limited, leaving a balance of 1,711,025 tons worked by other lessees.
3. The average annual output during this period of six years was 546,720 tons, of which 261,549 tons were worked by the Londonderry Collieries, Limited, and the balance of 285,171 tons were worked by other lessees.
4. The royalties payable to me are fixed tonnage royalties. They vary slightly with the different coal seams, the average highest of any one mining property being 5½d. per ton, and the lowest 3½d. per ton. Of the total average annual output of 546,720 tons 378,124 tons are worked at an average of about 4½d. per ton.
5. The average annual income received by my late father and myself from mineral royalties and wayleaves during the six years referred to was as follows:—

	£
Mineral royalties	9,608
Underground shaft and surface mining wayleaves	5,076
Independent surface wayleaves	650

Of the mineral royalties £4,364 represented the tonnage rates charged in respect of my own coal at Seaham worked by the Londonderry Collieries, Ltd. Of the

8 May, 1919.] CHARLES STEWART HENRY VANE-TEMPEST STEWART, MARQUIS OF LONDONDERRY. [Continued.

underground shaft and mining wayleaves £4,867 represented the rent charged in respect of the carriage of coal belonging to the Crown and other parties carried through my freehold property and up my freehold shafts.

The independent surface wayleaves are charged in respect of a railway used by another colliery company, the South Hetton Colliery Company, on my Seaham Estate for a distance of about $1\frac{1}{2}$ miles and the rent covers the right to convey 500,000 tons of coal and represents a charge of $\cdot 32d.$ per ton.

6. As regards the nature of the root of my title I have in consequence of the request of the Commission had my title deeds examined,

except as regards the title deeds relating to the 834 acres of land situate near the City of Durham, forming two properties called Old Durham and The Grange, under which as I have explained the coal in the upper seams is exhausted and which belonged to my ancestor John Tempest. The result of this examination is that I find that all my properties were acquired by purchase and that the minerals are expressly included in the Conveyances:—

The following statement gives:—

- (a) The name of each property.
- (b) Its estimated surface area.
- (c) The name of the vendor.
- (d) The name of the purchaser.
- (e) The date of the purchase.

Name of Property.	Surface Area.	Name of Vendor.	Name of Purchaser.	Date of Purchase.
	Acres.

I am opposed to the nationalisation of Coal Mines.

I do not believe that my collieries will be carried on more efficiently or that the conditions of the workmen will be better under State ownership than they have been whilst the collieries have been worked by myself and my ancestors.

I am the Chairman of the Londonderry Collieries, Ltd., and I have no desire to sever my association with my colliery property in which I wish to take a personal interest.

My father died in February, 1915, and owing to the War and to my military service in France, I have not been able to take the close interest in my business which I otherwise would have done; but as soon as my duties as a member of the Air Ministry have terminated it is my intention to devote more of my time to my business and to my interests in the County of Durham, in which my principal English residence of Wynyard is situated."

15,243. *Mr. Frank Hodges:* Did you hear the evidence of the last witness?—Yes.

15,244. Do you hold the view that if this Commission reported in favour of the nationalisation of minerals, after having considered all the facts that could possibly be brought before this Commission, that you would oppose any legislation for the nationalisation of minerals?—Yes, I should certainly oppose legislation for the nationalisation of minerals. I take the report of a Commission as advising the community, myself included; no more than that.

15,245. You know the purpose for which this Commission was set up?—For ascertaining all the facts.

15,246. For ascertaining all the facts, therefore, if upon the facts so ascertained, they reported in favour of nationalisation, would it be a fair assumption that they would have been made cognisant of all the facts they could be made aware of?—No; I should say my opinion is as good as the individual members of the Commission.

15,247. If it were the decision of the Government to accept the report of the Commission, would you still use your influence in the House of Lords to turn down the decision of the Government?—Most certainly I should. The authority which affects me is the Houses of Parliament, not the Government.

15,248. If the Government proposed to put its decision into law, you would oppose it?—The Government would put its proposal into law by a vote of the Houses of Parliament.

15,249. Obviously?—I do not anticipate that.

15,250. Does your opposition proceed upon the assumption that you believe in the inalienability of the right of a property owner to his property?—The rights of nationalisation.

15,251. No; do you believe that whatever happens, whatever is suggested in law for a variation of the rights of the property owner, if it clashed with your interest, it would be your duty to oppose it?—I am not considering my own interest at all. I am opposed to nationalisation. I believe in the ownership of private property.

15,252. You believe more particularly in your holding your own property?—I believe in holding my own property like the coat on my back, or the coat on your back.

15,253. That is not your private property?—My coat is my private property and your coat is your private property. That is how I regard it. I may be wrong.

15,254. Your property consists, according to your theory, of so many acres of minerals?—Yes.

15,255. You have air over your property too, have you not?—Yes.

15,256. Do you say that the air over your property is yours?—That is being decided now. I have just come back from Paris where there is being discussed the question of air.

15,257. Were they discussing your air or somebody else's?—I am not at liberty really to divulge that report. I hope to do so at no distant date.

15,258. You say you own the minerals. Would you put forward the same proposition, if the air over your property had an economic value, that that belonged to you too?—I have not considered that point.

15,259. You have considered the other?—I have considered minerals, certainly, because the minerals have been purchased for that purpose. I think you will see in my statement I have tried to put it as plainly as I can.

15,260. I see in your statement certain moneys have been expended on transfers. You have put forward clearly, if I may say so, on page 3, and you have done more than any of the other previous witnesses have done—you have set forth the names of the vendors of each particular property. Suppose it could be proved to you that the holding of your property, whether it be in the air or under the grass, was not conducive to national interests, that it caused

8 May, 1919.] CHARLES STEWART HENRY VANE-TEMPEST STEWART, MARQUIS OF LONDONDERRY. [Continued.

a serious national disturbance, would you consider that that would warrant you in changing your view as to the rights of property?—I do not think it would matter what I considered. If the community became anarchic they would take everybody's property. If the majority of the community thought it was a good thing they would probably do it. I do not think that time will come.

15,261. Apart from the question of anarchy, supposing this Commission and the country generally came to the conclusion because of the private ownership in property the nation was not getting the best out of the property, would you still oppose any proposition for a change?—I would hold my own opinion. My opposition would not be very potent, I think.

15,262. It would not be very potent against the declared wishes of the community?—We have often seen that question brought forward before, and lots of things have been decided against the wishes of individuals. If they protest forcibly they are put in gaol, otherwise they give in.

15,263. With interest to the nation?—I do not think so. I do not think the individual prosperity is of any interest.

15,264. That is not my point?—Then I am afraid I do not follow you.

15,265. Have not individual interests been set aside by the nation in the past and such setting aside has proved to be a great benefit to the nation?—In what respect do you refer?

15,266. Take the war. Has not the fact that individual interests have been set aside compulsorily by legislation resulted in some good for the community at large?—In those particular circumstances it has. In a great many cases it has not.

15,267. In normal circumstances?—I am afraid I am an individualist, and I think that as soon as we get back to individuality the better for the country.

15,268. It pays you to be an individualist?—You may put it that way, certainly.

15,269. It is because the State would pay you less that you oppose this proposition?—The State pays me less do you say?

15,270. Yes?—The State pays me nothing. I pay the State a certain amount.

15,271. You do not consider the great national asset puts you in the same form of relation to the State?—I am prepared to go into that. The fact of my holding it is of far more benefit to the State than in any other circumstances.

15,272. Have you gone into that? Suppose it is proved scientifically that the way you hold your royalties has meant a profit to you, if you like, which the State ought to have had, would you be prepared to accept the scientific change?—You talk vaguely about it being a profit to me. Who is going to prove that?

15,273. This Commission may prove it?—That does not mean much to me. I think I have studied this question as much as the individual members of this Commission.

15,274. Mr. Arthur Balfour: Would you agree if it was proved, or decided rather, that nationalisation should take place that proper compensation should be paid?—Yes, most certainly.

15,275. And in arriving at such compensation it might be necessary to set up an impartial tribunal to consider the whole facts of the case before settling the exact compensation?—I take it that is what the practice would be.

15,276. No overhead compensation or general calculation would be possible?—I suppose not.

15,277. Each case would have to be considered upon its own merits?—Yes.

15,278. According to the length of the lease and the general details?—Yes.

15,279. Sir Arthur Duckham: These properties you have at Seaham and Dawdon you run yourself?—Yes.

15,280. Can you give us any idea of the profits you are making from these collieries?—I have not the figures with me.

15,281. Do you know what profits you make per ton?—It is not a high profit per ton. In Dawdon, which is the newest mine, the profit per ton is higher than in the others, which are old mines.

15,282. The old mines, I suppose, are old workings?—They are old workings.

15,283. You have not the figures before you?—I have not the figures before me at this moment.

(The Witness withdrew.)

(Adjourned for a short time.)

Dr. EDGAR LEIGH COLLIS, Sworn and Examined.

15,284. Chairman: This is a witness whose evidence is being interpolated, speaking as to the question of health in various Government employments. He says that his professional experience has been that he was in general practice from 1897 to 1908 in an industrial area. From 1908 to 1917 he was one of His Majesty's Inspectors of Factories, and from 1917 to 1919 he was a Director of Welfare and Health at the Ministry of Munitions. Dr. Collis has to go away either this morning or to-morrow, and, therefore, we are taking his evidence now so that he may be free. I will ask Mr. McNair to read his evidence.

The Secretary: "My experience of the mining industry is slight, and is confined to some knowledge of the miner's home conditions in North Worcestershire and South Staffordshire, and to the inspection of a few coal mines in Somerset, the Forest of Dean and South Lancashire, of ganister mines in Yorkshire and Scotland, of getting iron ore in Westmorland, lead ore in Cumberland, and tin ore in Cornwall. I hold the opinion that supervision of the health and safety of workers cannot be left entirely to the workers themselves, but must be undertaken for them, both for their immediate benefit and in the interests of industrial efficiency. No one is a good judge of his own health; and few persons, owing to innate conservatism, are prepared to press for conditions necessary to their safety and welfare; yet a contented and healthy worker is a more efficient industrial unit than a discontented and unhealthy one; and discontent and lack of health are frequently interdependent. Supervision, to be effective,

must be personal, and come directly in touch with the worker as an individual. For this reason the basis of industrial safety and health work must be local organisations in each establishment employing labour: these organisations should be part of the management of every industrial establishment. All establishments, however, do not have equally effective managements, and, even when the desire to be effective is present, knowledge of how to act may be lacking. Special advice, therefore, which can only be given by expert inspectors is required to stimulate those who are behindhand and to advise and to help those who are ready to act. The duty of making inspections and giving advice should not be under the control of those who are responsible for administrative and executive action. If it is, there is danger of criticism and advice being disregarded. The ideal combination would be an independent staff of trained experts visiting place after place, gathering information as they go, and advising willing managers how to improve conditions, this staff being able to carry out with the co-operation of managers and workers special investigations and being assisted by colleagues who devote their whole time to research work.

My experience as a factory inspector is that advice as to improving conditions of employment was more readily adopted in establishments under Government control, such as Woolwich Arsenal or the Admiralty Dockyards, than in the majority of privately owned factories and workshops. Government industrial establishments come under the Factory Acts and so

8 May, 1919.]

DR. EDGAR LEIGH COLLIS.

[Continued.]

are inspected; but, as no prosecutions can be instituted by one Government Department against another, attention was drawn to any infringement of the Acts by means of recommendations, which were accepted and acted upon. The standard of health and safety adopted was that laid down in the Factory Acts. In the case of privately-owned establishments, it was often necessary to prosecute before a magistrate in order to obtain compliance with the requirements of the Acts. In the Ministry of Munitions, the relation was close between the Welfare and Health Section and National Factories; but, still, inspection was kept entirely distinct from management. We found little difficulty in getting managers to accept our advice, and we obtained much valuable help and assistance from many of them in the initiation and development of our work. The standard adopted was not limited by the legal requirements of the Acts, but depended upon what experience had taught us to be advantageous for maintaining and increasing the output of munitions. Officers of the Welfare and Health Section visited not only National Factories, but also other places, *i.e.*, Controlled Establishments where munition workers were employed. I found during the war a greater inclination on the part of employers in these Controlled Establishments to adopt the advice given than I was accustomed to in pre-war days; and attributed this partially to the fact that the cost of structural alterations and the salaries of welfare superintendents, nurses, and medical officers could be charged in whole or in part against working expenses when calculating profits for Excess Profits Duty. Nevertheless, when points of difference arose as to the adoption of recommendations made, I found it easier to obtain the improvements desired in National Factories than in Controlled Establishments. A few special establishments, such as those of Bourneville, Port Sunlight and Rowntree's at York, had always in pre-war days been far ahead in health and safety matters of any Government factory, and the suggestion might be made that under Government control such initiative would be lost. "I have, however, always considered that Government factories were somewhat behind, because inspectors only insisted upon compliance with the minimum requirements of the Acts and asked for no higher standard. Certainly, I have found that when this minimum standard was deserted the managers of National Factories were some of our most enthusiastic supporters, and that they showed great initiative and individuality in developing schemes of health and safety.

15,285. *Mr. Frank Hodges*: I should like to ask you whether you have considered any scheme that might be applicable to coal mines, in dealing with health and the general welfare of the workmen?—I cannot say that I have.

15,286. Do you think such a scheme could be brought into being?—Yes, I think one could.

15,287. You are aware I feel sure that there are a large number of miners who from year to year suffer from what is known as miners' nystagmus?—I am aware of that.

15,288. It renders them in many cases unfit to continue their work in the mine?—Yes.

15,289. Would you suggest that some useful purpose might be served if a scheme were developed by which lads entering into a mine might periodically have their eyes examined to see whether they were fit subjects to work in a mine?—In those mines where the disease is prevalent I think that would be advantageous.

15,290. Would you suggest that periodically after the first examination such lads and youths should be subject to examination with a view to seeing in their earlier life whether some other occupation might not be more useful to them than mining?—Yes, if the disease cannot be eliminated from the mining industry.

15,291. You are aware I believe that once a man has contracted nystagmus he has to come to the surface into the light to work and if he has to return to the darkness, his disability as it were breaks out again?—That is so. Personally I would rather pay

my attention to trying to eliminate the disease entirely.

15,292. You know there is no such scheme of welfare in existence in the mining industry at the present moment?—Yes, it is so.

15,293. Have you ever approached any individual colliery employers with the view to their, as employers, initiating any such scheme?—No; but I have not been very closely in contact with the mining industry. I was in the factory department; and then under the Ministry of Munitions. My work was more in the factories.

15,294. Would you go so far as to suggest that the Home Office should appoint, apart from the question of nationalisation altogether, medical experts to look after the health of the men engaged in the industry?—I think that would be advantageous.

15,295. And should make what might be described as a Health Department—a permanent department?—Probably it would work in that way.

15,296. You say in your *précis* that more attention has been given to your propositions for welfare and health where the factories are either controlled establishments or national establishments than in the individual employers' concerns?—Yes.

15,297. How do you account for that?—For two reasons. One instance in the paragraph you have referred to, namely: that employers were allowed during war-time to charge as working expenses in calculating the Excess Profits Duty those monies spent on welfare provision. That is one reason, and the other is that I consider the employers of England during the war were earnestly wishing to do more than had been done in the past, quite apart from any monetary consideration.

15,298. I do not want to draw an unfair inference, but I would be right in saying that the added interest of the employers during the war has been largely due to the fact that they did not have to pay for it?—Yes, I have put those two inferences that I have mentioned, but I do not think it is fair, from my experience during the war, to ascribe it entirely to financial considerations.

15,299. I daresay you have been acquainted with the proposal for the establishment of pithead baths at the collieries?—Yes.

15,300. Do you regard that, as a professional man, as a proposition that would be likely to be beneficial to the health of the miners?—I do; I am strongly in favour of it.

15,301. Have you ever seen pithead baths at work?—I have not.

15,302. Unfortunately there are not many in the country, but there are some?—I know that is so.

15,303. *Mr. Herbert Smith*: Am I right in saying that you took part in the Gannister mines' enquiry in Yorkshire?—Yes.

15,304. Do you remember that for years, as an Association, we had been asking the employers to deal with these cases of silica disease?—That is so.

15,305. And that we have been agitating for years?—I understand that that is so.

15,306. Did you see the six men who were brought up to London suffering from it?—Yes, I saw those men.

15,307. Would you be surprised to know that all those six men are dead?—I am shocked to hear it; I did not know it.

15,308. Did you approve of the statement that we made that one out of every three was suffering from that disease after being 6 years in the pit?—I think that is probably a true estimate.

15,309. I find that we had to enforce during the war active regulations when Government was responsible because we could not get it out of private employers?—I think that is so.

15,310. You know that the Government during the war did carry a Bill to prevent these men dying every year or men being struck down by this disease without compensation being paid?—Yes, the Act was passed in 1918.

15,311. You remember there was a Commission held in 1905 to deal with that, and a Bill was attempted to be brought before the House of Commons and that the employers opposed it for all they were worth?—

8 May, 1919.]

DR. EDGAR LEIGH COLLIS.

[Continued.]

Are you referring to the Workmen's Compensation Act?

15,312. No, I am referring to the Silica Poison Bill dealing with compensation for Gannister miners. I did not know there was a Bill before the 1918 Act.

15,313. Are you aware that in that Act it is provided for these men to be examined at certain periods?—Yes.

15,314. And if they are found to be suffering from it it is wise to take them away from the Gannister mines and put them to some other industry, that a certain liability falls on the employer?—Yes, that is so.

15,315. You think that is a step in the right direction?—I do.

15,316. Have you spent any time in Yorkshire in milling districts and factories?—Yes, at some Yorkshire factories.

15,317. How do you account for the infantile death-rate being fairly large in the textile industries?—The latest evidence we have on the point ascribes it mainly to atmospheric conditions.

15,318. You find that at Meltham you get it as high as 176?—That is very high.

15,319. In colliery districts, too, it is fairly large?—Very high.

15,320. You get as high as 161 in colliery districts. Would you go a step further and say you believe there ought to be baths in every house, apart from baths at collieries?—I would.

15,321. You would insist on that?—I think everyone ought to have a bath in every house.

15,322. Coming back again to the question of miners' nystagmus, has there been any searching enquiry into this to see what causes it?—I think the causation now is quite accepted to be due to insufficiency of light in those pits when the safety lamps are used. It does not exist to the best of my knowledge in any of these pits where naked lights are in use.

15,323. The figures go rather to prove that, do they not?—They do.

15,324. If you make comparisons between Scotland and Yorkshire, you find that our percentage in Yorkshire is twice as big as in Scotland?—Yes, I think in Somerset and the Forest of Dean a case of nystagmus is never known.

15,325. *Chairman*: Do they have naked lights?—They are naked light pits.

15,326. *Mr. Herbert Smith*: Have you made any comparison between collieries which use the ordinary safety lamp and the electric lamp?—No, I have not had the opportunity.

15,327. Of course, there are comparisons being made between the two. May I take it that you are quite satisfied in your own mind, as far as you have gone, with regard to nystagmus, that if the conditions as to light were altered, we should have less of it?—I am confident that, if you got the light right, you would abolish the disease.

15,328. Has it come under your notice recently that a fair number of men who have been suffering from nystagmus have become insane?—I only know that by hearsay. I have not had an opportunity of proving it.

15,329. *Mr. Sidney Webb*: I see you say that your experience is that on the whole, leaving certain exceptions apart, you have found it more easy to get health improvements introduced in Government establishments than in private establishments?—Yes.

15,330. Then you say, what is very interesting, that where a private establishment was controlled under the Munitions Act, you found they were more willing to adopt the advice given than they were accustomed to in pre-war days?—Yes.

15,331. You attribute that to two things, apparently; that there was an accession of desire to improve health and also that under the Munitions Act the cause of the improvement did not become a charge on the employers?—Not entirely.

15,332. I should infer from that (I do not know whether I am taking it too far) that the ordinary desire to make a profit in private establishments was to pull rather against the making of costly improve-

ments?—Yes, but there is also the point that has been brought more prominently to the employers' notice recently, that these improvements are in themselves money making, in that they produce better workers, on the dictum that a poor workman is like poor land, he is always too expensive to hire.

15,333. I quite agree with you that it really would pay even the profit-making employers to spend money on health improvements?—Yes.

15,334. Of course, at first sight it seems that it might not pay?—That is so.

15,335. In the past, I should gather from what you have said (I do not want to overstate it) that whereas private employers have effected improvements for one reason or another, very largely out of philanthropy, nevertheless their feeling that they had to pay the expenses was a pull against their making those improvements?—Yes, certainly.

15,336. You point out that in Government-controlled institutions there has been less resistance to getting improvements made?—That is so.

15,337. With regard to the question of nystagmus, I understand you think it is the common opinion of those who have studied it that the disease might be prevented altogether if we could have sufficient light?—Yes.

15,338. What is the difficulty in having sufficient light in the mines?—The necessity because of explosions of having to have safety lamps guarded by gauze; then a coating of dust gradually gathers over the gauze, and that gets worse and worse as work goes on.

15,339. That is some time ago?—Yes.

15,340. But there are other alternatives?—The other alternative is the question of electric light, and the question of making electric light safe has stood in the way.

15,341. I believe there are a number of electric lights used in the mines which have proved sufficiently safe. What is the difficulty in making use of those electric lights universally?—There might be difficulty in getting them adopted.

15,342. It is merely the difficulty of getting them adopted?—Possibly that is so.

15,343. That is to say, if the mines were all belonging to the Government and you had the power to give an order, you could see your way to get rid of nystagmus?—As soon as I was assured that the lamp was a safe one from the mining engineer's point of view, if one could give the order, I believe nystagmus would cease.

15,344. Safety electric lamps, I believe, have been introduced to the extent of many thousands?—Is that so?

Mr. Robert Smillie: No such thing; it is simply nonsense to talk like that.

Witness: I know nothing about the lamps.

Mr. Robert Smillie: That shows the difficulty of people speaking about things that they know nothing at all about.

Mr. Sidney Webb: Then we will ask another witness as to that.

15,345. *Mr. R. H. Tawney*: Have you any figures about infantile mortality among the children of miners?—I have none with me.

15,346. Is it possible to get such figures grouped by industry and not merely grouped by locality?—I do not think any have been prepared.

15,347. Is the material for preparing them available?—It might be at Somerset House; it might be obtainable there.

15,348. At Somerset House?—Certainly; the Registrar-General's.

15,349. Would it be within your competence to give us any survey of infantile mortality among the families of miners?—It would have to be undertaken specially and the data would have to be obtained from the Registrar-General's figures; he would be the person, I think, to prepare it.

15,350. Is it within your knowledge that the infantile mortality in certain mining districts is exceptionally high?—Yes.

8 May, 1919.]

DR. EDGAR LEIGH COLLIS.

[Continued.]

15,351. Have you any view as to the probable cause of that?—I think the evidence is that the most potent cause is atmospheric conditions.

15,352. What does that mean exactly?—You find the lowest infantile mortality rates on the west coast of Ireland and Scotland among the poorest people very badly housed; some of the higher rates are in the industrial areas where the atmosphere is polluted by the industry carried on; it is not always a question of housing.

15,353. It is the question of the air being partially poisoned by the industry?—Yes.

15,354. You say, if I understand you rightly, that on the whole you found Government Departments better to deal with in the matter of health and safety than private employers?—Yes.

15,355. Supposing you were asked to organise a scheme for improving the health of the mining population, do you think you would find that more easy or more difficult, supposing you were dealing with a Government department than if you were dealing with the present 1,500 odd firms?—From my experience of factories I should say it would be easier to deal with a public department.

15,356. That is to say, as far as health is concerned, you think on the whole that more is to be got from a public department in the charge of industry than the present private employers, omitting exceptions, of course?—You can get things done quicker.

15,357. *Sir L. Chiozza Money*: You were in charge of the welfare department of the Ministry of Munitions for some considerable time?—Yes.

15,358. Was it the case, whenever it was necessary from the exigencies of the war to bring a lot of workers together for the purpose of a particular industry, that steps were taken to make provision for housing and welfare?—Yes.

15,359. Do you not think that it is rather surprising that in all the long history of British industry since the industrial revolution began similar steps were not taken by private employers or committees or conferences of private employers during the period of perhaps a century or a century and a half to do similar work, when the Ministry of Munitions found it possible to do it in only three years? Do you not think it rather surprising?—It is. I have always ascribed it to the fact that our forefathers copied their forefathers.

15,360. Has not that continued through five generations till the Ministry of Munitions was established by Mr. Lloyd George in 1915?—Yes.

15,361. Do you not find it a very great gain to have at your disposal the information collected by a great national organisation in charge of a large part of this work? Did you not find it a great gain to have a report as to what one national factory was doing or another national factory was doing, so that you could compare one with the other?—Yes, that is true.

15,362. Did not that enable you to make a lot of improvements and take much more care of the health of the workers in the munition factories as a whole than you would have been able to if you were advising a private firm?—Speaking always under the exigencies of the war, because you will see the national factories were growing even until the Armistice was declared.

15,363. Had you not very great difficulties to contend with in respect of materials and labour to supply all these things?—Particularly towards the end, very great difficulty, indeed. We used to get permits and priority for them.

15,364. You were able to do a very large amount of this national health and welfare work in spite of great difficulties in obtaining materials and labour, which would not exist in times of peace?—That is perfectly true; we could have done a great deal more in a time of peace.

15,365. This is a serious matter, as you see. Supposing you, with your present knowledge and experience, were put in charge of a great national organisation, either collieries or iron and steel works, or any other great industry, would you not be able to apply these methods that you applied at the Ministry

of Munitions, but with very much greater advantage and facility in times of peace?—Yes.

15,366. Is it not clear that a thing that could have been done very easily indeed in the past has not been done?—I think so.

15,367. Did you have certain conferences during your work at the Ministry of Munitions?—Yes.

15,368. Did you call together the Welfare Supervisors at the different national factories, so that they could compare notes?—I called together all the officers of the welfare section, constantly comparing notes, particularly to one conference; and as regards the boys' supervisors I got them together in London, but it was difficult to get all the Welfare Supervisors away from their factories when they were so busy at work.

15,369. You had a conference on the boys, for instance?—I did.

15,370. Is it a fact that at one time you had a million workers supplied at munition canteens? Did you work up to about a million?—For the moment I forget whether it was a million meals a day or whether it was a million seats. I have forgotten my figures for the moment.

15,371. It was one or the other?—Yes.

15,372. Practically the whole of that accommodation was new accommodation provided for the exigencies of the war?—That is so.

15,373. Were you able to make researches as to food values?—We did.

15,374. Do you mind expanding that? Were you able to examine food values with regard to different occupations, and so on, and supply valuable information to the Ministry of Munitions?—We were. We have been continuing to carry on those food investigations right up to the present.

15,375. Did you find in connection with these many operations of yours that you were able by these efforts to raise the standard of life of men in quite rough occupations and do something for them?—I am confident we did.

15,376. *Sir Allan Smith*: You refer to canteens. Has there been any trouble in the institution of canteens?—Only the difficulty that we had in getting materials to build them with.

15,377. Has there been any difficulty in instituting canteens on account of the want of space in which to build them?—I was including that in the difficulty of construction.

15,378. I assume from what you say you agree that in some factories there was no room to build a canteen?—No, they were so circumscribed in their curtilage.

15,379. Do you know what proportion of men for whom accommodation was provided utilised these canteens?—I cannot reply accurately about that; I am sorry I did not look the figures up before I came.

15,380. Was it a large proportion of those employed or a small proportion?—A small proportion of the total number of men working had canteen accommodation which they could use, but at the factories where the accommodation was provided it was fully used. I do not say that means that all the men used the canteen, but the accommodation was used practically to its fullest extent.

15,381. Have you had experience of men refusing to use the canteens and preferring to go elsewhere for their food?—Yes, and preferring to bring their food with them, as they had done all their lives. That form of conservatism was always there, but it was passing.

15,382. You say it is easier to get things done in a Government-controlled concern than in a private concern?—Because the advice given is taken as a command.

15,383. Who gives the command?—The manager.

15,384. From whom does the command come?—The expert makes the recommendations.

15,385. Is that a departmental person?—Yes.

15,386. You find in all cases that the manager complies, do you?—If he did not comply, then it was a matter of departmental consideration at headquarters.

8 May, 1919.]

DR. EDGAR LEIGH COLLIS.

[Continued.]

15,387. The manager has to take instructions from the Government department?—From the expert who visits.

15,388. Whether he agrees with the proposal or not?—Yes.

15,389. With regard to infantile mortality, do you suggest that there are other causes contributing to the higher percentage in the colliery districts than the actual housing question?—I have not suggested the housing question. I have twice replied to that that the atmospheric conditions are the most important.

15,390. You think that is the major proposition?—All the evidence points that way.

15,391. Are you acquainted with the powers of Local Authorities and County Councils in the matter of housing?—Not very intimately.

15,392. I suppose you know that they have the power to close houses which become insanitary?—Yes.

15,393. Do you know whether these County Councils have exercised their power to the fullest extent in the past?—No, they have not.

15,394. Do you think, if the houses are insanitary and the County Council have not exercised their powers, that they were culpable to that extent?—Yes, certainly.

15,395. You speak of the periodical examination for disease: do you know whether in Woolwich Arsenal and in the Dockyards there is a preliminary examination of men who are taken on?—I do not know whether it is for every form of occupation now, but it is a custom to examine men before they start work.

15,396. Do you think that is a wise precaution?—Very. I think it ought to be carried out far more than it is.

15,397. I think you also said that employers were willing during the war to do welfare work irrespective of monetary considerations?—Yes.

15,398. You also say that one of the active inducements was that they would get a proportion of the expenditure back in the matter of excess profits?—Yes.

15,399. Would you suggest that for the latter reason the activities of the employers in the various industries in connection with welfare work cease or would diminish now that the Excess Profits Duty is reduced?—I think it may diminish in proportion.

15,400. Are you aware that within the last year or 18 months the employers have taken up this matter themselves and have actually started a Welfare Association of their own?—Quite well.

15,401. Do you know that that Welfare Association has done very good work since it started?—Very good work.

15,402. Are you also aware that the number of the employers which subjected themselves to the benevolent control and who accepted the advice of this centralised expert has been increasing from day to day?—That is information to me.

15,403. If you were to accept that, would you rather modify your anticipation that the interest of the employers in welfare would now be reduced?—I did not say the interest in welfare would be reduced; I said the incentive to carrying out welfare improvements would be reduced—or, at least, I intended to do so.

15,404. I understood that the institution of such a thing and the co-operative efforts of employers rather tend to the belief that the incentive has not been reduced?—Getting instruction how to act and the incentive to do a thing are two different things. The Association which you are referring to now is doing its best to educate the employers in the advantages to be gained. Surely that is rather a different thing from the monetary incentive.

15,405. Do you really seriously suggest that the activities of employers with regard to welfare will be reduced from now on?—No, I do not, and I devoutly hope it will not, or I should have done poor work during the last two years.

15,406. Therefore you look forward to an increasing interest on the part of the employers in the welfare of the workmen?—I do.

15,407. I should like to know what is your view of the Welfare Association?—I admire it immensely.

15,408. May I ask you when the Government themselves began to realise the necessity for a welfare campaign—was it at the commencement of the war?—Mr. Lloyd George instituted the welfare and health work at the Ministry of Munitions in 1915.

15,409. What brought it to his notice?—The Health Munition Workers Committee's work.

15,410. Any special class of munition workers?—The committee on the health of munition workers was set up for all classes.

15,411. With regard to any special class of munition workers?—More particularly on behalf of the women who were coming so fast into the munition industry then.

15,412. I suppose you will admit that questions of welfare are questions of development?—Quite so.

15,413. And as things go on one realises a little more the importance of that?—Yes.

15,414. Would you admit that the sudden influx of female labour into industries where they had not been hitherto engaged necessitated immediately some attention being paid to welfare?—To speak frankly, we made that our excuse.

15,415. I am glad to find that the Government has still got to resort to that expedient. You say the supervision of the health and safety of workers cannot be left entirely to the workers themselves. Why do you say that?—Because they do not realise what is for their own good.

15,416. What is the result of their failure to recognise what is for their own good?—I should instance in the immediate industry under consideration the provision that there is under the Act that if two-thirds of the miners ask for baths they must be provided. I do not know the exact number of occasions on which two-thirds of the miners voted for baths in the Kingdom, but I believe they can be numbered on the fingers of one hand.

15,417. I am afraid you have taken an unfortunate example. Is it not the case that the miners have to contribute to the expense of these baths?—That I do not know.

15,418. You are more acquainted with the factories?—Yes.

15,419. You are acquainted with the provisions in brass and other dangerous industries with regard to washing and laying on of hot and cold water?—Yes.

15,420. Are you satisfied that full use is made of these precautions?—Not in every case, but it is not infrequent when the provision is first installed that it is not rightly or properly used. On the other hand, my experience is that use and proper use is soon made of it. I can remember one or two instances: one I have particularly in my mind where, soon after a code of regulations had been established calling for the provision of washing accommodation, I happened to be visiting the factory. The manager had a great deal to tell me about the way the soap had been removed, the basins broken, and the towels torn up; and he did not care very much about me. I happened to visit him seven months later, and my colleague said, "Ask him about the washing accommodation." I did not want to, because I thought again I should not be popular. However, I did. He said, "You know all about it." He said, "You know the men went out on strike last week because the water was not warm." Now that was only in six months, and it was in a district that was not considered to be a very forward district of the Kingdom industrially. It was in South Wales, not far from Swansea, in the metal industry. I could multiply instances like that.

15,421. The multiplication of these instances would prove one thing—that it is absolutely impossible in dealing with workmen to cut a hard and fast line and say to the workmen, "You must take advantage of this"?—That is what was done. We had the regulation; to the manager you must supply these things; and also the regulation to the workers; you have to use them.

15,422. Have you found that the regulation to the worker, that he has to use them, is of any value whatever?—Yes, I certainly think so. It was one of a

8 May, 1919.]

DR. EDGAR LEIGH COLLIS.

[Continued.]

code of regulations aimed at reducing lead poisoning, and it had its effect among other regulations.

15,423. Do you find the same thing applied in the case of mechanical precautions, such as guards? Have you found that they are removed?—Most certainly they are.

15,424. Have you found cases where appliances for such as chipping and so on are never used?—That is so.

15,425. Would you agree that welfare and safety are questions upon which the employer may require education and on which the workman equally requires education?—Absolutely. I am of opinion that you must get at the individual, otherwise you would be sure to fail.

15,426. Would you, therefore, say that it would be unreasonable to condemn the employers because they had, as is stated, failed to do what was necessary in the past with regard to the safety and welfare of their work people?—I am afraid I am bound to answer: Yes, I do condemn them.

15,427. Why do you condemn them?—They say that the workers do not know how to use these things.

15,428. I have not suggested that. I have suggested to you that the workers will not use them after they have been provided?—That, I think, is the very gravamen of the accusation against the employers, that the workers have not been educated in their use. The employer is the educated person, and he has the knowledge of hygiene in these matters which the workman has not, and it is to be laid to the charge of the employers that the workpeople do not know how to use them.

15,429. Are you talking from a sociological point of view or from the point of view of the Factory Act?—Both.

15,430. Then I assume you admit that the factory legislation has been one of progression?—Yes.

15,431. And to that extent the Factory Department of the Home Office is equally to blame?—The Factory Department of the Home Office exists to carry out the provisions of the Factory Acts. They cannot go further than Parliament has given them power.

15,432. I apologise. I am not quite *au fait* with the details of administration, but I suggest that it is unfair that you should take advantage of my ignorance in the matter. I refer to the Home Office: are they not equally to blame in the respect that they have not anticipated this matter?—What matter are we particularly dealing with now?

15,433. Welfare and safety?—They have powers under the Act of 1916.

15,434. To what extent have they exercised them?—Quite a number of orders have been issued already.

15,435. Such as what?—First aid for ambulance rooms, and rest rooms.

15,436. When was that issued?—I think in 1917, the 1st of January.

15,437. So that you have had to wait till 1917 to get an order by the Home Office providing four ambulances?—That is so.

15,438. You will admit that with regard to first aid, many extensive installations of first aid appliances had been made prior to that?—That is so.

15,439. At the top of page 2 in the first paragraph you say: "My experience as a factory inspector is that advice as to improving conditions of employment was more readily adopted in establishments under Government control, such as Woolwich Arsenal, or the Admiralty Dockyards, than in the majority of privately owned factories and workshops. Government industrial establishments come under the Factory Acts, and so are inspected." Of course you cannot prosecute a Government establishment?—No, you cannot.

15,440. You say in both of those cases "it was." What would you say about the present tense, not the past?—I am entirely speaking there of what was, because I am not now acting as a factory inspector. I am speaking of my experience during the time I was Inspector of Factories. For the last two years I have been in the Ministry of Munitions.

15,441. So that you are not in touch with what is going on at the present moment?—Not personally in touch.

15,442. With regard to the provision of nurses and provisions for the general welfare of young persons, would you say that a large advance has taken place within the last five years?—Yes; but why five years: I should say three. All the advances have taken place during the last 3 or 3½ years.

15,443. Would you, as a director of the Welfare Section at the Ministry of Munitions, take full credit for everything that has been done?—On behalf of the section we can fairly claim a great deal of credit.

15,444. You do not suggest that the employers are not altogether mindful of their responsibilities?—Oh, no.

15,445. Do you find now, so far as regards the welfare provisions, you have the same difficulties that you had at the beginning of your activities, so far as the employers are concerned?—My position now is rather anomalous in that the activities of the Ministry of Munitions have practically ceased in that matter, and I have not resumed work as a factory inspector: I am clearing up.

15,446. What are you now: are you between wind and water?—I am between wind and water. I am clearing up a lot of work.

15,447. Then later on we may get some information from you, when you get back to the Home Office, as to what has been done?—Possibly.

15,448. *Sir Arthur Duckham*: With regard to this welfare work at the Ministry of Munitions, you may know that I was at the Ministry of Munitions for a few years?—Yes.

15,449. I quite agree with you as to the work that has been done at the Ministry of Munitions with regard to welfare. The only point I would ask is whether the ease of getting money and the very drastic powers we had at the Ministry of Munitions were not two reasons for getting your work through?—They were very powerful reasons.

15,450. They overcame the difficulties of material entirely?—Yes.

15,451. You never knew of any case in which the Welfare Department did not get its own way practically?—There were practically no cases.

15,452. From the production side they were practically our bosses as far as the welfare was concerned?—Yes.

15,453. We could not say yes or no, that it was a wasteful scheme—we could not do it. I would ask you whether you know of any cases where this freedom with the nation's money—because, after all, it was practically the nation's money—and this very drastic power we had led to extravagance. Have you had any cases brought to your notice?—I cannot recall a case of what you would really call extravagance.

15,454. Did you ever have to pull up your people for being too lavish in their ideas?—Yes, when our officers sometimes came back and made recommendations, we had all recommendations vised at headquarters before they were carried out, and some of the officers would ask for more than was reasonable.

15,455. Did you ever get a department of the Ministry of Munitions pointing out that the recommendations were too lavish?—Yes, then it was a matter of consideration between us and we came to an agreement.

15,456. *Sir Adam Nimmo*: You were asked certain questions with regard to the treatment of nystagmus?—Yes.

15,457. And you suggested that it might be a very good thing to have an examination of the young lads with a view to see whether they were liable to be subject to nystagmus or not. Would that not necessarily involve a general physical examination of the lads?—I think a general physical examination of anyone who was going to devote his life to mining would be very advantageous, but on the point of nystagmus I think a general physical examination would not enable you to determine whether the youth would become nystagmunt.

15,458. If you had to examine lads would you not examine them in relation to other defects which might become apparent in work?—Yes.

15,459. I suppose you might require to have a general physical examination of the men?—I am a great advocate of that.

8 May, 1919.]

DR. EDGAR LEIGH COLLIS.

[Continued.]

15,460. Do you think the men themselves would be willing to agree to that?—The present generation of men would not take to it very kindly, but wherever we have had to put on medical examinations they have always come to them and taken it as part of their employment very soon.

15,461. You do not think they would look upon it as another form of conscription?—Certainly; the medical examinations that we were carrying out during the war time in the factories we very nearly got stopped over because the men thought we were trying to find out whether they ought to be conscripted.

15,462. I was putting this question to see whether it did not inevitably carry you much further than you intended by implication?—The examination of the eye need not carry you further, but if you ask me should I look upon it as anything bad if it were carried further, I should say no, and if you ask me if I think, in the long run, no opposition would come from the workers, my opinion is that it would become perfectly simple to carry out.

15,463. As time went on?—Yes.

15,464. I think it was suggested to you that it would be a desirable thing to have a Health Department connected with industry?—Yes.

15,465. I suppose the question of general health is a public question?—Yes.

15,466. It is proposed to set up a department of public health?—Yes.

15,467. I take it that the questions involved in public health will come under the supervision of that department. It is rather suggested that the private employer does not take very much interest in the health considerations affecting his workmen?—Yes.

15,468. Taking the question of nystagmus, is it within your knowledge that certain doctors made a careful investigation into nystagmus, and that the late Sir Arthur Markham at once intimated that he was prepared to give a prize for the best electrical lamp that could be produced?—I was not aware of that.

15,469. Still, if it is true it shows that there are certainly employers who are very much concerned about the physical condition of their workmen.—Some employers are splendid.

15,470. And are anxious to do the best they can for them?—Most certainly.

15,471. May I ask you a question or two with regard to the infantile death rate among miners' children. You suggest that the main cause is atmospheric conditions?—That is the conclusion drawn by the Medical Research Committee's Report that was issued last year.

15,472. Would you say that it was fair to suggest that it might be very largely due to the increased birth rate?—I should not accept that.

15,473. I am not suggesting that we want any fewer births among the people. Is it within your knowledge that it is due to the increased birth rate among the people?—No, certainly not.

15,474. I take it that you are aware that the number of births per thousand persons among the mining population is very much higher than in other industries?—Yes.

15,475. Do you know the figures?—I have not them before me.

Chairman: I have two Medical Officers of Health coming to speak to this very point.

15,476. *Sir Adam Nimmo:* Then I do not want to press it any further. I take it that, generally speaking, your view is that supervision in respect of health is not inconsistent with freedom of control of production?—That is so.

15,477. You are not here to advocate that we must nationalise the mines in order to bring about the results that you have in view?—No.

15,478. As a matter of fact, I gather from your *précis* generally that you believe in freedom of movement?—Yes.

15,479. Do you agree that local organisation might come about without Government action?—Local organisation certainly could come about without Government action, but the general co-ordination of

knowledge so obtained could hardly be carried out without a central organisation.

15,480. Would there not be a certain amount of freemasonry, if I may use the expression, between the various medical men who were working in the various industries under such an organisation?—That is what has been tried in the past and has not been successful, so we are getting a Ministry of Health to-day.

15,481. The Ministry of Health would help to co-ordinate the organisation without the necessity of nationalising the means of production?—I think so.

15,482. I take it that in your view, from your experience, it is quite possible to carry out a scheme of co-operation between owners and workmen which would cover the interests of welfare and would see that better social conditions were established within the industry?—Certainly it is possible, but I have no example before me of action of that kind having been taken by any industry in the past. That is all.

15,483. But you rather suggested, I think, in part of your evidence that you saw evidence of a new spirit being introduced?—That is right.

15,484. You made it clear, I think, that there was what you call an added interest on the part of the employers?—Yes. It was not altogether final.

15,485. Is not the position this, whether on the Government side or the side of the employers there has been a great awakening as a result of the war?—Yes.

15,486. And that the action which the Government has taken has merely been in the light of these facts?—The Government has done a great deal to make the facts known and to ascertain the facts.

15,487. Is it not the case that the Government merely reflects public opinion at any time?—Yes, but in this case it has done more; it has ascertained the facts as well as making them known.

15,488. Would you agree with me when I suggest that there has been a levelling up in respect of public opinion generally upon this question?—I quite agree that there has.

15,489. And that if the industries are left entirely alone this spirit moving within the industry will bring about the results we desire?—I do not think so, because there is a great deal of knowledge to be obtained which can only be obtained by an organisation moving from industry to industry and comparing the facts, and you must have an organisation to be able to advance knowledge on these matters; then that knowledge is made known and public opinion has followed.

15,490. I think you suggested that this co-ordination of knowledge would be brought about by the public department without interfering with any freedom of movement in the industry in respect of its production?—That would be working on that line, but you have to have a central organisation to do it. That is what I want to keep clearly before you.

15,491. You are not suggesting that we should tie up the industry in order to bring about attention to these considerations of public health?—I am only concerned with the fact that the welfare and safety points are best conducted by a central organisation.

15,492. All that can be done without interfering with the management and administration of the industry?—That is for others to settle. I cannot express a skilled opinion there.

15,493. *Mr. Evan Williams:* You say that your experience of mining has been very slight?—Quite so.

15,494. Have you had sufficient experience to say that the conditions in factories are comparable with those of mining?—It is not comparable at all.

15,495. Is your knowledge sufficient to enable you to draw any conclusion as to whether the mines should be nationalised?—I have not made any suggestion about the nationalisation of mines. I have only pointed out what my experience has been in the past.

15,496. Is that a conclusion you wish to draw?—I do not wish to draw any conclusion on the matter. It would be absolutely presumptuous of me to put forward such an opinion.

8 May, 1919.]

DR. EDGAR LEIGH COLLIS.

[Continued.]

15,497. You do not think there is any necessity to nationalise mining in order to bring about a better state of things?—It would be equally presumptuous for me to say the opposite.

15,498. You think there is a necessity for regulation by Government and not by the employers themselves?—That is so.

15,499. And that the carrying out of these regulations must be seen to by Government?—Yes, that is right.

15,500. Is there any greater difficulty, as far as mines are concerned, in carrying that out under private ownership than there is under State ownership?—Only the experience I have had of the greater ease of getting compliance with the advice given by the experts in Government-controlled establishments than in private-owned establishments.

15,501. In Government establishments is there not mechanical obedience to regulations?—Practically.

15,502. Without room for any intelligent discretion?—No, I cannot accept your adjective.

15,503. *Mr. Arthur Balfour:* I think you agree that it would be wise for the miners to change their clothes when they come out of the pits and have them thoroughly dried?—Yes.

15,504. It has been suggested to you that the employers have been lax in the past century in connections with their employees' health?—Yes.

15,505. Do you not think that, if there is any blame, it ought to be shared by the Government for not setting up a Department of Health?—I naturally see things through my own medical spectacles, and it appeals to me. Perhaps I am a little prejudiced by being a medical man.

15,506. Has not the time come when the whole public health should be considered more than it has been in the past?—Yes.

15,507. It is true, is it not, that large extensions have been made during the war, and greater opportunities have been given for welfare extension?—Yes.

15,508. And that in these large national factories, where you have very large units, it is easy to provide for the welfare?—Yes, proportionately more economically.

(The Witness withdrew.)

EDMUND HENRY, EARL OF STRAFFORD, SWORN and Examined.

Chairman: The Earl of Strafford is a trustee of the late R. G. E. Wemyss, Esq., Torrie and Rennie-swells, etc., Coalfields. These are the questions that were sent out to him, and the answers:—

Question 1.

The acreage of your holding of land, and of the proved mineral rights?

Answer.

The acreage of Torrie Estate, including foreshore, is 1,383 acres, or thereby (Estate 756 or thereby; Foreshore 627 or thereby).

The coal and other minerals are let to the Fife Coal Company, Ltd., until Martinmas, 1939, subject to breaks.

The acreage of the Rennie-swells, Over Inzievar, Langleas, and Fernwoodlee Coalfield is 567 acres or thereby. The coal is let to the Coltness Iron Company, Ltd., until Martinmas, 1944, subject to breaks.

NOTE.—The surface of Rennie-swells, Over Inzievar, and Fernwoodlee belongs to A. D. Smith-Sligo, Esq., of Inzievar.

Question 2.

The total output of coal and other minerals, to date?

Answer.

Torrie Coalfield was let over fifty years ago, but the lease was abandoned. The field was let to the Fife Coal Company, Ltd., with entry as at Whit Sunday, 1908. The output of coal from 1912 to 1918 was 110,158 tons, and the lordship on coal sold during that period £7,116 17s. 6d. (79,259 tons).

Rennie-swells, etc., Coalfield has been worked for over fifty years, but the total output to date is not known. The output from 1909 to 1918 was 672,473, and the lordships on coal sold (575,731 tons) during that period £8,521.

No other minerals worked from these fields.

Question 3.

The average annual output of coal and other minerals (10 years' average)?

Torrie Coalfield.—11,016 tons output; sold, 7,926 tons.

Rennie-swells Coalfield.—67,247 tons output; sold, 57,573 tons.

No other minerals worked.

Question 4.

The royalty payable per ton, whether fixed or on a sliding scale?

Answer.

Torrie Coalfield.—One-twelfth of net selling price.

Rennie-swells Coalfield.—Fixed rates of lordship.

Question 5.

The average annual income?

Answer.

Torrie Coalfield.—(10 years' average), £712; average rate of lordship per ton, 21·537d.; pre-war average, 11·536d. sold.

NOTE.—The Trustees have paid to the Inland Revenue, in respect of Excess Mineral Rights Duty, years 1914, 1915, 1916, 1917, and 1918, the sum of £1,679 6s. 8d.

Rennie-swells, etc., Coalfield.—(10 years' average), £852; average rate of lordship per ton sold, 3·552d.

Combined Coalfields.—(10 years' average), 65,499 tons of coal sold (output 78,263); average lordships, £1,563; average lordship per ton of coal sold, 5·729d.

Question 6.

The nature of the root of your title or titles?

Answer.

(The lands of Torrie, Wester Inzievar, Easter Inzievar, and others):—

Precept from Chancery in favour of James Erskine Wemyss, dated 25th April, 1837.

Precept from Chancery in favour of James Hay Erskine Wemyss, dated 8th August, 1854.

(For Statement see next page.)

8 May, 1919]

EDMOND HENRY, EARL OF STRAFFORD.

Wemyss Estates Office,
East Wemyss, Fife,
5th May, 1919.

JAS. EDMOND,
Factor.

15,509. Mr. Robert Smillie: You say the acreage of the Torrie estates, including the foreshore; have you the foreshore down to low water mark? How far do you follow the seam?—That, I am afraid, I am unable to tell you.

15,510. Are you working on the sea coast?—It is near the sea that it is worked.

15,511. You say it includes the foreshore?—I think so.

15,512. That is along the sea coast?—Quite so.

15,513. Do you know how far your rights go out?—I do not.

15,514. The trustees have not worked any coal on this estate themselves?—Not on the Torrie estate.

15,515. Have the trustees of the Wemyss estate worked any coal at all?—Not the estate trustees.

15,516. The Torrie coalfield you say was let over 50 years ago, and the lease was abandoned. Do you remember what company had it 50 years ago?—No, I am afraid not.

15,517. Do you remember or not whether shafts were sunk?—I have no idea. I do not know.

15,518. The field was let to a private company in 1908. Did the output only start in 1912?—Quite so. From the figures here produced I suppose that is the case.

15,519. Will you look at the end of your *précis*; it is signed James Edmond, factor. Was this made up by James Edmond, factor?—That is so.

15,520. And simply put into your hands?—That is so.

15,521. It is usually taken that the *précis* that a witness hands in is his own and that he is able to speak to it. This is not yours?—It is not mine. It is prepared by the factor to the trustees.

15,522. Chairman: What is the name of the factor? James Edmond.

15,523. Would it not be more convenient for us to call him?—I think he could speak with more authority to the actual figures, as to how these figures are arrived at.

15,524. I quite agree with Mr. Smillie that it is far better to ask a gentleman who knows something about the subject than a gentleman who does not?—Quite so.

15,525. Mr. Robert Smillie: Perhaps the witness might know more about one point than even the factor, and that is about the titles. Have you ever seen this precept from Chancery in favour of James Erskine Wemyss dated 13th April, 1837?—No, I have never seen it. I think on the question of the title it would be better to call the law agents than ourselves.

15,526. I understand the Secretary invited Captain Wemyss, and Captain Wemyss said he was not the person who ought to be called; that somebody else ought to be called. This Commission has been set up for the purpose of inquiring whether or not it is in the interests of the nation to nationalise the mines and minerals?—Quite so.

15,527. We are anxious to know whether the minerals held under the land held by the Wemyss trustees should be nationalised, and we want to know whether in that case, as in hundreds of other cases, a title can be shown to justify the present owners?—Quite so.

15,528. Could you give us any information on that?—I could not personally give you any information without information supplied by the law agents of the trustees.

15,529. You are the Chairman of the trustees?—No, I am one trustee of three.

15,530. Who are the others?—One is the widow of the late Mr. Wemyss, Lady Eva Wemyss, and the other is Sir Rosslyn Wemyss. He is the First Sea Lord of the Admiralty.

15,531. Is he one of those for whom you are a trustee?—That is so.

15,532. You hold meetings, I suppose, occasionally?—Yes, we do.

15,533. Have you had a meeting since this Commission was set up?—No.

8 May, 1919.]

EDMOND HENRY, EARL OF STRAFFORD.

[Continued.]

15,534. Did you consult either of your two co-trustees before you came here?—I have seen Sir Rosslyn Wemyss, but not on these figures.

15,535. Did you get an invitation from Mr. McNair to come here?—Last night.

15,536. Was there anything added to that invitation as to bringing some documents?—No, I had a telegram which I received last night.

15,537. You have not as far as you know seen the charter or the title deeds or the precept from Chancery in favour of Erskine Wemyss?—To my knowledge I have never seen any of the legal documents.

15,538. *Sir Adam Nimmo*: You were asked by Mr. Smillie as to whether the trustees had worked any coal upon your estate, and I understood you said, No.—No.

15,539. Is it not the case that the late Mr. Randolph Wemyss spent enormous sums of money upon the endeavour to develop this estate?—Very large sums of money.

15,540. Did he not expend large sums of money in developing a tramway system?—That is so.

15,541. Was he not very energetic in laying out what would be regarded as very progressive houses for the workmen?—Certainly.

15,542. Associated with his colliery?—He did that.

15,543. It is publicly reported that as proprietor he crippled himself financially in an endeavour to develop the resources of his property to the fullest extent possible?—I think that may be so. Possibly I should not be here as a trustee if that were not the case.

15,544. In any case, we have here a proprietor who was particularly progressive in his endeavour to develop the resources at his disposal?—Certainly.

15,545. I assume that the trustees are opposed to the nationalisation of minerals?—I cannot speak on behalf of my other two colleagues.

15,546. *Chairman*: I see Mr. James Edmond is the factor, and his address is given as Wemyss Estate Office, East Wemyss, Fife.—Yes.

15,547. Is he unwell?—No. He may be here for all I know.

Chairman: I will call him.

Witness: No, he is in Scotland, I understand.

15,548. *Chairman*: Is he unwell that he is not able to come?—No, he is not unwell.

Chairman: Is Capt. Wemyss here?

Capt. Wemyss: I am here.

(The Witness withdrew.)

MICHAEL JOHN ERSKINE WEMYSS, Sworn and Examined.

15,549. *Chairman*: I have not the pleasure of having a proof of yours, so I must ask you one or two questions. When did you come into possession of the estate as tenant for life?—The estates are managed by 3 trustees and I am afraid I have not any interest in it at all. It all goes to the mortgagees. I am not even a trustee.

15,550. All the income goes to the mortgagees? Yes.

15,551. You personally do not know much about it?—No, not the estate management.

15,552. Who is the gentleman who would know all about it?—The factor, Mr. James Esmond, and Mr. Gemmell, the mining engineer.

15,553. We have had him here.—He is in the room now.

(The Witness withdrew.)

MR. JOHN TRYON, Recalled and Further Examined.

15,554. *Chairman*: Will you kindly go on reading your proof from the point where you left off yesterday afternoon.

Witness:

"Reasons against Nationalisation.

I base my objections on the following grounds:—

1. That minerals (except royal minerals) have always been recognised as private property and as such have been the basis of legal transactions between vendor and purchaser, lessor and lessee, mortgagor and mortgagee, and the financial security of the community is based on the sanctity of private ownership, and in cases where property has been compulsorily acquired it has been at any rate on the theoretical basis that the expropriated owner shall not suffer pecuniary loss. Hence on the acquisition of a business the expropriated owner has, generally speaking, been entitled to the cost of reinstatement. As regards proof of title, the Courts have held that a mere possessory title of twelve years when it confers an indefeasible title to the surface also confers it as regards the minerals under it, and it is idle to dispute the present legal ownership to-day.

2. That the payment of royalties to a Lessor makes it his interest to see that no coal workable at a profit should be left ungot or wasted and also tends to ensure that the colliery shall be so developed and worked that there shall be as little risk as may be of fire or other accident prejudicial to the life of the Colliery, in like manner that small houses built on land held under ground lease are generally far better built than those erected by speculative builders on their own freehold.

3. That a large part of the wealth of the persons constituting the Nation is fixed, such as land, mines, etc., but such fixed wealth is of little or no productive value without the application to it of floating capital. An attack on any form of fixed wealth tends to the

limitation of the application of floating capital to fixed wealth generally, thus depreciating the productive value of all fixed wealth whether the subject of the particular attack or not. This fact has been clearly demonstrated by the result of the special taxation of land by the Finance (1909-10) Act, 1910, which undoubtedly reduced greatly the building of houses from which the community is now suffering.

4. That any attack on fixed wealth causes great difficulty in borrowing money on the security of it. As a Director of a Financial Institution with funds of about 20 millions sterling, this is within my own knowledge. Hitherto Mining Royalties arising from developed and properly managed mines have been considered a sound security and basis for credit. It is in my opinion dangerous to the community to shake confidence in the permanency of such security. In my opinion the existence of such an enquiry as the present one in itself tends to bring along Financial trouble in our present state of indebtedness.

5. Seeing that the product of industry must after the expenditure of that required for cost of production be sufficient—

- (a) To provide a sufficient reserve to maintain the industry and to replace that destruction of capital which is continuous, and provide for further development.
- (b) To provide its due proportion of national revenue.
- (c) To provide a sufficient rate of interest for money invested in it.

My view is that nationalisation would imperil the provision of all of the above because there would be continual political pressure to reduce the necessary profit whereby the national wealth would be diminished, whereas it is all important that there should be an accumulation of wealth.

6. That private ownership of commercial undertakings constitutes a large market for any invention

8 May, 1919.]

MR. JOHN TRYON.

[Continued.]

of practical use, while if the ownership is in one hand there is no competition, and the talents of inventors would not be likely to be put in exercise to the same extent under State as under private ownership. Coal mining with its allied trades does not appear to be any exception to this principle. Also young men of ability are more likely to get recognition at an early date under private than under State ownership.

7. That it is prejudicial to the community that the State should be an ever-increasing employer of labour unless the equivalent of Military Law is applied to State employees. A strike of workmen against a private employer is comparatively an unimportant event. A strike of workmen against the State is a defiance of the State.

8. That it is the function of the State to govern, not as such to compete with the governed in industry, and there is no reason why the State should conduct mining operations, which would not be equally applicable to agriculture. There is as great diversity in conditions of agriculture such as quality and value of land and of crops as in the mining industry. If the State carried on the industry of coal mining the great protection given to miners by the Coal Mines Regulation Acts would be seriously weakened. Officials of the State are not likely to be more competent or more careful than the managers of private enterprise. The probability is that every effort would be made to conceal any incompetence or carelessness on the part of the State official, while inspectors for the State are keen to detect errors in the case of private ownership.

An instance showing that the State is not immaculate because public recently in the case of the vendor of butter proved to be adulterated but admitted to have been supplied by the Government to him for sale, the Magistrate refusing to allow the prosecution to be withdrawn at the Government's request.

9. That the evidence of the Inland Revenue Authorities is conclusive that, so long as colliery owners were uncontrolled, the trade was content with the very moderate average rate of about 8 per cent. interest on actual capital invested in the trade, and I cannot find that colliery owners have done anything to justify their expropriation. I have read the evidence given by Sir Richard Redmayne with regard to alleged waste and the reduction in the cost of working coal under united effort. I am inclined to think that, as is usually the case, he has taken advantage on the credit side of all economies, but has not set off on the debit side the losses, as, for example, interest and sinking fund on expenditure. It must be borne in mind that all capital has to be got back during the lifetime of the mine, and in many old mines nearing exhaustion it would not pay to put in expensive plant now. In recent developments he admits that there is a great advance.

10. That iron and steel masters using great quantities of fuel require coal of special quality suitable for their purpose, and hence many of them have their own collieries. If these collieries pass out of their control they will have no certainty of having the quality of coal which they require, or, indeed, of getting the supplies they need. In these cases great injury might be inflicted on such manufacturers without any compensation therefor. Some of the miners' advocates seem to consider coal is of one description only, whereas it varies greatly even in different parts of the same seam, some descriptions being suitable for one purpose and some for another.

11. That the position of managers, and in many cases their income, depends on the successful organisation and administration of the undertakings they manage, each manager having to make his own concern a success, to the advantage of the public as well as of the shareholders. In practice it is very exceptional that a trade can continuously make an excessive profit while the application of capital to it is free, because high profits draw more capital to it and competition reduces profits.

The Government have already, as regards railways, converted an annual profit of 47 millions to an annual loss of 100 millions. They now propose to convert

an annual profit of 20 millions from the coal trade into an annual loss of 40 millions, which can always be easily done by limiting the value of the product of the industry and by forcing up the cost of production. Payment to owners of the property of its pre-war value by securities based on losses, instead of profits, from an industry seem to me to be a Gilbertian farce, and in the absence of full payment of value *bona fide* and honestly ascertained the State is merely a combined organisation for the wrongful conversion of the property of individual members of it. The credit of such a State must be impaired.

Railway Wagons.

On the question of waste as regards railway wagons, complaint has been made by those advocating nationalisation that there has been waste through owners having private wagons which are returned empty. Seeing that by the Rates and Charges Order Confirmation Acts 1891 of the railway companies it is provided that the companies shall not be bound to provide trucks for the conveyance of Class A merchandise (and coal is Class A) how could the colliery owners do otherwise than provide their own trucks? And in what respect is the complaint against mine owners justified? If any cause of complaint exists it would appear to be against Parliament, though there are grounds for private ownership of trucks. Complaint is made by advocates of nationalisation that by-product plants are not practically universal and as showing want of initiative on the part of the colliery owner. They are regardless of the fact that a great deal of coal will not coke—none of Lord Dudley's coal will coke, and unless coal will coke it is not practicable to use it for by-products. Lord Dudley consumes some 60,000 tons of coke annually, and I feel sure would give a very large sum to any one who could find out how to make coke suitable for blast-furnaces from his coal. With respect to by-products used for the purposes of war like those necessary for production of high explosives the Government refused to prepare for war and there was no market for such products in this country, nor any object in experimenting in that for which there was no market. On the other hand, Germany did prepare for war, and therefore provided themselves with material for which they knew the use they could put it to.

Housing.

With respect to housing, when mining in the South Staffordshire district began to be largely developed at the commencement of the nineteenth century, large numbers of colliers were permitted to erect cottages and improve land by making gardens on the then Earl of Dudley's land on payment of a very small rent. When John William Earl of Dudley died in the year 1833, he by his will left the estates to his cousin, the late Earl of Dudley, as tenant for life, the estates being strictly settled. Seeing that the cottages had been erected by the miners on the estates, and as the Trustees of the Will had no power to sell or deal with these houses at less than the improved value, they applied in the year 1847 to Parliament for power to sell to the occupiers at a price which would not include the value of any buildings or improvements, to pay compensation to any persons too poor or unwilling to purchase, and an Act was passed enabling the Trustees to sell at such prices as they might think fair but not at less than two years' purchase of the improved values of the property, and in their discretion to pay compensation for improvements to occupiers who did not purchase, the Act creating no trust for the benefit of the tenants. At that time (1847) there were about 2,000 such occupiers, about half of whom have at various times since the passing of the Act purchased their holdings under its provisions, and there are now about 800 tenants who hold land originally subject to the provisions of the Act and who are still charged for rent but little more than the rental value of the bare site, being at the average rate of between £4 and £5 an acre for the land occupied, including the houses and buildings thereon. Under the aforesaid conditions repairs are done by the occupiers. Some of the tenants have the enjoyment of more than one house. The Estate Office pays all the rates, including

8 May, 1919.]

MR. JOHN TRYON.

[Continued.]

water-rate, the cottage tenant repaying with the rent the rates paid on his behalf. On the death of a tenant it is the practice to give some member of the family the enjoyment of his holding, one who had taken care of an aged father or mother being generally chosen. The occupiers are not in any way limited to persons engaged in collieries or to persons in the employ of the Earl of Dudley.

When the Baggeridge Colliery began to be opened the question of housing was fully considered, and it was felt that it should be open to persons engaged in the provision of houses, such as builders, to provide them. The district is a populous one, and with industries on a large scale of many descriptions employing much labour. In fact the owner did not wish to compete unduly with the general public in supplying the demand for houses, while he was ready to provide the land. When it appeared that there was no inclination on the part of others to build, it was proposed to the colliery workers that they might form a company in which they would be shareholders, for the erection of houses with gardens to them, in which case Lord Dudley would let them land for a long term at a very small rent, and that two-thirds at least of the Directors should be workmen engaged at the colliery so that they might have the control, the remainder of the Board being representatives of management to assist in providing the necessary finance and give the Board the benefit of their experience, but the scheme was not accepted. It had been hoped that the proposal would encourage thrift and give the men a personal interest in the welfare of the concern."

15,555. *Chairman*: When was it that the Baggeridge Colliery was opened?—It began to be sunk in about 1900, and about 1911 it began to work. There were a great many roads to be made, and many things to be done. The Baggeridge Company was formed in 1911, and it was about 1912 or 1913, just before the war, that this proposal was made. It had nothing to do with the present housing schemes.

"A great difficulty with respect to the provision of houses arises from the fact that the Miners' Federation are opposed to what may be termed tied houses—that is, that the right of occupation shall depend on continuance of employment by their owner. I do not quarrel with the views of the miners, but it is obvious that if occupation and employment do not coincide the owner may, after having erected the houses, be again placed in the position of his workers being without houses, especially in a district where the industries are varied and there is competition for houses. It was partly on account of this difficulty that the proposal which would practically make the colliers their own landlords was put before them. When there has appeared to be any demand for land for the erection of houses, areas have been offered for sale by auction in suitable plots, and many sales have been made privately.

Accidents.

With reference to accidents in the mines, for very many years before the passing of the Employers' Liability Act there was a fund guaranteed by the owner, and to which he contributed more than half, to provide for compensation in every case of accident, the fund being administered by a committee of the miners. On the passing of the Employers' Liability Act the miners on the estate contracted out of the Act, preferring the benefits to which they were entitled under the then existing arrangements.

Of course, with regard to the Workmen's Compensation Act, we went under the Workmen's Compensation Act.

15,556. *Chairman*: You contracted out of that Act. I think there was a decision on that in 1893?—Yes.

"It has been suggested that it lies with the royalty and colliery owners to put forward some alternative scheme to nationalisation. I submit that the onus of proof that such a change would be of public benefit lies with those who demand it, and at present I know of no such proof.

Wages.

With regard to the division of the profits of the industry between capital and labour, there has for 40 years and more been a sliding scale of wages based

on prices. I see no objection to such sliding scale being based on profits, but I think that course would be prejudicial to the worker. The profits of a mine may be reduced, for example, by the necessity of pumping, while the selling price would not be reduced. There would be no reduction in average selling price, but there would be a reduction in average profits.

Valuation.

In the event of purchase of mines by the State, it is obvious that every colliery and royalty owner's interest would have to be the subject of separate valuation, but this is a question respecting which mining engineers are conversant and will give evidence, and therefore I do not deal with it."

The Chairman: Thank you, Mr. Tryon.

The Witness: May I say before I am cross-examined that there are one or two points that I want to add on account of what I have heard here?

15,557. *The Chairman*: Yes, will you do so?—One point was with respect to commons, because Lord Dudley is the owner of a considerable area of minerals under commons which have been enclosed and the Preamble to the Act of Parliament (24 Geo. III. 1784) for the enclosure is this: "And whereas the Right Honourable John Viscount Dudley and Ward"—they were Viscounts then—"is lord of the manor of the borough and foreign of Dudley aforesaid, and as such is entitled to the soil of the said commons waste lands and commonable places and to the royalties within the said manor or parish"—that is a true and accurate representation of the law. The soil of the commons never belonged to any member of the public who, as such, had no interest in it whatever. It was originally absolutely in the ownership of the lord. The lord, when he parcelled out his estate, kept so much demesne for himself, but sub-fued certain parts of the estate to freeholders, and he sub-fued certain parts of the estate—or at least did not sub-feu them, but he granted the occupation of certain parts of the estates to copyholders who were tenants who were at the will of the lord of the manor and part of the land was appropriated, the soil being in the lord, for certain benefits which the commoners had over the surface. Those rights varied according to the custom of every individual manor. Some had common of turbary (the right of cutting turf); others had estovers (the right of having wood or gorse); others had the right of putting sheep on them. These rights were generally and broadly speaking limited to the tenants of the lord of the manor, so that the ownership of the whole thing was limited to the ownership of the lord and his tenants. Then it being found, or Parliament considering, and both sides agreeing, in the latter part of the 18th century, that a great deal of this land was going to very little use, Parliamentary bargains were made between the lords and the commoners having these limited rights, to the effect that, instead of the commoners having an undivided right, not in the soil, but in what you may call the produce of the surface, they should have a defined portion of the surface subject to such rights as the enclosure Act might give to the lord, or provide that the lord should retain (not give to him, but allow him to retain) his ownership of the soil below the surface—in other words the minerals. For instance, in the case of the enclosure of Dudley, it being well known and it having been so for 100 years before the passing of the Enclosure Act, that there were mines, and it not being the intention of the legislature that the right of working those mines should be taken away to the injury either of the public, because the public wanted to consume them, or of the lord, it was provided that, "nothing in this Act contained shall prejudice or defeat the right or interest of the said Lord Viscount Dudley and Ward or the lord or lords of the manor of Dudley aforesaid for the time being of his or their lessee or lessees, in and to all mines of coals, ironstone, limestone, glass house pot clay, fire-brick clay and all other mines and minerals whatsoever except common brick-clay and common freestone and rubble or rotch stone, in or under the said commons, waste lands and commonable places but he and they shall, and may from time to time, and at all times hereafter, have, hold, enjoy

8 May, 1919.]

MR. JOHN TRYON.

[Continued.]

raise, get, take and carry away all such mines and minerals as aforesaid, as fully and effectually to all intents and purposes as he or they might or ought to have held and enjoyed the same before the passing of this Act, or in case the same had never been made, and for that purpose to use all pits already sunk down in any of the said lands and grounds and all gins, engines and buildings thereon erected or standing, together with full and free liberty, power and authority to and for the said Lord Viscount Dudley and Ward and the lord or lords of the said manor for the time being and his and their lessees and his and their agents, servants, colliers, minors and workmen to dig and get clay for making and burning of bricks, tiles, gutters and cress in and upon the said lands and grounds for the use of any colliery or coalwork now open or hereafter to be opened and worked, or for repairing any old or erecting any new buildings which may be requisite and necessary for carrying on working, raising and getting such mines and minerals and to bore, dig and delve for such mines and minerals, and from time to time to sink any number of pit or pits which shall be thought necessary." Then there is a proviso that whereas great damage would be done to the allottees by the exercising of these rights there was to be a subscription to a common fund from all the persons to whom the laws were allotted so as to make good the loss. Now that was the principle of the Act, and that is the law. You may alter the law, but I venture to say it is perfectly idle in these days to talk about a doubt as to the law. I have read the cross-examination of Lord Durham by Mr. Smillie, and he read a passage out of Williams, but the charming thing was that he did not realise the meaning of the word "estate." Of course, the King is the ultimate owner, but it is subject to "estate," and the estate which the King gave was an indefeasible estate in inheritance free from charge and encumbrance, which the King has no authority or prerogative to take away. He tried to take it away through his servants the other day in the case of the Royal De Keyser's Hotel, under the Defence of the Realm Act, and the Courts held that he had no prerogative to do anything of the sort. The only rights left in the King are about two. One is if the owner dies without heirs and without having disposed of his estate effectually, then in that case it goes to the Crown, representing the State; it goes to the King nominally, as the last ultimate person to whom it could go. The other case is, in the case of attainder, as to which I am not sure whether it still exists, but certainly it did for an attainder for high treason, and I think it applies to high treason still, and if a man is convicted of high treason he may forfeit his lands.

15,558. *Chairman*: High treason is under the 1870 Act?—Yes. I am speaking from memory. There is no other right in the King any more than there is in any of the Commissioners here.

15,559. *Mr. Herbert Smith*: Wo may get a legal opinion to differ with yours?—I do not think you will.

15,560. *Chairman*: That is what you want to say as to commons?—Yes. There is one other point, and that is this. I think Mr. Herbert Smith made a remark yesterday to Mr. Gemmell, which was in connection with the large amount of coal being lost in South Staffordshire by reason of carelessness in connection with drainage, and he asked whether that was not a ground for nationalisation. Now as a matter of fact the mine owners in South Staffordshire have nothing to do with the drainage. The drainage of the mines in question (I know all about it and have been to Parliament about it) was under a statutory body created in the year 1873, and they got increased powers in the year 1878 for borrowing and they borrowed, as every statutory body does. Afterwards, in 1901, they got further powers of getting money, but at that time, being insolvent, a receiver was appointed on account of the bond-holders. Mr. Edmund Howl was receiver, and I do not wish to say a word against Mr. Howl as being careless, because I do not think he was. He was receiver and had to carry out these operations. In the year

1914 there was another Act of Parliament by which all the pumps were sold with the consent of the mortgagees by Parliamentary authority to the Birmingham Canal Navigations, who are very largely interested in the water supply, because it is just about the top of their canal, and being short of water they are enabled to pump. Now this is the statement in the schedule referred to in the South Staffordshire Mines Drainage Act, 1914: "Now it is hereby jointly and severally agreed between the Commissioners the Canal Company and the Loan Commissioners as follows: (1) The Canal Company will as from the 1st day of January, 1913, up to the purchase of the fee simple of the freehold and leasehold hereditaments easements water pipes pumps and machinery specified in the schedule hereto (hereinafter referred to as 'the scheduled pumping stations') pay to the Commissioners for all water pumped into the Birmingham Canal in the Tipton District by the Commissioners except water pumped at Park Lane into the Wolverhampton Level under the provisions of the recited agreement of the 31st day of March, 1905, during the continuance of that agreement at the rate of 9d. per lock of 25,000 gallons, subject to a maximum payment for water so pumped of £5,000 per annum. (2) The Commissioners shall sell and the Canal Company shall purchase for the sum of £20,000 and in the manner hereinafter provided the fee simple of the scheduled pumping stations." Then that money was to be paid by instalments. If the receipts of the Commissioners were insufficient, the Public Works Loan Commissioners were for a period of 10 years to make up the deficiency, and the whole business was to be carried on wholly apart from the mine owners in South Staffordshire. That Act was put on the Statute Book in 1914 and is in operation to-day.

15,561. Is that a private Act?—Yes, it is what you may call a private Act.

15,562. Will you let me see it?—Yes. (*Handing.*) It is not the King's Printer's copy. I went to the Law Society this morning to see the date it was passed, and it is in their library. I wish to say that the circumstances attaching to that Commission were these: The mines are very shallow and the seams in the Tipton District were 30 feet thick and upwards; that it is impossible to get that coal without causing great fissures in the surface; that there are numerous canals and watercourses on the surface; that there is a drainage rate paid of a 1d. a ton by every mine-owner on practically the whole of the South Staffordshire coalfield towards keeping the surface in order; that there is a rate of up to 9d. a ton on coal raised in the Tipton District for providing cost of pumping; but last year things happened for which I do not think the miners were responsible, there were 39 inches of rainfall against a normal 25 or 26 inches, and the pumps, owing to the war, could not be repaired which they were wont to be, and at last in the fifth year of the war the "lift" broke and it went down, and I do not think that the "lift" will ever be recovered. I have seen one of the directors of the Canal Company since to discuss what is to be done. To say there is negligence was, I venture to say, a cruel slander upon Mr. Edmund Howl, who did his very best in the war under most difficult circumstances when he could not get a priority certificate for keeping the pumps in order, and when the nation was crying out for every engineering work, and there was an extraordinary rainfall. I want to put that point perfectly clearly—that there was no blame on the South Staffordshire mine-owners in respect of that drainage scheme whatever.

15,563. Who are the Commissioners under the Act?—The Commissioners were the mine owners, but it was taken out of their hands by the bond-holders and the receiver, and the Public Works Loans Commissioners themselves have made an advance. The Tipton District, where this applied, is one of the oldest districts. It was about the best coal, but it has been worked for certainly 200 years. There is some coal we have tried to get out, and we have let people grub about to see what coal they can find,

8 May, 1919.]

MR. JOHN TRYON.

[Continued.]

paying a small royalty of say 10s. a week to see if they could get 20 or 30 tons of coal so as to prevent any coal being lost. We have let them do that.

15,564. Have you the South Staffordshire Act of 1873?—Yes.

15,565. If you will let me have it, I will read it to-night?—Yes. (*Same handed.*)

15,566. You have said a few words as to commons and as to drainage. Have you any other point that you want to add to your proof?—The only question is this. I have explained the reason why I am against nationalisation. I think from a national interest the security of the finance of this country is much more important for the poor than it is for anybody else in the world. Employment is absolutely necessary and essential to them; if we get our financial position wrong, while I may be a poor man, they will be starving. I do not care whether it is the State or who it is, but if once we get our financial position wrong (I think it is in a perilous condition myself) we shall be all of us vast sufferers—every one of us. The moment you attack one form of property you attack every form of property, and that is the danger.

15,567. *Mr. Robert Smillie:* You made a very emphatic statement during the course of your recent remarks, and said that the miners were not responsible for the heavy rainfall. Are you quite sure of that?—I feel quite sure of that.

15,568. You give some reasons against nationalisation?—Yes.

15,569. Have you any reasons at all which you can give in favour of nationalisation?—I confess candidly that I look upon England as having been the greatest nation in the world by the individuality of not only the big men in it, but what you may call the little men in it—the workers as well as employers. For instance, I am a director, as you may have noticed, of steelworks. In talking to our works manager one day, I said to him: "Which do you prefer—a German workman or an English workman?" He said: "An English workman a hundred times. If we have a breakdown, there are half-a-dozen English workmen, each seeing what suggestion he can make. Some of them are foolish, but someone makes a good suggestion, and you adopt it and you get out of the difficulty. A German will stand with his hands behind his back and in effect say, "I await orders from my superior officer." I think it is this attitude of mind that has made England what it is in the past, and it is that which I want to preserve.

15,570. When you say "English"—?—Or Scotland, too. I beg your pardon. I do not want to go out to Scotland.

15,571. And the Irish and the Welsh come in and do a bit of work?—Yes, of course; I meant British.

15,572. As a matter of fact you have rather a high opinion of the British workman?—I have, and I do not want him to go down.

15,573. You know the eminence which this country has reached under private ownership. Is it possible for you to know what it might have reached had it had an opportunity of working correctly in another direction?—I am not going to say, because I cannot speak positively, and it must be a matter of opinion, but what I do say is that I do not think human nature is good enough to-day. (I do not think we are good enough) for what you are seeking. If the time comes when we are all prepared to say not only what we demand but what we refuse to accept as being too much to accept—when the world has come to that—then I shall think differently of the condition of things altogether.

15,574. We are a long way from that yet?—I think that the natural reward of real industry is acquisition. I do not think it gives much happiness, but that is the natural reward and if you take away the stimulus I think you will gradually sink. Take a young fellow: If he does not get promotion at a certain pace, and if he is ambitious, he is very apt to lose patience and become a dead failure, whereas there is all the promise you could want.

15,575. Now let us see. You have given an explanation here about a central pumping authority being set up?—Yes.

15,576. Various mine owners or owners of the royalties contributed to a common fund for the common drainage, did they not?—Yes.

15,577. Supposing they had not done so, would not a large portion of the Staffordshire coalfield have been shut down previously to that? One owner could not have kept out the water: is not that so?—There are certain cases where combination is advisable. That does not say that combination is advisable in all cases. It may be in limited areas and to limited amounts, but I am not enamoured of very big schemes.

15,578. In this case, is it not a fact that the combination of a number of persons who paid into the common funds for common drainage saved a large proportion of the coal which would not have been otherwise secured?—I am not quite sure it would not have done better without the drainage scheme and if there had not been a combination.

15,579. Do you mean some particular employer would have pumped the water out and kept it going?—We have non-statutory arrangements to-day. For instance, at this present moment Lord Dudley has a certain engine for pumping (not in this Tipton district, but in another district) which pumps, and for which people voluntarily pay him a certain amount, because it relieves their mines as well as his own. Of course, union is strength in the world, I agree, in certain cases.

15,580. Would you let us confine ourselves to that? Does it make any difference whether it is statutory or done voluntarily? The point really is that one employer may not be able to expend money on pumping all the water?—I quite agree.

15,581. But by banding together, it would make it possible that all could work their pits?—Yes.

15,582. Now an extension of that would be if the mines were nationalised; and that there were a central pumping station and the water drained as far as possible?—Before you put a central pumping station up, you have to find out whether you will be able to get coal and be able to keep down the water. If you get 39 or 40 inches of rainfall and the barriers are broken and that sort of thing, great harm may be done because, of course, it is enormously easier to pump water from the 100 level than it is from the 400 level. It is an infinitesimal part of the case. When I hear people talking so glibly about barriers being taken away, I want to know what the water conditions are. With us the most vital thing in the world is the barriers.

15,583. Are you aware that the pumping machinery that has broken down during the war was long out of date, and it ought to have been replaced long ago with new machinery, and that that was proposed and they could not get the people to contribute to it?—This was the position: The bond-holders had taken possession.

15,584. *Mr. R. W. Cooper:* You explained to us in the beginning your view with regard to the English law of real property. I suppose we are all agreed that the late Mr. Joshua Williams was a somewhat eminent authority?—Yes.

15,585. And his son, Mr. Cyprian Williams, is now one of the conveyancing counsel to the Court and is also a great authority?—Yes.

15,586. I do not know whether the Commission desire to go into this or whether they desire to call Mr. Cyprian Williams to tell us what the law is, but I have marked certain passages in a book,* and I will ask you to read them to us?—At page 6 it says: "An English subject may enjoy the absolute ownership of goods, but not of land. The law does not recognise absolute ownership of land, unless in the hands of the Crown; and the greatest interest in land which a subject can have is an estate in fee simple, that is to say, an estate inheritable by his blood relations,

* "Williams on Real Property," 22nd Edition.

8 May, 1919.]

MR. JOHN TRYON.

[Continued.]

collateral as well as lineal, according to the legal order of succession, and held feudally of some lord by some kind of service. For by English law the King is the supreme owner, or lord paramount, of every parcel of land in the realm; and all land is holden of some lord or other, and either immediately or mediately of the King. But it must not be supposed, because an English subject can have no absolute, interminable and underived ownership of land, that proprietary rights in land are unknown to the law. On the contrary, the law secures to every one, who holds an estate in land, the exclusive enjoyment of his holding, and gives him the right to maintain or recover possession thereof against all others. To an estate in fee simple there are, moreover, now incident the rights of free enjoyment and free disposition; so that such an estate is well-nigh equivalent to absolute property. It is common to speak of landowners and the ownership of land; and such expressions are found even in Acts of Parliament." At page 12 it says: "To restate in words more indicative of its origin the distinction that one may be the absolute owner of goods but can at most hold an estate in fee in land:—By English law movable goods are the object of absolute ownership; but land is the object of tenure, that is, feudal tenure. Tenure may perhaps be defined as the relation between feudal lord and tenant of land. The principle of the feudal tenure of land was definitely established in our law after the Norman Conquest. It is well known that after the battle of Hastings the lands of those who opposed the Conqueror were treated as forfeited, and were granted by him to his own followers; while those of the English who submitted to him redeemed their lands, surrendering them and receiving them again from his hands. In consequence of the revolts against William's authority, which took place in the

first ten years of his reign, further forfeitures were incurred; so that, by a gradual process of confiscation and new grant, Normans were largely substituted for English, as the chief landowners over the whole kingdom. Now according to the construction placed by King William and his officers of justice upon the grants or re-grants of land made by the King, whether to his own followers or to the former owners, the lands were not bestowed as absolute gifts but were granted on the conditions of what is known as the feudal system of landholding. That is to say, the grantees were regarded as holding the lands of the King as lord on the obligation of fidelity and service to him, in which if they failed the lands would be forfeited and the King might resume them as his own. The service required of the grantees would in general be military service; that is, each would be bound to provide the King with a certain number of armed horsemen or knights as part of the feudal host." At page 26 it says: "Payment for services was no longer made in terms of land, but in money. Tenure, the relation between feudal landlord and tenant, while remaining in form, had greatly diminished in real importance; the freeholders of land had, in fact, secured all the advantages of absolute ownership except the form. By an Act passed at the restoration of King Charles II. military tenures had been finally abolished; a measure which relieved freeholders from all the oppressive incidents of feudal tenure and reduced to a minimum the interests of lords in their freeholding tenants' lands. The same Act, too, extended to landowners generally the full liberty of disposing of their fees by will, a privilege before enjoyed only by the more favoured classes among them, though free power of alienation *inter vivos* had been much earlier obtained." I think the law is without argument.

(The Witness withdrew.)

Adjourned to to-morrow morning at 10.30.

SECOND STAGE—TENTH DAY.

FRIDAY, 9th MAY, 1919.

PRESENT:

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. R. W. COOPER.

SIR ARTHUR DUCKHAM.

MR. FRANK HODGES.

SIR LEO CHIOZZA MONEY.

SIR ADAM NIMMO.

MR. ROBERT SMILLIE.

SIR ALLAN M. SMITH.

MR. HERBERT SMITH.

MR. R. H. TAWNEY.

MR. SIDNEY WEBB.

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE (*Assessor*).MR. ARNOLD D. McNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

Chairman: Gentlemen, I promised to make an announcement from time to time as to the class of witnesses that we should call. After hearing Lord Tredegar and Lord Bute this morning, we shall go on with the royalty owner witnesses who belong to Mr. Pawsey's Association. The Commission will either adjourn altogether at lunch to-day or at 3 o'clock this afternoon, in order that they may deliberate in private upon the evidence already given. After the witnesses of the Royalty Owners' Associa-

tion are called (I do not think we shall finish them all to-day) we shall call one witness representing the pioneer or boring companies which bore for coal in undeveloped coalfields. The next set of witnesses will be a number of witnesses from the Home Office as to health and safety in mines. Following those witnesses, and I hope somewhere about Thursday next, we shall call some Colonial witnesses and other witnesses to speak as to nationalisation or State ownership in the Colonies and abroad. Then towards

9 May, 1919.]

THE RT. HON. COURTNEY CHARLES EVAN, LORD TREDEGAR.

[Continued.]

the end of next week we shall call two distinguished gentlemen to deal with mechanical and electrical improvements in mines. On Tuesday week we shall take the case of the coal owners, and we shall hear from them their ideas and suggestions as to the future of the industry. That will be our programme for the next fortnight. I will now call Lord Tredegar.

Sir L. Chiozza Money: Sir, Sir Allan Smith was good enough to say that he would at a future date

continue his cross-examination of me, which was postponed. I should like, if possible, that that could be taken to-day, because I have some papers which I do not want to keep continually here, and which should be in a safe place. If he could cross-examine me to-day, I should be obliged. Of course, I do not mind postponing it if he wants to get up his case.

Chairman: Perhaps you will ask him privately.

Sir L. Chiozza Money: Yes.

The Rt. Hon. COURTNEY CHARLES EVAN, LORD TREDEGAR, Sworn and Examined.

15,587. *Chairman:* This is the *précis* of the evidence of Lord Tredegar:—

"1. My estates in which there are minerals are situate in the Counties of Monmouth, Glamorgan and Brecon, and my residences are at Tredegar Park in Monmouthshire and Ruperra Castle in Glamorganshire.

2. I succeeded to the Tredegar Settled Estates in 1913 on the death of my uncle, the late Viscount Tredegar.

3. The approximate area of my estates in the above three counties is 32,000 acres in Monmouthshire, 7,000 acres in Glamorganshire, and 43,000 acres in Breconshire, most of which consists of waste or common lands of the Lordship of Brecon. Of these areas only about 12,500 acres in Monmouthshire, 2,500 acres in Glamorganshire, and 3,800 acres in Breconshire contain coal.

4. I am confining my evidence to coal, as the other minerals worked from my estates are insignificant in quantity and value. I am quite unable to give the total output of coal from my estates, but on investigation I have ascertained that the average output of the estates in the three counties during the 6 years ending 31st December, 1918, was 3,564,500 tons of coal per annum.

5. The average royalty received by me on coal during the 6 years ending 31st December, 1918, was 4-997d. per imperial ton.

6. All the royalties payable to me are calculated on a fixed tonnage basis, and there is no case on my estate of royalties being calculated on a sliding scale dependent on the selling price of coal.

7. The average annual income received by me in respect of royalties and dead rents on coal for the 6 years ending 31st December, 1918, after allowing for concessions, was £74,397, and the average receipts in respect of wayleaves were £9,430.

8. It would be impossible on such short notice to go into the exact nature of the origin of my titles to my various estates, but they may roughly be divided under three heads: The first lands, which have been in the possession of my family from time immemorial, probably long before the Norman Conquest; secondly the purchase by my ancestors from the Earls of Pembroke and Montgomery of the Lordship Marcher of Wentloog (including Machon) in 1710, and the Lordship Marcher of Brecon in 1639; and thirdly the innumerable small purchases made by my predecessors in title.

9. For the development of the minerals on the Tredegar estate in Monmouthshire my predecessors have spent very large sums of money in the construction of railways and docks. My great-grandfather, Sir Charles Morgan, was largely instrumental in promoting the Sirhowy and Monmouthshire Railways, the former of which is now owned by the L. & N. W. Railway, and the latter by the G.W. Railway. My grandfather, the first Lord Tredegar, and my uncle, the late Lord Tredegar, were the chief promoters of the Alexandra Docks at Newport, and they between them have invested over £1,000,000 in cash in the construction of these docks on which a very inadequate return has so far been received. These docks, like the Sirhowy and Monmouthshire Railways, were intended principally for the development of the coal in Monmouthshire and have been very largely instrumental in facilitating the output of that coal.

10. Questions have been asked before this Commission by, I believe, Mr. Smillie and Mr. Tawney with regard to my Tredegar Park Milo Railway.

Every statement contained in those questions is incorrect and misleading, and founded on an entire misapprehension of the facts.

No wayleave whatever is charged on traffic passing over the Tredegar Park Mile Railway.

This railway has been constructed by my predecessors in title under statutory powers, and has ever since been repaired, maintained and renewed by the owner for the time being of the Tredegar estates, and in respect of it I am in the position of a statutory railway company, and am simply entitled, under various Acts of Parliament, to charge the company using my railway road tolls on the same basis as any other railway company charges a railway company having running powers over its railway."

15,588. *Mr. Frank Hodges (to the Witness):* Is your family in any way associated with the Herbert family?—There are several Herbert families. Which Herbert family do you mean?

15,589. I mean the family the founder of which is described as Sir William Herbert?—My family was connected with the Herberts of Clytha. That is the only Herbert I can recollect at the moment that my family is connected with. We have had a good many connections in our time, and Herbert of Clytha, I think, married one of my ancestors, so far as I remember.

15,590. You have not read the records, I suppose, which would indicate that your family was connected with the family of Sir William Herbert, who was a trustee under the will of King Henry VIII.?—No, I have no recollection of that.

15,591. You do not deny it, I suppose?—No.

15,592. Do you know the history of the transfer of property in that period?—No, I cannot say that I do.

15,593. You cannot give us any information as to what is described by the archivists as the Herbert Grant?—No, I cannot. I was asked to give information and evidence with regard to my property. I know nothing about the Herbert property. I can only give you evidence on the property which I own.

15,594. I am trying to get to that paragraph in the evidence in which you state: "It would be impossible on such short notice to go into the exact nature of the origin of my titles to my various estates." Have you ever heard of a document known as the Herbert Grant?—Never.

15,595. Do you know that King Henry VIII. appointed trustees to administer his will?—No, but I suppose he did—most people do.

15,596. I suppose you do know who was the successor of Henry VIII.?—No, I do not.

15,597. Was it not King Edward VI.?—At present I have forgotten. I am not a very good historian.

15,598. Our memory of these things wants a little burnishing up no doubt. I think we must accept it as a fact that Edward VI. was the son of Henry VIII., and that he was born in 1537, and that he only reigned for 6½ years. He was described as "the Boy Prince," and there is on record a document which proves (I put this to you, because I feel sure you have had it brought to your notice) that Sir William Herbert obtained a grant of land in Glamorganshire, in Usk, in Builth, in Cardiff, in Breconshire, and in Radnorshire, which is alleged to be signed by Edward VI. when he was ten years old. I have a copy of that grant in my hand, and you can get a copy from the Recorder in the Cardiff Museum.

9 May, 1919.]

THE RT. HON. COURTNEY CHARLES EVAN, LORD TREDEGAR.

[Continued.]

Mr. Arthur Balfour: Can we have that document put in?

Mr. Frank Hodges: Yes. I am going to ask in one moment that it shall be reprinted for the benefit of the Commission." For the moment I am quoting from the grant. It is described as "R.O. Patent Rolls, 4 Edward VI., Part IX, 7th May, 1551." I should like to ask that it be printed. I believe it is one of those documents still extant which shows how these lands were transferred in that period.

Chairman: Certainly. If you will give me a note of it at the adjournment, I will get it; it probably has been reprinted.

15,599. Mr. Frank Hodges: Yes. At present the original is in the hands of Mr. Wheatley, the Town Clerk of Cardiff, who might, if necessary, be subpoenaed to produce it. (To the Witness:) I am going to refer to a paragraph in this to see if you can recognise anything of the lordships referred to in the Usk Valley and Usk as being your property?—I do not own anything in the Valley of Usk at all.

15,600. I am going to ask you if you own any of the properties described as follows: The Manor of Usk, Usk Castle, the Lordships and Manors of Trellick and Caerleon?—I own a few houses in Caerleon—a farm I think it is. I would not be sure how much it is; but it is not very much.

15,601. Do you know the title of your holdings there?—No.

15,602. Have you enquired as to how you came by that?—No.

Mr. Evan Williams: May I suggest that as there is no coal in the Usk Valley this question is not relevant?

Mr. Frank Hodges: The relevancy of it will appear as we go along.

The Witness: May I add something which I have been told by my solicitor, namely, that the Manor of Caerleon was purchased from the Duke of Beaufort by my family about 10 years ago? I wish to say that I have not been able to go into all my family history since I succeeded. I only succeeded in 1913, and I have served for 4½ years in the war, and one has had something rather more important to do in that time than to go into family history, so that I am very rusty on the point of family history.

15,603. Would you say that paragraph 8 of your *précis* is equally rusty?—Very likely.

15,604. Apparently you have gone back to ascertain the title before the Norman Conquest?—Certainly.

15,605. I take it that that paragraph was set there by your legal adviser?—Certainly it was.

15,606. The reason I ask that question is that apparently you have not recently had time to study the history of your title?—That is quite true.

15,607. Do you own any property in Glamorgan-shire?—Yes.

15,608. Has that been purchased from the Duke of Beaufort?—No, not to my knowledge.

15,609. Have you yourself examined or caused to be examined your title to the minerals in what is known as the Tredegar Estate?—No, I have not examined the old deeds lately.

15,610. Have you satisfied yourself that they were purchased by your ancestors from another family?—I am perfectly satisfied they were. If they were not purchased and they were not my property under the present English law, some one would have already come forward and claimed them.

15,611. Not necessarily, because I have this document before me which shows that the tremendous tracts of territory in Monmouthshire, Glamorgan-shire and Breconshire were never purchased at all?—Some of my land of course was never purchased—the land we are alluding to before the Norman Conquest, which, I admit, I cannot trace for the moment; but I am sure there would be someone else who would have traced it if it were not mine.

15,612. I wish you had supplied to the Commission in your *précis* a little more in detail answers to the questions set out by our Secretary, because then one could have compared your existing holdings with what are described as properties under this charter.

A witness who will be called has set them forth very fully. Would it not be possible for you to set forth your holdings and show your title as previous witnesses have done, and, as I say, a subsequent witness proposes to do, showing when you came into the properties and whether they were purchased or not purchased?—That is quite easy, and it can be done. Of course it takes a little time. So far as I know, we have all the deeds which anyone can possibly have. There are a great many of them which are in dog Latin. I do not know whether you are an expert in dog Latin, but a great many are in dog Latin, and I am afraid, speaking for myself, that it would take me a long time to decipher them. But everything I have connected with my estate, if it is necessary for the Commission, is certainly at your disposal for examination.

15,613. If this Commission reported in favour of nationalising your minerals, and it also made a recommendation that you should be compensated for your existing holdings of minerals, would you claim a right to compensation, if you could not produce the title deed to a particular portion of it?—I do not propose at this moment at all to give my opinion as regards nationalisation. Although I must admit from the evidence I have read that I am strongly against nationalisation, yet I think I have the right, as a member of the House of Lords, to postpone any decision on the question of nationalisation until such a thing comes before the House of Lords in a Bill.

15,614. Let me put a rather simpler proposition. Supposing a man held property to which he could show no title in law, and the nation decided to sequestrate that property, would you say that man, as a principle, would be entitled to compensation?—Yes, if it is allowed by law. If it is not his property by law, of course he is not entitled to compensation. If the law of England to-day allows me to have property, I am entitled to compensation.

15,615. And no doubt you would pursue that opinion if such a Bill came before the House of Lords. You would oppose such a measure. Even if a man could not show a title to mineral property, if he claimed under the law that it was his property, apart from being able to show a title, you would take such steps as would adequately compensate him?—He must show a title. If it is not his property, he is not entitled to it. If under the law of the land, as I understand you, the man owns the property and the minerals underneath it by his title deed, then I say he is entitled to compensation.

15,616. But supposing he has no title deed?—Then he probably has not got the property; he cannot have it without.

15,617. It has been said here by the previous witness that if you hold something for twelve years you possess an inalienable right to it, whether you have deeds or titles or not?—That may be. That is a matter of law. I should prefer counsel's advice on that.

15,618. You know in South Wales there has been a considerable agitation in the past about the land, and so much so that there was a Land Commission set up some years ago. Do you remember that?—No, but there probably was.

15,619. There was a Land Commission set up, and that Commission failed to come to any useful conclusions because it had no authority to compel the production of documents and it could not compel witnesses to produce the titles to their property. Arising out of that were you made aware of a speech by Mr. Lloyd George on the subject of landlordism in South Wales?—Are you talking of ten years ago?

15,620. Yes, roughly?—I was not then the owner of the Tredegar property or anything to do with it. I was probably serving as a soldier somewhere. I do not recollect the thing at all. I did take interest in politics for a short period, but that is all. I am afraid I did not follow it and I do not know anything whatsoever about it.

15,621. Do you think from your experience that landlords in South Wales and mineral owners in South Wales have anything to their credit in the way of a creditable record in relation to the people?—I think so.

9 May, 1919.]

THE RT. HON. COURTNEY CHARLES EVAN, LORD TREDEGAR.

[Continued.]

15,622. Would you be surprised to find that Mr. Lloyd George in the year 1912 differed very violently from that view?—No, I should not be surprised.

15,623. Do you remember that the land question in the year 1912 in South Wales was a burning question?—No, I do not.

15,624. You were not, probably, aware of the current feeling, at least, in Welsh politics. At that time Mr. Lloyd George made a speech about South Wales landowners in Swansea in that year 1912, in June?—I am not aware of it.

15,625. I will read a quotation which might, as it is being read, sound rather familiar to you:—"It is trust property and we mean to examine the conditions of it. . . . Now we are seeking but our own. . . . In these South Wales valleys you have got hundreds of thousands a year paid in rents and ground rents and dead rents, and wayleaves and royalties and licences and fees, all of which I once called, and will call again, 'that black retinue of exactions'—who by? and by what right? Paid by men who risk their lives for it—paid by men who spend their days in dust and in darkness to win it. There is not a single day of their lives that they do not give two hours—two hours stolen from the sunshine, two hours of additional jeopardy to life—to pay these exactions. They come up to seek rest and restoration and they find crowded habitations—houses often unfit for human habitation. Landlordism has ground and oppressed them, so that when they come up, instead of finding renewed vigour and strength, they breed disease and degradation. The men whose wealth they make at the risk of their lives grudge them every inch of sunlight, air space, breathing ground. That is a trust that will be looked into."

Mr. R. W. Cooper: What is the date of that?

Mr. Frank Hodges: June 1st, 1912, in Swansea.

Mr. R. W. Cooper: What was the occasion?

Mr. Frank Hodges: The occasion was at the time when the revelations were brought to the notice of the public by the archivists of Cardiff Museum, who discovered the document which proved beyond all doubt how the property in South Wales passed.

Mr. R. W. Cooper: Whom was Mr. Lloyd George addressing?

Mr. Frank Hodges: The public in Swansea.

Mr. R. W. Cooper: Oh! it was some political meeting?

Mr. Frank Hodges: Yes, I presume it was a political meeting. That is not so very many years ago.

Mr. R. W. Cooper: It was when he was not in his present position of responsibility.

Mr. Frank Hodges: Yes, in 1912 he was in a position of responsibility.

Mr. R. W. Cooper: I said his present position of responsibility.

Mr. Frank Hodges: Well, he was Chancellor of the Exchequer at the time.

15,626. Would you agree that it would be a true statement of the affairs in South Wales?—Certainly not.

15,627. Do you think that anything has happened, even if it were true in 1912, to alter the relations between landlords and the workmen or mineral owners and the workmen since 1912?—No, I do not think so.

15,628. If that were true, would you think that the mineral owners should continue to hold such large tracts of minerals as are held in South Wales?—Yes, I think they should certainly continue to hold the mineral rights that they have.

15,629. Even if that statement of Mr. Lloyd George were true, they should continue to hold them?—Yes.

15,630. Sir Adam Nimmo: I understand from your *précis* that your ancestors have been in a special sense interested in the industrial development of your district?—Yes.

15,631. You mention that they have promoted railways and docks in order to bring about that development, and they have spent large sums on it?—Yes, they all have.

15,632. Over a long period?—Yes, over a long period.

15,633. May I ask you your opinion on this: But for this original enterprise on the part of your ancestors, would the district have been developed as it has been?—No, I should not think so. I do not think the facilities for getting coal would be as good as they are now.

15,634. The facilities would not be so good as they are now?—No, I should not think so.

15,635. So that the whole district as benefited largely from that individual enterprise?—I believe so.

15,636. Would it be your desire, in view of that situation, that this individual initiative should be continued?—Yes.

15,637. You go so far as to say that the prosperity of the country largely depended upon it?—Yes, I think so.

15,638. You have large mineral areas in your possession, have you not?—Yes.

15,639. Is it your opinion that you found individual effort sufficient to develop these minerals?—My experience, of course, has been very short, but I see nothing to doubt that individual effort has been very successful in that way.

15,640. Although your connection with your property may have been a short one, you have seen the fruits already of all the individual effort that has taken place?—I certainly have.

15,641. Do you consider that has been on a very big scale?—Yes.

15,642. Do you agree that the individual effort has been sufficient, so far as we have gone, adequately to develop the minerals in your district?—Yes, I think so.

15,643. Is it your view that any coal that is likely to be workable will be exhausted by the operation of that individual effort and initiative?—I should think so.

15,644. You have not any fear for the future in regard to individual enterprise fully developing any minerals that are still unworked?—No, not so far as I am concerned.

15,645. I suppose you would have the view, as a large mineral owner, that it is desirable in the interests of the nation that all coal should be worked that can possibly be worked?—Certainly.

15,646. And that no coal should be held up unreasonably and contrary to the national interest?—No, certainly it should not.

15,647. I suppose that if there were cases where coal was being held up in that way, you would agree that some form of machinery should be set up for setting it free?—Certainly.

15,648. And you would not object, as a mineral proprietor, to reasonable restrictions being put upon you to bring about that result?—Certainly not.

15,649. There might be a difference of view as to what the precise form of machinery might be, but you agree that some form of machinery ought to be adopted?—If it is found necessary.

15,650. And would you agree that that should be as simple and as direct a form of machinery as possible?—Yes.

15,651. Do you think we could get at the results which we desire to get at from the point of view of removing all obstacles for the working of coal by setting up some simple form of tribunal to which an appeal could be made either by individuals or corporations?—I do not think I can say that. I have not gone far enough into it. I should not like to say, but I should think you probably might.

15,652. Mr. Evan Williams: Has there been any reluctance on the part of yourself or your predecessors in providing land for building houses in South Wales?—Oh, none at all. We have always met in every way possible the building of houses. As you know probably, the building in colliery districts is certainly generally taken over by building clubs, which, I presume, consist in the mining districts of miners. They have their own particular pattern of house which they desire, and we have never on any occasion that I can remember ever refused land for building purposes.

9 May, 1919.]

THE RT. HON. COURTNEY CHARLES EVAN, LORD TREDEGAR.

[Continued.]

15,653. And these clubs are composed of the working miners at the collieries?—Yes. I could not tell you exactly, but they belong to the town, and I suppose they are all miners who have been thrifty and have saved money for building houses.

15,654. Do you make a stipulation as to the kind of house which is put up?—No; we often make suggestions, but we make no stipulations except that they must not be in a block of more than six houses. As a rule we recommend four semi-detached houses if they will put them up.

15,655. So that on your side there is no obstacle in providing plenty of fresh air?—In several cases lately there have been schemes for housing, and it was my wish, providing they put up a certain number of houses, to give them a certain amount of land free in order to provide air space and recreation.

15,656. The colliery companies have built a number of houses on your land for themselves, have they not?—I do not know so much about that. It is nearly all done by the District Councils and so forth.

15,657. Have you ever heard of any reluctance on the part of any other land owner to provide land for building houses?—No.

15,658. So that even Mr. Lloyd George is not in possession of all the facts when he makes speeches?—No, I am afraid not.

15,659. In paragraph 7 of your *précis* you say "after allowing for concessions"—what concessions do you refer to there?—There are various concessions from time to time where collieries perhaps are not doing very well, and it is necessary to make some concession or other to the colliery itself in order to promote the working of it.

15,660. It is a concession made to the colliery owners because they are in a difficulty?—Yes.

15,661. *Mr. R. W. Cooper*: Are these amounts of rent, the gross amount of your rent, subject to taxation?—Yes, the gross amount.

15,662. *Mr. Arthur Balfour*: Are you aware that undisturbed ownership of property in this country over twelve years creates a sufficient title?—No, I did not know that.

15,663. Do you know that in Scotland it is a longer period, 40 years?—No, I did not know.

15,664. Will you accept that from me?—Yes.

15,665. That being the case, do you think an examination of all these old titles is of any value to us whatsoever in considering whether the coal in this country should be worked nationally or in some other form?—I should not think so.

15,666. What purpose can be served by dragging out these old titles and examining them?—I do not know what purpose can be served in really keeping them, but I have to keep them under lock and key in a cellar and different places.

15,667. It would be rather useful to have them in case of compensation perhaps?—Yes.

15,668. On the other hand I pointed out to you there is such a thing as a possessory title when you have been in possession for 12 or 40 years?—Yes.

15,669. So that the only object in bringing up these titles is to arouse some prejudice in considering the situation: do you agree?—Yes.

15,670. Would you rather own your land on the basis of a legal title, that is, under the law of the land, or on the basis of some statement made by Mr. Lloyd George in a speech?—I think I prefer the legal title; I know where I am then.

15,671. You think his declaration might be very useful for getting votes but not for retaining the property?—Yes.

15,672. If this investigation has any value at all I take it that any miners' cottages that have been built or are in the possession of miners on property granted by charters which are questioned also ought to be confiscated?—Yes.

15,673. So that really you would break down the whole rights of property in this country and cause confusion, and Bolshevism, in other words. Do you agree?—Yes.

15,674. *Mr. Robert Smillie*: Did you say that you agreed with Mr. Balfour when he suggested that the questions asked about titles here were put for the

purpose of prejudicing the case? Did you say "yes" to that?—Prejudicing what?

15,675. Prejudicing the case that is before this Commission and that that was the purpose of asking for the titles?—Not the case of prejudicing nationalisation. I do not understand your question quite.

15,676. *Mr. Balfour* asked you: Do you not think that the questions being asked here as to the title are asked for the purpose of prejudicing the case for nationalisation? That was the question, and I think you agreed?—Oh yes, I do.

15,677. You agree that the miners' representatives here are deliberately asking you and others to produce the titles to their property in order to prejudice this Commission and the country against nationalisation?

Mr. Arthur Balfour: That is not the way in which I put it.

Mr. Robert Smillie: You put it in a way which, with all due respect, you had no right to put it.

Mr. Arthur Balfour: I had a perfect right to put it.

15,678. *Mr. Robert Smillie*: That is exactly the way you put it. (*To the Witness*.) The next question was, if we are entitled to ask for the titles of the land and failing their production we are entitled to confiscate the land, would we not be equally entitled to confiscate the cottages which had been built by miners with their own money?—If you are entitled to confiscate the land, you are entitled to confiscate everything, so far as I can see. You have to prove your title to it.

15,679. If you are entitled to confiscate land you are entitled to confiscate anything?—Yes, quite so.

15,680. I want to put it to you that it is quite possible for human effort, human brain and human hand to build cottages by quarrying the stone from the quarry, by cutting down timber, and by forming the timber; is that not so?—Quite so.

15,681. But is it possible for you or any other landlord in this country to create an inch of soil?—No, but we can develop it.

15,682. Development is not what we are talking about. Is it possible for you to create soil?—No, I do not suppose it is.

15,683. Is there not a wonderful difference between what can be created by human effort and confiscating something which the Creator made for the use of all people and which no one can reproduce? Is there not a great difference?—Yes, there is a great difference.

15,684. Would you reconsider your answer to the question, then, that you have as much right to confiscate the production of man's hand, brains and effort as you have to confiscate what the Creator made for the use of all men and which no one can reproduce? Do you still say you have as much right to confiscate the miner's whole life-savings in the cottage which he built as you have to confiscate the soil which neither Lord Tredegar or any one else ever did anything to produce? Is it on the same plane?—I say we have done a great deal to produce the output.

15,685. To produce the land?—To produce the land, no.

15,686. I will put my question again?—Very well.

15,687. I will put it so as to get a short answer. Is it on the same plane to confiscate the cottage built with the life-savings of a miner and built through his efforts as to confiscate the land which no landlord ever did anything to create? Is it on the same plane or level?—I do not think you should confiscate anything. I see no reason for confiscation in any case.

15,688. But surely you would be the last, as a legislator, to say that the State had not the right to do what the majority of the people of the State thought right to do. Are you aware that the landlords of this country and the House of Lords, who are not representative of the people, in the sense that they are not elected, have confiscated by law, passed in this House, millions of acres of land?—No, I am not aware that they have ever confiscated anything.

15,689. They have passed Acts of Parliament which have justified the title of people who had previously

9 May, 1919.]

THE RT. HON. COURTNEY CHARLES EVAN, LORD TREDEGAR.

[Continued.]

confiscated. Is that not aiding and abetting a theft?—I maintain they never confiscated anything or recommended it.

15,690. As a member of the House of Lords do you maintain that that House has never lent itself to the confiscation of public property?—I do.

15,691. Now let us turn to this wonderful Tredegar Park Mile Railway, in Wales. You say in your *précis* at paragraph 10: "Questions have been asked before this Commission by, I believe, Mr. Smillie and Mr. Tawney with regard to my Tredegar Park Mile Railway. Every statement contained in those questions is incorrect and misleading." That is your statement here?—Yes.

15,692. Let us see how far they are misleading. You say that your predecessors laid down that railway?—I do.

15,693. Am I right in saying it is a mile of railway?—It is one mile of railway. It is really six miles of line, because there are three double lines.

15,694. There is a very large output of coal that must come over that railway, is there not?—Quite true.

15,695. All the coal will be required to be left in unless it passes over that particular part of the railway?—No, it can be conveyed another way to Cardiff.

15,696. Are there any other railways by which the coal could be brought?—From certain districts there are.

15,697. I put it to you there is coal produced which must either remain at the colliery or come over that line of railway?—Probably so.

15,698. Is not that the condition at the present time?—That is the condition.

15,699. That the coal must be brought over that particular railway of yours or else remain at the pit?—Yes.

15,700. That means the industry there employed would be dislocated and stopped provided you cared to stop the right over your railway?—Yes.

15,701. That is to say, if you were to hold them up at any time to ransom and make them pay any price you care to?—I cannot make them pay any price I care to.

15,702. At the moment you cannot. I understand the drawing from the railway is £40,000 a year?—Then you understand entirely wrongly, and that is why I made that statement. Never since the railway was built has any owner of the Tredegar Estate ever received £20,000 a year—never.

15,703. Will you tell us now, to put us right?—I want to put you right.

15,704. I was quoting from a figure that has appeared again and again. If you will put the amount now and tell us the amount we will take you as an authority?—I am much obliged to you. I want to put you right straight away. There is no question of wayleaves over the railway at all. It is a railway company, the same as any other railway company, and my charges are governed by the Great Western Railway Company and other companies running over it. The charges that I am obliged to make by the agreement are precisely the same charges that they make one mile above and one mile below where this railway comes. You follow me?

15,705. Yes?—The charges are, to be correct, 563d. or something of a penny, whatever the ordinary charge is. It is under a halfpenny, anyhow.

15,706. I think I put it at a halfpenny?—You put it at a penny, as far as I remember.

15,707. I ultimately corrected that to one halfpenny and said £40,000?—That is why I put that in to show it was not the case.

15,708. I was including the amount per ton and the amount per annum. What approximately would be the amount per annum now?—The amount per annum I receive.

15,709. Yes?—£19,000.

15,710. That is less than half the sum that was reported?—Precisely; less than half the sum.

15,711. Do you know what it cost to lay that six miles of railway?—I think I can give it you. I think it cost £40,000—I am not sure; and if you would not

mind my mining agent giving you these technical points, it would be better. I am not absolutely certain.

15,712. £19,000 a year would be a very fair return, surely; or, at least, a non-fair return on £40,000?—I quite agree, a fair return.

15,713. You agree?—Yes, I do.

15,714. When you say that your charge was fixed largely, and by agreement largely on the basis charged by the railway company for hauling over their railway coal, I suppose we may take it they provide the engines?—Yes. The line is practically let to the Great Western Railway Company, do not you see, and they do all the haulage, but I do the repair and the maintenance.

15,715. You maintain that six miles of line?—I do.

15,716. You get rather less than a halfpenny per ton for all the material that goes over the line?—That is it.

15,717. For the erection of and the maintenance of that line?—That is it.

15,718. £19,000 a year is the average amount drawn on an expenditure of £40,000. Of course, the maintenance would have to be added to that?—Yes, that has to be added, and, of course, there are deductions in taxation; you will not forget that.

15,719. Quite. Do you really know how many Acts of Parliament have been passed between 1776 and 1867 affecting your holdings of land in 31 parishes; that is to say, the holdings of your family of land in 31 parishes in Wales?—I do not know how many Acts of Parliament. My solicitor, who is in the room, can probably give you that information.

15,720. You are Lord of the Manor of 26 manors in Monmouthshire?—Yes.

15,721. Have you 26 mansion houses?—I have not. I have two, and one is in a very bad state of repair.

15,722. We would like to help you to repair it. If it is insanitary it is bad for your family to live in. Do you know the Drim Mountain in Breconshire?—Yes.

15,723. Have you any connection with it? Do you take any minerals from under it, or a Lordship?—Yes, I do. That was purchased from the Earl of Pembroke and Monmouthshire in 1639; the whole of the Lordship of Brecon, I think it was.

15,724. Are you acquainted with the Ystradgynlais Parish Council?—Yes, I have heard of it.

15,725. I have a letter from the Clerk of that Council and they are very desirous that this Commission should ask Lord Tredegar to produce his title of the Drim Mountain; and especially the deeds appertaining to the royalties and the coal workings under the mountain. Is it possible you could oblige this Commission and also this Parish Council by doing that. They seem to be in doubt; they are your neighbours?—Drim Mountain is near the boundary and there has been in the past a law suit which was given in our favour. That was to do with a neighbouring tenant, and not to do with this particular Parish Council. All I can produce, as far as I know, is the title upon which this land was purchased from the Earl of Pembroke and Monmouthshire, who, I suppose, originally received it from the Crown—I do not know. All I can produce is that which would give the total area, and in that it is explained, I understand, there was a common and I have the right of working the minerals under that land.

15,726. I suppose this Parish Council may be looked upon as the custodians of the public rights at the moment in the parish?—Yes.

15,727. Do you think they have any reason to ask that your titles to the minerals under this Drim Mountain should be called for?—No, I do not think so.

15,728. You do not think they have?—No, I do not think so.

15,729. Is the surface of Drim Mountain common land or part of your manor?—It is common land.

15,730. You mean common land—the common ownership of the people?—I do not know that it is completely common land, but I am owner as Lord of

9 May, 1919]

THE RT. HON. COURTNEY CHARLES EVAN, LORD TREDEGAR.

[Continued.]

the Manor. The people have a common grazing right; that is to say, the tenants all round graze and pay no rent for it, and people, as far as I know, walk all over it. They have never been stopped. It is a good thing not to burn down the grass and heather, as that does damage to other people. It is not enclosed; it is a common and a very large area.

15,731. It is common in the sense that people have a free right of grazing or access?—Certain people have a free right. I will not say everybody has a free right of grazing.

15,732. Freeholders?—There are certain people who claim a right and have it to graze there, free of all rent.

15,733. You have not thought of preventing their doing so?—Oh dear no.

15,734. Would you be entitled to, do you think, if you made up your mind to do it?—I do not know. I take it there must be a deed which empowers them to do so. I do not know that I could prevent these tenants, even if so disposed.

15,735. You have never asked them to produce their title?—Never.

15,736. According to some people, if they were in possession of that for 12 years, they would not require a right?—Perhaps they do not; I do not know.

15,737. Mr. Balfour put it to you that titles are unnecessary as far as the Law of England is concerned, to justify possession, because if a person is in possession of a thing for 12 years you do not require a title. I think you said you were ignorant of that?—Yes, I did not know that.

15,738. You were not aware of the fact?—I was not.

15,739. You ought to pay a substantial fee to Mr. Balfour?—Yes, I think I ought.

15,740. Mr. Balfour immediately followed that by saying if you were asking for compensation the title deeds would be rather a handy thing to have in your possession?—Yes.

15,741. I think I can take it from you that you agree with him, and I think you did agree, if you ask for compensation title deeds would be rather a useful thing. The State would not be likely to compensate any person who could not show title deeds. The State would not be likely to pay compensation merely because a person could prove he was in possession for a number of years?—Very likely not. That is a point of law I do not know anything about. I should prefer to hang on to my title deeds until they are taken away from me.

15,742. I think it would be wise to. Your possessions, though not as extensive as some other

Welsh gentlemen, are very extensive in Monmouthshire and South Wales?—Yes.

15,743. I know your income from royalty rents and coal amounts to £59,000 a year over six years?—Yes.

15,744. You have been actively in the service of the country during the last four years?—4½ years during this war, and before for 20 years.

15,745. Were you connected with a Welsh Regiment?—No, I was not; I was a naval officer.

15,746. You are aware that a very large number of miners left the district round about where your possessions are?—Yes.

15,747. And acted, as you would expect them to do, very gallantly?—They did.

15,748. Do you think that it is altogether fair that those men should have been out there, and so given their lives for their country, and others coming back who have done their best should come back to a country where they have no possession of land, whereas you and many others possess many thousands of acres? Is that equitable and just for men who have made an equal sacrifice in the defence of the nation? In one case the common people have no land; in the other case it is held by the possessing classes. Is that fair?—I do not think that service for your country entitles you to land when you come back. I do not know that half the soldiers and sailors would want it if you gave it them.

15,749. You do not think that service for your country in war-time is a justification for expecting to get land for yourself. Would you believe that the largest number of landlords in this country claim that the land which they possess was given by the King for services rendered in war? You know that is a fact?—In some cases they have been; it is not all true.

15,750. Are you aware 100,000 acres or 200,000 acres have been granted by kings who had no right to grant it to persons who received it because of services rendered to the nation?—Yes.

15,751. Then why do you say that common people, colliers and other workers have no right to expect it?—I think if land is available, by all means let them have it.

15,752. It is only available providing it has been taken from you and those who possess it?—Is there any reason because I served in the war that I should have all my land taken from me?

15,753. I have no desire because you served in the war that you should lose your land. I desire there should be a more equitable distribution of land amongst those who served in the war?—I admit, with regard to those who did serve in the war, everything that possibly can be done should be done for them.

(The Witness withdrew.)

THE MOST HON. JOHN, MARQUIS OF BUTE, Sworn and Examined.

Chairman: I will read the *précis* of the evidence of The Most Hon. John, Marquis of Bute and Earl of Dumfries.

“1. *Acreage of holding of land and of the proved mineral rights.*

Land	123,582 acres.
Proved mineral rights	48,878 „

2. *Total output of coal and other minerals to date.*

I am informed that it is impossible to give this.

3. *The average annual output of coal and other minerals.*

This again is impossible, but in order to assist the Commission I have been supplied with particulars showing the average annual output of coal for the last six years (i.e., ending on the 31st December, 1918), which works out at 3,241,962 tons per annum.

4. *The Royalty payable per ton, whether fixed or on a Sliding Scale.*

Here again I take the same period of six years with the following results:—

(a) Fixed Royalties.

Payable on 85.31 per cent. of output.

Average Royalty (before deduction of Mineral Rights Duty, Increment Value Duty, Income and Super Tax), 6.42d.

(b) Sliding Scale Royalties.

Payable on 14.69 per cent. of output.

Average Royalty (before deduction of Excess Mineral Rights Duty, Mineral Rights Duty, Increment Value Duty, and Income and Super Tax), 1s. 5.92d.

(c) The average Royalty taking into consideration both fixed and sliding scale royalties (without making any of the before-mentioned deductions) is 8.14d.

5. *Average annual income received from mineral royalties and wayleaves* (without making any of the before-mentioned deductions).

For same period of six years.

From Royalties	£109,277
From Wayleaves	6,495

9 May, 1913.]

THE MOST HON. JOHN, MARQUIS OF BUTE.

[Continued.]

6. Nature of roots of title to mineral properties ...

Date.	Situation of Property.	Document.
1547—1 Ed. VI.	Manors of Miskin, Glynrhondda, Llantrisant and Pentrych and Clnn.	Grant to Sir Wm. Herbert.
1550—4 Ed. VI.	Manors of Rutbin, Senghennydd Upper and Lower and Rudry.	Do.
1792—29 Sept.	Tynywern, Parish of Eglwysilan.	Conveyance.
1793—11 Jan.	Manors of Llandough, Kibbor, Cogan, &c. Lands in Parishes of Llandough, Cogan, Penarth, Ystradyfodwg, &c.	Do.
1819—18 March	Lands at (amongst other places) Lavernock.	Do.
1819—10 Aug.	Maesbach, Parish of Llan-twit Fardre.	Do.
1825—5 Feb.	Craig Rhydney in the Parish of Gelligaer.	Do.
1826—4 April	Tymawr, Cwmeynon, Tyr Ralph, Blaenantywenallt, Tyr Evan Bach Draws, Aberdare.	Do.
1827—27 Jan.	Caer Llan and other properties, Llantrisant.	Do.
1834—16 Dec.	Moiety of Minerals under Tynwydd, Tonllwydd, Blaenselig and Llethrddu, Parish of Ystradyfodwg, Moiety of Minerals Penheol-Llechau and Cefn-Llechan, Parish of Llanwono.	Do.
1846—29 Nov.	Cwmsaerbren, Treherbert ...	Do.
1858—11 Dec.	Maesyfelin Llantrisant ...	Do.
1867—24 Ang.	Pwllypant Estate ...	Will of William Evans Williams.
1867—12 June	Twynygidien, Parish of Gelligaer.	Conveyance.
1872—7 June	Bedlinog Uchaf, Bedlinog Ishaf, Llwynrwn, Cwm-felin and Tyr-y-llan, Parish of Gelligaer.	Do.
1872—31 Dec.	Tir Maerdy, Parish of Gelligaer.	Do.
1875—2 April	Yagwyddgwyn Uchaf, Cilhaul and Glynymarch, Parish of Gelligaer.	Do.
1885—29 Oct.	Part Mwyndy, Llantrisant	Do.
1885—7 Oct...	Brithdir Ucbaf, Brithdir Ishaf and Tyladu, Parish of Gelligaer.	Do.
1886—30 April	Ffynonbwla, Parish of Eglwysilan.	Do.
1888—28 Sept.	Llan Tynwydd and Gedris, Parishes of Pentrych and Llantwit Fardre.	Do.
1889—12 Jan.	Moiety of Minerals under Mynydd Maio and Coedcae Gwillt, Parish of Eglwysilan.	Do.
1889—1 Feb.	Cefn, Llantwit Fardre ...	Do.
1891—12 Dec.	Graig Hill, Llantrisant ...	Do.
1896—22 May	Gwern-y-Mole Fachllantrisant.	Do.
1897—8 July	Ynyslyn, Parish of Eglwysilan.	Do.
1899—2 Jan.	Moiety of Minerals under Mynydd-Maio, Parish of Eglwysilan.	Do.
1899—11 Jan.	Penygroes, Parish of Eglwysilan.	Do.
1904—21 Dec.	Brynhae, Parish of Gelligaer.	Do.
1916—31 Dec.	Ynysallan, Llantrisant ...	Do.
1919 ...	Lanelay Fach, &c., Llantrisant.	Do.

The above have an area of about 7,000 acres and the purchase money paid represents over £240,000, £220,000 being paid in the last 100 years.

During the last 50 years mineral property to the extent of 2,317 acres has been purchased by the Estate at prices amounting to over £150,000.

All the above are situate in the County of Glamorgan, except 61 acres of the Pwllypant Estate, which is in the County of Monmouth.

The following are the properties in Scotland:—

Bute, Inchmarnock and Cumbrae, Southall, Dumfries Estate, Wigtonshire Estate, Sanquhar Estate.

With the exception of 6 small farms the whole of the above were purchased by witness or his predecessors in Title.

The 6 farms referred to contain no minerals. The only estate in Scotland belonging to witness which contains minerals is the Dumfries Estate."

15,754. *Mr. Frank Hodges*: I see that in paragraph (c) of your *précis* the average royalty, taking into consideration both fixed and sliding scale royalties, is 8-14d. per ton. Have you made any comparison between that average and the average of other mineral owners in the South Wales coalfield?—Yes, mine is a little higher.

15,755. Do you regard yourself as being the owner of the largest area of mineral property in South Wales?—I could not tell you.

15,756. Do you know of any who own more?—No, I do not know the extent of the holding of anyone else, I am afraid.

15,757. If I were to put it to you that you are drawing a higher amount of royalty per ton, on the average, than any other royalty owner, and that you draw in the aggregate a larger amount per annum, should I be stating a fair proposition? Would you deny that?—My royalty is higher. I do not know about the aggregate.

15,758. I think that is the fact?—Then take it by all means.

15,759. I see in your *précis* that the minerals which you now hold have come to you in various ways. Two portions you admit came to your family in the year 1547 and the year 1550?—Yes.

15,760. And both those properties comprise Miskin, Glynrhondda, Llantrisant, and Pentrych and Clun, Ruthin, Senghennydd Upper and Lower, and Rudry?—Yes.

15,761. Have you studied the history of the procedure by which the man referred to here, Sir William Herbert, received that property?—No, I have not done so.

15,762. Has anyone ever brought it to your notice casually?—The only thing I know about it is that one of the services for which he received these lands was the raising of an army. There were other services. I do not know what they are.

15,763. Are you quite sure of that?—So I have been told.

15,764. Suppose I quote the services which this knight is supposed to have rendered; it might help you to come to rather a different conclusion?—Perhaps so.

15,765. I am quoting from a copy of the actual document which granted him this property. "Know ye that we in consideration of the good true faithful and acceptable service which our beloved and trusty counsellor William Herbert Knight of the Order of the Garter Master of our Horse at his great charges to us hath lately done and performed against the Rebels in the west parts of this our Kingdom of England and for other causes and considerations." For quelling the rebels in the western parts of England these properties were conferred upon him. Did you know that before?—I have heard that, yes.

15,766. That is, a queller of revolutions?—Yes, or rebels. I do not know about revolutions.

15,767. I suppose you cannot quite dissociate rebels from rebellion?—I do not know who the rebels were.

15,768. So that was the kind of service. Apparently the theory that he raised an army does not quite square with that?—Yes, I believe it does. At all events he raised the army to quell the rebels.

15,769. The supposition is he raised the army to quell the rebels?—I suppose so.

9 May, 1919.]

THE MOST HON. JOHN, MARQUIS OF BUTE.

[Continued.]

15,770. Not for service in a foreign land?—I cannot possibly tell that; he might have done that, too. There might have been other services.

15,771. If that was the service rendered, who was the judge who recognised the value of that service?—I cannot tell you.

15,772. Was it the King?—I cannot tell you.

15,773. You do not know?—No.

15,774. The King signed this document?—Very well.

15,775. And he was between 10 years of age and 14 years of age when he signed it? You are aware that King Edward VI. did that when he was 15?—Yes.

15,776. So that in effect a minor, not a minor, in the sense of the law transferred to Sir William Herbert one of the greatest properties that has ever been known to be transferred to one man, except perhaps the Duke of Northumberland. Would that be a legal transaction, do you think?—Yes, I am advised it was a legal transaction.

15,777. Although he was only between 10 and 14 years of age, he had authority to grant that property to your ancestor?—Yes.

15,778. Your ancestor was one of the executors of the will of King Henry VIII., was he not?—I do not know.

15,779. Do not you think it would be rather an elementary duty of a man who holds such large takings as described in your *précis* to acquaint himself with the documents which entitle him to possess them?—I am afraid there are too many documents to go over. I should not have time.

15,780. I know life is rather a hurry, but fortunately someone found this document and preserved it. You are aware, are you not, it was regarded as having been lost for a couple of centuries?—No, I was not aware of that.

15,781. Are you aware it was discovered in the Record Office by a man named Hobson Matthews, who was in the employ of the Cardiff Corporation?—No.

15,782. You are not aware of that?—No.

15,783. Are you aware the Cardiff Corporation still possess this deed?—So I believe.

15,784. And in effect the conclusion is generally held in South Wales, by those best able to judge, that the executor of the will of King Henry VIII. appropriated for himself, under the signature of the King, who was then 10 years of age, all the Lordships of Miskin, Glynrhondda, Llantrisant, Pentyrech and Clun and about 30 more in addition in Monmouthshire and Breconshire. Are you aware of that?—No. I am not aware of that.

15,785. You live in Cardiff, I think, sometimes?—Yes.

15,786. Are you aware there is a paper published in Cardiff called "The South Wales Daily News"?—Yes.

15,787. That is rather contemporary, I forgot. This paper, commenting upon this article on June 1st, 1912, made this statement. I want to ask you if you might be likely to agree with it. "It will be seen that Sir William Herbert, one of the guardians of the boy King Edward VI., granted to himself enormous areas of land which at that time were in the possession of the Crown, using the boy King's name in order to enrich himself. The portion of the document which we publish refers only to the South Wales territory which Sir William Herbert secured in this manner. But he was equally rapacious in regard to properties in a number of counties in England—Middlesex, Essex, Wilts, Stafford, Gloucester, Somerset and Devon. For 360 years the industrial classes over a vast territory in South Wales have paid enormous revenues into the pockets of those who have inherited that property. Literally, millions of money in agricultural rents, mineral royalties, ground rents, &c., have been paid and received as the outcome of this gigantic fraud." I believe you know the "South Wales Daily News" pretty well?—Yes.

15,788. A very respectable paper?—I would rather not pass an opinion.

15,789. Did it not occur to you that such a statement that this property was held by fraud was a statement that should have been indictable?—I cannot indict all things that are put into newspapers about it.

15,790. If it is based on documentary evidence, I suppose that would rather deter you from proceedings, would it not?

Mr. R. W. Cooper: The person to indict would be Sir William Herbert.

Mr. Frank Hodges: I think there is some prestige in a family name people like to protect.

15,791. That being the case, if the nation at this stage, in the year 1919 or 1920, as the case might be—?—I do not know I agree that is the case.

15,792. It must be the case, because it corresponds with your own description of the manors of Miskin, Glynrhondda and Llantrisant, which are only part of the manors referred to in this document?—Yes.

15,793. As a matter of fact, your ancestor, Sir William Herbert, owned the whole of Cardiff. The taking of the property extends from Chepstow to Swansea, including all that valuable mineral property of the Rhonddas and Glyn Neath right down to Neath. The "South Wales Daily News" was very helpful. They produced a map—perhaps you might care to see it later—showing the extent of the land which he thus acquired. I am coming to this point. If that be the case, and this Commission decided that it was for the benefit of posterity that the minerals in that property, being of great national value, should be acquired back for the nation in the interests of the future, would you suggest that the nation now should compensate you, in this generation, out of public funds for the retaking of those minerals for national use?—Yes, I should.

15,794. You would?—Yes.

15,795. Even if that compensation burdened, to some extent, the poor taxpayers of this country?—I am burdened to some extent as a poor taxpayer.

15,796. As a matter of fact you are entitled, after paying the whole of your taxes out of that amount, to over £25,000?—That is so.

15,797. Do you sincerely suggest that after having held the property for 360 years on the signature of a boy King of 10 years of age, that when the nation wants it back the nation, out of its accumulated funds, or by taxes, should for this compensate you and your successive generations?—Well, the nation has recognised my right to it.

15,798. Exactly. Should it be continued indefinitely in that way?—I think it should.

15,799. Do you think for all time your children, your heirs and successors should enjoy what your ancestors have enjoyed for the last 360 years?—I think the right should remain recognised.

15,800. Do not you think if that were so, either you or one of your successors may in turn have to raise another army to quell another lot of rebels?—I do not think so. I see no reason for it.

Mr. Frank Hodges: It was because there were such indications that this Commission had to begin its sitting, you know.

Mr. Arthur Balfour: I do not know if you know that Mr. Smillie has quoted to us several times from Williams on Real Property as to the title of property?—Yes.

15,801. It is not Mr. Williams our colleague on the Commission? On page 593 he says: "So that the possession of land for a prescribed period"—that is the twelve years which have been mentioned—"will give a good title thereto as against all the world." Do you agree with that?—I understand that is correct.

15,802. Mr. R. W. Cooper: You have been asked questions about the history of King Edward VI. I suppose, like myself, you have not had an opportunity of refreshing your memory with regard to the history of that particular monarch?—No, I have not done so.

15,803. I suppose as a general student of history you know when a monarch is under age there is generally a Regent or a Council of Regency?—Yes.

9 May, 1919.]

THE MOST HON. JOHN, MARQUIS OF BUTE.

[Continued.]

15,804. And the powers of the Crown are exercised on the advice or through that Regent or Council of Regency?—Yes, quite.

15,805. *Mr. Robert Smillie*: I think you must be very thankful there are such things as clever lawyers in this country to protect you from time to time against the people?—I do not know. One suffers the other way sometimes.

15,806. I think the financial gain would be yours in the end of having the services of clever lawyers?—I do not understand. The financial gain?

15,807. Yes.—You mean the lawyers will not absolutely ruin me?

15,808. I think there was a little over £4,000,000 left at the death of your predecessor?—I do not know the exact sum. It may have been.

15,809. It was given as over £4,000,000?—I think so.

15,810. I think it may be taken that that is a larger share than the vast majority of people of this country possess?—Yes, I believe it is.

15,811. I think your family are of Scottish origin?—Yes.

15,812. They have not confined their attention entirely to Scotland?—No, not entirely.

15,813. Unfortunately for the Welsh people. You have some mines in Dumfries?—Yes, in Ayrshire.

15,814. Is that Sanquhar?—Only one farm, 80 acres.

15,815. You have nothing to do with the coal there on the borders?—No, nothing to do with it, unless there is coal under the 80 acres, but I should think it is all worked out.

15,816. That is on the border line of Ayrshire and Dumfries?—It is in Dumfriesshire, I think, really.

15,817. There is no coal coming out there?—No, I do not think so.

15,818. Have you had anything to do with the lead mining industry?—No.

15,819. I think it is sometimes very convenient for gentlemen in your position to be fairly well represented on public authorities, such as the Cardiff Town Council?—I do not know about that—what did you say?

15,820. I was saying that with regard to gentlemen in possession of immense interests roundabout a city, such as docks, railways, mines, and so on, or minerals, it is in your interest that you should be fairly well represented on the Town Council or County Council, so that when questions affecting you come up your position may be 'out'?—It certainly would make discussions easier, I think.

15,821. I think, generally speaking, your Factor whenever an opportunity presents itself gets elected to every County Council?—Yes, it is generally done. If one is a big ratepayer one is represented in that way. I am on the County Council myself.

15,822. In your case do you expect that your interests, generally speaking, should be put before the interests of the community on all occasions?—No, not before it necessarily.

15,823. Are you in possession of the whole of the Isle of Bute?—No, all except the town property.

15,824. Do you know historically whether at one time a very large number of people owned land in the Isle of Bute?—Yes.

15,825. Do you know whether the Marquis for the time being watched very carefully for the death of one of these freeholders and that on his death he sent his agents to collect the titles so that he might sign them?—No, I do not.

15,826. And those titles never were returned and those people had to pay as tenant farmers after that?—No, there are none of them left. None of the persons are left. My ancestor bought up direct what used to be called the Barons of Bute.

15,827. It is alleged—I have no documentary evidence at the moment to prove the method of buying—it was to secure the title deeds and making people believe they were going to be re-signed and transferred; but they were never returned and immediately those people had to pay rent. If that is so, and I could prove it was so, you would not justify for a moment an action of that kind?—It does not seem a very fair proposition.

15,828. It would not seem fair with a person who had the title that the Marquis of Bute should collect that title on his death and keep hold of it and then charge him rent. That would not be fair?—No.

15,829. If that has been done by your predecessors, and we could prove it was done, would you recommend those people who had been wrongfully robbed?—It is not proved; it is a matter for law.

15,830. If we can bring proof?—If you can bring proof—that is entirely necessary.

Sir Arthur Duckham: Is there any possibility of this proof coming forward? It is rather interesting, and, if there is a possibility of getting it, it should be put in.

Mr. R. W. Cooper: I understood Lord Bute to say there are no mines in the Isle of Bute.

Sir Arthur Duckham: I think the onus should be upon Mr. Smillie.

Chairman: We are getting a little wide. Mr. Smillie will not be much longer now.

Mr. Robert Smillie: His Lordship professes his predecessor, the Marquis of Bute, bought them out. If he bought them out and paid them, there will be receipts to prove that. The proof should be on him to show it. At the present time, they are paying rent.

Mr. R. W. Cooper: I must respectfully protest.

15,831. *Mr. Evan Williams*: When your father died in 1900 you had to pay death duties on all the minerals under your estate?—Yes.

15,832. Both developed and undeveloped?—Yes, undeveloped also.

15,833. At that time the State acknowledged your title to the minerals?—Yes. I paid for them, anyway.

15,834. How many mineral lessees have you, altogether, in South Wales?—In Wales I have about 25.

15,835. Twenty-five lessees?—Yes.

15,836. How many leases?—About double the number.

15,837. Have you any disputes with any of those lessees at the present time?—No, no disputes now.

15,838. With regard to the working of the minerals?—I have not had for a long time.

15,839. Have you had any requests from any of your lessees for concessions of any kind?—Occasionally, there have been concessions.

15,840. You have been requested to make concessions?—Yes, in hard times concessions have been made.

15,841. You have made them?—Yes, in one or two cases very heavy concessions were made.

15,842. Can you give us some idea of the extent of them?

Chairman: Mr. Harris might assist your lordship?—Since 1859 nearly £150,000 has been given away in concessions.

15,843. *Mr. Evan Williams*: You have remitted £150,000 of the amount due to you under the leases?—Yes.

15,844. Your ancestor really created the Bute Docks, did he not?—Yes, he started them. He started to build the Bute Docks in 1830, I think it was.

15,845. And spent a very large amount of money altogether?—Yes, he spent all the money he had anyway.

15,846. The existence of those docks has contributed very largely to the development of the South Wales coalfield?—That was the pioneer work, I think one may say, of the coal industry.

15,847. Do you know what the total amount of money spent upon the Bute Docks was?—The total capital was about 5½ millions, I should think.

15,848. What revenue do you get?—I get only 1½ per cent. from that.

15,849. The income you get from that expenditure is 1½ per cent?—Yes.

15,850. On the capital?—Yes.

15,851. Have you yourself, or your predecessors in possession of the estate, done anything in the way of development of mines?—Yes, my grandfather started the first sinking. He was the first to sink

9 May, 1919.]

THE MOST HON. JOHN, MARQUIS OF BUTE.

[Continued.]

down to the steam coal area. That was the Bute Merthyr Colliery at Treherbert.

15,852. When was that?—1850.

15,853. He was one of the pioneers?—I think he was the first to get down to the steam coal area.

15,854. Since that time has the development been continued by the Marquis of Bute?—Yes. I still work one mine. It was worked by a lessee who had a 99 years' lease, and he had got into trouble and could not continue, and my father took on the work then, and since then we have pulled it through.

15,855. It was in difficulties before your father took it over?—Yes, it was.

15,856. Because it was in difficulties he took it over?—Yes. They were £20,000 or £30,000 in debt and could not run it, and it had to be run for some years at a loss.

15,857. By the previous owner?—By my father.

15,858. After taking it over?—Yes.

15,859. On the whole, there has been a good deal of minerals worked by the Bute Estate itself?—Yes, the same thing happened in the case of the Abernant Collieries.

15,860. You have not been simply an owner of minerals but a worker of minerals as well?—We have always worked a certain amount ourselves.

15,861. *Sir Adam Nimmo*: Following up the questions asked by Mr. Evan Williams, I suppose your mineral properties have been very largely developed?—Yes, they are practically all let.

15,862. Practically all your coal is let?—Yes.

15,863. The whole development has taken place as the result of private enterprise?—Yes, undoubtedly.

15,864. I suppose, particularly in the South Wales coalfield, very heavy risks have been taken by these individuals?—Yes, very heavy risks; it has been very difficult.

15,865. Your view, I suppose, will be that private initiative and enterprise have been quite equal to the full development of your mineral property?—Yes, as far as my property is concerned that is certainly the case.

15,866. May I take it that if private enterprise is left to itself it will continue to be equal to the fullest possible development of minerals in the national interest?—Yes, I certainly think so.

15,867. Would it be your personal view, having regard to the developments that have taken place, that this principle of individual initiative and enterprise should be continued?—It seems the most satisfactory one I can think of.

15,868. We have had it stated very frequently in evidence that there are cases where coal may be held up contrary to the national interest or where coal has been lost contrary to the national interest. Would your view be that that should be prevented as far as possible?—Certainly; I always do prevent it as far as possible. As far as I am concerned, my object is to develop.

15,869. Your whole object is to develop your minerals to the fullest extent possible?—Yes, it always has been.

15,870. Assuming there were such problems as I have indicated, as far as you are concerned as a proprietor, you would be prepared to accept any restrictions that might be required to be put upon you to solve this problem?—Certainly; if there were difficulties in the way.

15,871. And set free the coal to the fullest extent possible in the national interest?—Yes.

15,872. *Sir L. Chiozza Money*: With regard to the questions asked you by Sir Adam Nimmo, do you think in view of the very great importance of coal to the economy of the country, that the mineral resources of the country ought to be under the control of private individuals?—I think it has worked very well so far. I am bound to say the trade has developed very fast.

15,873. Do you know it is the opinion of some people, at least, who have studied the economical history of this country that we are 25 years at least behind the point where we ought to have reached in economic development because of the private ownership of minerals?—I do not think it is so. You say

it is because of the private ownership. Are those publicly-owned far ahead?

15,874. You are aware, are you not, the answer to that is the inventions of the steam engine and railways were British inventions, and those inventions gave, as they probably ought to have done, the leadership to this country. In spite of that leadership is it not a fact that the private ownership of minerals did retard the progress of this country for a great many years?—I am afraid I do not agree.

15,875. You are aware that through the private owning and working of minerals during a period of three quarters of a century which ended only in 1845, coal was sold abroad at a cheaper rate than it was at home?—I am not aware of that.

15,876. Do not you think it is a reasonable conclusion from that, if that took place down to nearly the middle of the 19th Century, that did retard the progress of this country enormously?—No.

15,877. To come to the present day—I make no personal charge in this matter, it would be wrong for me to do so because I do not know your particular method of working—are you aware that in a considerable number of cases, even still, there are very grave disabilities relating to the working of coal which relate to the private ownership of coal?—I am not aware of that.

15,878. Do you know they were commented upon by the last Royal Commission on coal?—No. I am not an expert. I am not an engineer.

15,879. I put it to you that you being the owner of a coal area which is probably richer than the coal area of many of our colonies, is it not rather an unfortunate thing that the government of that coal should be in the hands of a private individual, who may be enterprising, or, again, might not be enterprising?—No, I do not think so—why?

15,880. Assuming you are as enterprising as you ought to be; is it not conceivable you might have a successor who would not be enterprising and would be unreasonably. Is it not conceivable?—It is conceivable, perhaps.

15,881. Does it not really happen? Do you know, during the war coal has been held up, on the evidence of Sir Richard Redmayne. He gave a number of extraordinary cases in which not only caprice was shown in the holding up of coal, but what one may call childish caprice?—I have not held it up.

15,882. Are you aware a Governmental Committee has reported there are 14 categories of disabilities with regard to private ownership?—Is that so? There are snags in most things.

15,883. Does not that suggest private ownership cannot be a good thing for the country?—No, it might happen in other cases.

15,884. Can you tell me whether you have to have a sort of official body of men to help you in this matter of coal ownership?—Yes.

15,885. Can you tell me how many there are—you have a sort of Minister of Mines, have you not?—No. I have a mining engineer.

15,886. That is what I mean. Can you tell me what sort of a staff he has?—I cannot tell you the whole of his staff; it is according to his work. He has three or four I know.

15,887. You do not know how many it is?—It takes to manage the whole of this property?

15,888. Yes?—I might make a shot at it. I had better not; I might be wrong.

15,889. If I have to make up mind whether it is good for the minerals to remain in private ownership or come under public ownership, does the private owner, assuming he is an enterprising individual, have such a staff under him as to enable him to enforce the conditions of leases and to see that houses are put up if there are conditions relating to houses? Can you tell me what sort of a staff you have to help you to do that. It is a government, is it not?—Simply with the mines?

15,890. Yes. With all your mining leases what sort of government have you because it is a government. I am anxious to know. I wanted to ascertain from the other witnesses. Perhaps you can help me?—I have a lawyer to start with; a mining engineer, and they have their staffs.

9 May, 1919.]

THE MOST HON. JOHN, MARQUIS OF BUTE.

[Continued.]

15,891. Are there many different kinds of covenants under these leases with regard to the getting out of coal with regard to shorts, houses, and that sort of thing?—There must be. I am not an expert. There must be a lot of covenants.

15,892. It presents itself in this way to me. You govern part of this country with your riches in coal—more than New Zealand probably?—Is there much coal in New Zealand?

15,893. No, that is what I say. Curiously they consider it a very considerable quantity and you

have more, therefore you really do exercise government control, do you not? I want you to help me to see how you govern the coal; how the mining covenants do their duty. You cannot help me in that?—No, except everything works very smoothly. I have no complaints.

15,894. If you are the government and do not know, is not that a proof the government might not be all it ought to be?—Not at all. I have a mines manager.

(The Witness withdrew.)

Mr. JOHN DAVID McLAUCHLAN, Sworn and Examined.

Chairman: Mr. John David McLauchlan is a mining engineer and a Member of the Institution of Civil Engineers. He is a partner in the firm of Messrs. John & G. H. Geddes, mining engineers, who have been established for more than one hundred years in Edinburgh. His firm advise many Scottish mineral owners and have a large experience in the adjustment of mineral leases in Scotland. (To the Witness:) You speak as to Scotland. Your proof is a lengthy one—I do not say it is too long; but will you kindly read it yourself.

Witness: “In letting Scottish mineral fields, the practice is for the owner to receive offers from parties desirous of working his minerals, and to let to the party with whom he can make the best terms, this not necessarily being the one offering the highest rate of royalty. I do not think it would be unfair to owners if they were compelled to let their minerals, and grant underground and service wayleaves on reasonable terms, and in this connection I am in sympathy with Sir Richard Redmayne, when he suggests in his evidence that there should be more “collective production.” This, I think, should apply not only to the coal and other minerals worked, doing away with the inconvenience of irregular boundaries, barriers, &c., but should also apply to the pumping of water in selected districts. Faults in the strata, when dykes, &c., are often much more satisfactory boundaries of a coal area to be worked by one or more pairs of pits than the actual boundaries of the lands belonging to the various owners, and the straighter the boundary is the better. Under this system each owner would get royalty on his own minerals, whether they were worked by pits on his own lands or not, and the cost of pumping the water would be borne by the different workers of the minerals in proportion to the output from the district, or under some other fair arrangement. If and when the very rare occasion occurs of areas being held up, or exorbitant royalties or wayleaves asked, compulsory powers might be conferred on lessees to work these small areas, on royalty terms to be fixed by arbitration, including the wayleaves to be paid. The duration of leases in Scotland seldom exceeds 3½ years, and the lessee can always break his lease at fixed periods, on giving the notice stipulated for in his lease. Breaks are allowed at from, say, every fifth year down to half-yearly, and occasionally arrangements are made allowing a lease to be given up at any time on a month or two’s notice being given. The owner has no right to break the lease as a rule. In the case of an unworked mineral field, or one which has been unworked for a time, and is about to be resumed, there is always a period at the beginning of the lease allowed free of certain rent for the purpose of proving and fitting the field, royalty being paid at the agreed on rate on any minerals put out during the period. A very common rate of Certain, or Annual rent is £1 per acre, but there are cases where this is higher, and also where it is lower, this depending on the conditions. The rate of royalty in Scotland is usually a rate per ton, and is generally paid on the quantity of coal disposed of. It is either a fixed rate, a proportion of the price obtained for the mineral at the pit mouth, or a minimum rate is payable, with an addition of a proportion of the selling price obtained over a fixed sum in any year or half-year. In a very few cases the royalty per ton depends on the selling

price of round or screened coal at a shipping port. Power is always given to make up “shorts.” In my experience, owners are as a general rule willing to consider representations made to them as to the conditions of leases, and to modify these when necessary. The following instances within my knowledge occur to me:—

Lochgelly Iron and Coal Co.

- (a) The Earl of Minto has arranged to accept a fixed rent of 6d. per ton instead of a sliding scale rent with a minimum of 5d.
- (b) Sir R. M. Ferguson in 1914 agreed to accept a fixed 4½d. per ton in lieu of a sliding scale with a minimum of 4d.

Concessions of a similar nature have to my own knowledge been made to Wm. Baird & Co. (Col. Pollock-Morris), Shott’s Iron Co. (Col. Trotter), the Portland Colliery Co. (Lord Howard de Walden), and Mr. Barnes Graham’s Trustees reduced his royalty, payable in respect of his Gilbertfield (Lanarkshire) Estate, quite recently from 7½d. to 5d. per ton. As to proving minerals and pumping, mineral owners in Scotland sometimes put down bores to prove their properties with the view of having the minerals in them developed. In 1894-5 Sir Ronald Munro Ferguson of Raith put down bores on the lands of Dogton, near Kirkcaldy, spending at least £1,200. A deep bore was put down to north-east of Thornton Junction, in Fife, by Mr. Balfour of Balgonie and the Wemyss Colliery Trust, both royalty owners. This bore was put down to a depth of 755 fathoms, 4 feet 7 inches, and cost between £7,000 and £8,000. In 1909 the Duke of Portland put a bore down in the bottom of a pit on his property between Hurlford and Galston, in Ayrshire, to prove the lower seams there. This bore was 150 fathoms deep. Shortly before that Lord Howard de Walden paid for the continuing of a bore put down near Kilmarnock to a depth of 50 fathoms beyond 100 fathoms in order to prove ironstone, and possibly coal. In 1911 Lord Howard de Walden entered into a lease with Messrs. James Dunlop & Co. of the minerals in a large area—2,000 acres in extent—lying to north of Mauchline, in Ayrshire, and undertook to bear half the cost of boring the field up to £1,500. After a certain amount of boring had been done, the tenants intimated that they did not consider the prospects sufficiently good, and threw up the lease. Lord Howard de Walden paid them £1,000 towards the cost of boring, and spent another £500, which brought the sum spent up to the limit to which he had agreed. Although the tenants who took the lease did not go on, proposals are now being made to lease and develop this coalfield. The Duke of Portland has on more than one occasion assisted his mineral tenants in the Irvine Valley, near Kilmarnock, by paying part of the cost of pumping plant. The last occasion was about three years ago, when, on account of a neighbouring colliery being stopped, the tenants, the Gauchalland Coal Co., were apprehensive that they would have to pump additional water. A new electrical pump was established, to the cost of which the Duke of Portland and a neighbour contributed. The Duke, at the same time, reduced his lordship to the extent of one halfpenny per ton on the coal raised from his lands by the Gauchalland Coal Co., to assist in the annual cost of pumping the water. There will no doubt be other cases

9 May, 1919.]

MR. JOHN DAVID McLAUCHLAN.

[Continued.]

where similar action has been taken by royalty owners, but the above are cases with which I am personally familiar. No difficulty usually arises in Scotland as to assigning a coal lease, but sub-lotting is uncommon, except as a virtual exchange of small areas between two adjoining lessees who can more conveniently and economically work the exchanged lots. I think all leases within my own knowledge contain fair arbitration clauses. I do not think that in Scotland cases are numerous where the proprietor of minerals does not own the surface, and as a rule a reasonable arrangement for working the coal is come to. In the working of coal, the ownership of which is separated from the ownership of the surface, difficulties do not usually arise with regard to the use of the surface for mining purposes, as such use is governed by the terms of the grant of the surface. In those cases in which the rights reserved to the use of the surface or arising at common law are insufficient according to modern ideas to secure the proper working of the coal, power should, I think, be given to a lessee to obtain by arbitration or otherwise further rights of use as to site and rent. The average royalty on coal in Scotland for the first three-quarters of 1918 was brought out by Mr. Dickinson at 8.75d. on the output ton, and 9.86d. per ton on disposals. The minimum fixed overhead royalty may be taken at 3d. per ton, and the maximum at 8d., with a somewhat higher figure in particular places for particular seams of coal, and Mr. Dickinson's figures no doubt take into account the sliding scale in force at a number of collieries."

15,895. *Chairman*: When you say a number of collieries, are there many which have the sliding scale?—Yes, a good many.

15,896. Is it more than half?—Not more than half, I should think.

15,897. Are sliding scales, do you think, more prevalent in Scotland than they are in England?—I do not know, but I think perhaps they are. I cannot tell you. "To make up for the deficit of £13,000,000 referred to in the Commissioners' report, regular work on the part of the miners is, of course the first thing necessary, and if improvements can be introduced in the way of conveying them to and from the coal face and in the methods of coal-getting they should be undertaken."

15,898. By whom?—By the owners. "The conditions in Scotland are not, generally speaking, so favourable as those in England, and owing to the presence of many faults, whin dykes, &c., it will not be easy to carry out improvements at many of the collieries.

If nationalisation is decided on, I am of opinion that each colliery would have to be valued separately, as the conditions of life of each vary so much. Exactly the same applies to individual royalties. Both of these I have been accustomed to value for the past five and twenty years, and have never got into serious dispute on the subject of valuation."

15,899. What do you say are the items which ought to be taken into consideration in valuing the colliery?—First of all, its life.

15,900. What next? You say "first of all"?—Its life, first of all—the number of years that it will last at a certain rate of output.

15,901. Is that all?—No.

15,902. I want to know what they should be. Should I be right in saying the first thing is the certainty of an appreciable quantity of coal?—Yes.

15,903. That is the life?—No, the life is the time the colliery will last at the rate of output per annum.

15,904. What is the next thing?—The probable profit per annum.

15,905. It is a profit comprised of two items?—I do not think so.

15,906. You would have to get, first of all, the cost of raising and dispatching the coal?—Yes.

15,907. Then the value of the coal?—Yes.

15,908. What is the next thing?—Then you have to arrange for a sinking fund to get back your capital, because coal is an exhaustible subject.

15,909. Taking into consideration the probable yearly output?—Yes. Then you have to allow for interest to the purchaser, and from that you can arrive at the number of years' purchase that the thing is worth.

15,910. Do you ever take into consideration fixed assets, machinery and so on?—Yes.

15,911. You have not mentioned these things?—The machinery is taken in this way. You take the present value of its break up value at the end of the lease. Against that you must put what it will cost the colliery owner to restore all the surface.

15,912. Those methods are perfectly well understood?—I think they are—and are in practice.

15,913. An expert surveyor would have no difficulty in applying them?—None whatever.

"With regard to the alleged waste of small coal, this does not seriously apply to Scotland, where for a long time now the general practice has been to fill the coal with a close shovel. I think the nationalisation of mines and minerals of the country would be a step in the wrong direction. It would do away with all incentive to enterpriso on the part of individuals or trading concerns. I take it the duties of a possible Minister of Mines will be to look after the interests of the public and provide coal as cheaply as possible for all purposes, providing at the same time a reasonable wage to the miners. This may involve concentration of effort on the collieries which are most suitable for this purpose, and would probably mean the closing of many of the smaller collieries. I doubt if the miners realise what it will mean to them, at any rate in regard to a restriction of the choico they have had in deciding where they will work. I see no objection, however, to, and would in fact recommend, that mineral owners should be controlled to a certain extent by the State in order that our mineral resources may be made the most of and developments be properly designed and carried out."

15,914. What do you mean by "a certain extent"? That is rather a vague phrase. We want something definite?—I mean short of taking them over altogether really.

15,915. That is rather indefinite—"short of taking them over altogether"—what does it mean?—I have already said, for example, that areas might be set aside to be worked, and that a tribunal appointed by Government might say a certain area is to be worked by one or more pairs of pits and collective production applied to that area.

15,916. Who is to start the pits?—The pits I am talking of are all down now; some re-arrangement is necessary. I am not talking here of new pits. I am talking of the pits that are there already.

15,917. I do not follow you when you say, "I see no objection, however, to, and would in fact recommend that mineral owners should be controlled to a certain extent by the State." Will you give us a rather more definite idea of your views?—They should not be allowed still to say that their property should only be worked by a certain pair of pits, and to say that their neighbours' property should not come out through their pits, and insist on barriers.

15,918. Have you any sort of scheme with regard to that?—I have no scheme as yet.

15,919. That is just the sort of thing that personally I am so anxious to hear you give evidence on. When you use the words "to a certain extent" it leaves me a little doubtful as to what your real meaning is?—Of course one could prepare a scheme with regard to the districts that one knows, but it would take some little time. I cannot give it to you right off, I am afraid.

15,920. At any rate, you have not done it up to now?—I have not done it up to now: "I consider that competition amongst collieries is necessary for the public good, and that nationalisation will not tend to efficiency or increase of output."

15,921. Do you consider that competition amongst collieries for the export trade is for the public good?—Perhaps not for the export trade.

9 May, 1919.]

MR. JOHN DAVID McLAUCHLAN.

[Continued.]

15,922. What do you propose to do there—eliminate competition?—No, I have not suggested that.

15,923. I know you have not. What do you propose to do? You say for the export trade competition is not good; therefore I am asking you what you consider is the best thing to do. Perhaps you have not considered it?—I have not considered it.

"I understand the German Socialisation Committee were agreed on one point, that the worst solution of the problem was State management, which is cumbersome and bureaucratic, and fails to appoint efficient persons as managers. I also understand that the Saarbrücken Coalfield in Germany, which is a State-worked coalfield, has cost the Prussian Treasury vast sums of money, operations having been carried on at a heavy loss, whilst the privately worked Westphalian Coalfields made huge profits, and yet conditions of employment were better in the latter coalfield, and the price of coal to the general public was actually lower. As to unlet areas, most of these have been valued as at 30th April, 1909, for the purpose of the Finance Act, and they can be valued again at any time. Their value is, of course, a deferred one. The values put on unlet and improved mineral areas as at 30th April, 1909, are based in many cases on assumption as to the presence of workable minerals in them. Before these areas are taken over by the State bores should be put down by Government to prove what minerals are really in them. If the minerals of this country are to be expropriated the rights of the owner in the surface overlying them ought to be considered, and fair compensation for lowering the surface and for damage by subsidence must be allowed."

15,924. You have been good enough to tell us quite clearly what your view was as to the matters to take into consideration in paying for a coal mine. Now, would you tell us what the compensation in your view ought to be in respect of minerals? What do you take into consideration?—I do not quite understand the question.

15,925. You were good enough to tell us just now very clearly indeed, which was of great assistance to us, the elements that ought to be taken into consideration in valuing a coal mine. Now I want you to tell us the elements that ought to be taken into consideration in valuing minerals for compensation as distinguished from a mine. What you say is: "If the minerals of this country are to be expropriated, the rights of the owner in the surface overlying them ought to be considered, and fair compensation for lowering the surface and for damage by subsidence must be allowed"—That is the surface I am referring to.

15,926. The surface only?—Yes, not the minerals.

15,927. With regard to the minerals, what do you take into consideration?—Very much the same as in the case of a colliery owner, except that you take the royalty instead of the profits, and you have to deduct Mineral Rights Duty and your local rates and taxes in Scotland before you arrive at the net annual revenue.

15,928. Is there any difference with regard to potential properties?—In the case of potential properties it is a much deferred value.

15,929. What would you do in the case of property where the existence of coal is uncertain?—I think the Government might bore it.

15,930. As regards compensation, do you say that there ought to be bore holes put down everywhere before you assess the compensation?—In the unproved fields, you mean?

15,931. Yes?—Yes, I think so.

15,932. If there was an unproved field, before you assess the value of it you say it ought to be bored?—Yes.

15,933. At whose expense?—First of all at the Government's expense. If the coal turned out to be valuable, it might be taken off the sum to be paid for compensation.

15,934. Suppose it was said, "You are going to take over my land; you must bore it to ascertain the

amount of it"—and the gentleman has to bore it, and it turns out there is no coal—do you say that he ought to pay for the boring?—No, I think in that case the Government should pay for it.

"A large sum will be required to pay for the mineral royalties, and to produce interest on this it will probably be necessary to charge the collieries with royalty on the coal. That being so, I do not think there is any advantage in taking over the minerals so long as proper control as to their working development is assured. Each individual owner has an interest in seeing that the output from his own property is maintained, and increased when possible, and any shortcoming is brought under the notice of his mineral tenant. Under State management this interest in each property would probably disappear, and the consequence might be decrease of output. If royalties are nationalised there will be a loss of taxation, Mineral Rights Duty, Excess Mineral Rights Duty, Increment Value Duty, &c., and in Scotland a loss to local authorities, as local rates are paid in income from minerals."

15,935. I am obliged to you for your very interesting proof. Is there anything you want to add to it?—Yes, I have a short statement here I should like to read: "I do not think that the question of what exactly it is proposed to nationalise has so far been made clear to the Commission. In dealing with the question of nationalising the minerals of the country, the witnesses, so far as I can gather, have had in view only coal. In Scotland seams of Blackband and Clayband ironstone are still worked, some of them along with thin seams of coal. Is it proposed to nationalise both and sell the ironstone either calcined or in the raw state to ironmasters? In the Irvine Valley in Ayrshire on both sides of Kilmarnock there are a number of brickworks at which a flourishing industry is carried on. Some thin seams of coal are worked along with seams of valuable fireclay, which supply the brickworks with raw material. These thin seams would probably not be worked at all if it was not for the fireclay occurring along with them. In this case again, is it proposed to nationalise both and sell the fireclay to the brick-makers? Are the oil shale mines to be nationalised, and the shale sold to the oil producers? The difference between coal and those other minerals is that there is a public market for it practically in the condition in which it is mined, while ironstone, fireclay and shale must be manufactured in some way to put them in a state suitable for a public market. Are the iron works, brick works and oil works in Scotland to be nationalised?"

15,936. I quite see what you say about nationalisation. You have put it very clearly indeed. But assuming that nationalisation was recommended—only assuming—what would you make it apply to? Would you make it apply to all mines to which the Coal Mines Act applies?—Of course, to some mines the Coal Mines Act does not apply; for instance, lead mines.

15,937. You did not catch what I said. I was asking you, supposing nationalisation were recommended—only supposing it, because we have not heard all the evidence yet—would you advise that it should be applied to all mines to which the Coal Mines Act applies? I will read it to you, because you may not remember it, and it is an answer to your question, which is a very pertinent one: "Application of the Coal Mines Act, 1911.—The mines to which this Act applies are mines of coal, mines of stratified ironstone, and mines of fire-clay, and in this Act the expression 'Mines,' unless the context otherwise requires, means a mine to which this Act applies." Would you apply it to all those?—I think it would be difficult; for example, take the case of fire-clay; you have seams of fire-clay in Scotland five and six feet thick worked for the manufacture of silica brick. There is no market for that fire-clay in the raw state.

15,938. Would you tell me whether the coal is wrought in those mines as well as fire-clay?—No! Only fire-clay from those mines. That is at Glenboig, and in the Falkirk district, where there are numerous

9 May, 1919.]

MR. JOHN DAVID McLAUCHLAN.

[Continued.]

mines that mine fire-clay only, and that fire-clay is used to make silica bricks.

15,939. *Sir Adam Nimmo*: Are there not mines that have both coal and fire-clay?—I have just said so.

15,940. *Chairman*: You tell me that there are some mines where there is no coal obtained from them at all?—That is so.

15,941. Quito separate?—Quite separate.

15,942. Are there many?—Yes, a good many.

15,943. In what districts?—Very famous bricks are made from the fire-clay at Glenboig.

15,944. Are the mines out of the shafts of which comes not only fire-clay, but coal as well in a different position?—They are. You have those in Kilmarnock. In one case they work a 3 ft. seam of fire-clay with 16 inches of coal, and it is worked on the pillar and stall system.

15,945. Is it possible for practical purposes to separate a mine from which only fire-clay is produced from a mine from which coal and fire-clay is produced?—It would be difficult.

15,946. I am only asking you these questions by request, because you have not anybody on the Commission representing you. Supposing that nationalisation was recommended, would you advise the exclusion of mines from which coal itself is not produced?—I rather think I would.

15,947. And leave the fire-clay mines to themselves?—I think so.

15,948. That is your view?—Yes.

15,949. Although they might be cheek by jowl, so to speak?—Yes, although they might be. They are cheek by jowl with some of the coal mines, but in a different position geologically. The Millstone Grit Series of rocks come between our two coal series in Scotland, and this fire-clay is in the millstone grit position.

15,950. *Sir Adam Nimmo*: I know that you have a very large experience of the Scottish coalfield?—Yes.

15,951. I see that in your *précis* you begin by saying that you do not think it would be unfair to the owners if they were compelled to let their minerals?—Quite so.

15,952. Is it your view that no minerals should be allowed to be held up contrary to the national interest?—It is.

15,953. And that if any single proprietor were taking that course, there should be intervention in some form in the interests of the nation?—Yes.

15,954. May I take it that what you have in view is some right of appeal to some tribunal?—Yes.

15,955. In your view, would that be an adequate method of dealing with circumstances in which a lease was not granted?—I think so.

15,956. The application of the lessee would be made to such a tribunal, and the circumstances would be considered locally?—Quite so.

15,957. And the decision would be given by the tribunal upon the terms of the lease in the light of all the facts?—Yes.

15,958. Is that what you have in view?—Yes.

15,959. I see that you sympathise with the view expressed by Sir Richard Redmayne in his reference to collective production?—Yes.

15,960. May I take it that what you have in view there is the grouping together of certain units of production?—Yes.

15,961. What size of unit have you in your mind?—It might vary, I think. I have no particular size in my mind.

15,962. May I take it that your view is that these are to be units that could be reasonably and efficiently handled?—Yes, and to the best advantage.

15,963. May I take it that within the principle of collective production you have not large units in view?—No, not very large.

15,964. You want them to be such a size that they could be easily controlled?—Yes.

15,965. And that direction within the unit and upon the operations within the unit may be close and effective?—Yes, certainly.

15,966. I see that you expand the view that you started with, with regard to the granting of leases, to the question of wayleaves?—Yes.

15,967. Is it your view that no one should be able to prevent a wayleave being granted contrary to the national interest?—I think so.

15,968. And you also take the view that these wayleaves should be granted on fair and reasonable terms?—Yes; and, of course, I may say that, as you know, we are having to go deeper nowadays for coal in Scotland, and in recent years properties have been slumped to be worked by one or more pairs of pits, with no one charging any wayleave at all.

15,969. That would be inevitable?—Yes.

15,970. Because there would not be a sufficient area really in the one property to justify the sinking of a large sum of money?—That is right.

15,971. Therefore, where you have community of ownership like that, that is going to be benefited by one sinking, the whole ought to be regarded as one leasehold?—Quite right.

15,972. And set free to be operated upon as if it were in the hands of one proprietor?—Yes, and that is being done now.

15,973. In the case of wayleaves as in the case you suggest, merely that there should be some right of property?—Yes.

15,974. So that any unreasonable holder should be put right, and that the coal should be set free in the national interest?—Quite so.

15,975. Can you give any reason why the Lordships in Scotland on the whole are higher than they are in other parts of the country?—I do not know that I know beyond that they have to pay local rates and taxes.

15,976. The Chairman asked you as to the number of leases where the sliding scale principle applied?—Yes.

15,977. I think you gave the reply that you were not quite certain as to the number, but may I take it that these sliding scale arrangements are more common in Scotland than they are in other parts of the country?—I think they are. I may say that my firm act for something like 100 proprietors in Scotland, and I took out the figures of some 21 of them at all events in my own office that are on the sliding scale principle, and there are probably a few more. That is why I said they were probably less than half; that is 21 out of 100, or perhaps a little more.

15,978. May I have your personal views as to whether you think the principle of a sliding scale is a sound principle?—I think it is out of date.

15,979. I am not sure that it is out of date in practice?—No.

15,980. But I take it that what you mean is that as a sound principle it is out of date?—Yes; and we are changing it, as you know.

15,981. I take it that your view would be that there ought to be a return as soon as possible to a fixed lordship which would be fair in all the circumstances?—Yes.

15,982. Have the minerals in the mineral areas in Scotland been readily taken up?—Oh yes.

15,983. Do you know of any considerable mineral area in Scotland that is not occupied at the present time?—I do not know of any holding up of minerals at all, I think.

15,984. Would it be your view that if any valuable mineral area was known to exist in Scotland it would be rapidly taken up?—There is a tremendous demand, and has been for the last few years, for all the areas that have not been taken up.

15,985. Has there not been a steady demand over a large number of years?—Yes, there has.

15,986. And has not the demand for mineral areas simply kept pace with the industrial development, so that the output of coal might meet that development?—I think so.

9 May, 1919.]

MR. JOHN DAVID McLAUCHLAN.

[Continued.]

15,987. Would it be your view that you cannot develop a mineral field in advance of the industrial development?—It would be a mistake.

15,988. Neither a private individual nor the nation could do that?—No.

15,989. It has to work in the mineral development side with the general industrial development that is taking place?—Surely.

15,990. As far as Scotland is concerned, is it your view that all mineral development has taken place in that way?—Yes.

15,991. And, of course, it has taken place due to indirect initiative and enterprise?—Yes.

15,992. There have always been individuals who have been prepared to come forward and take the risk?—That is my experience.

15,993. Is it your view that they have accepted very big risks?—Sometimes.

15,994. Do you know quite a large number of cases in Scotland where losses have been incurred?—Yes.

15,995. And where mineral enterprise has been embarked upon which has proved quite a failure?—Yes.

15,996. And considerable sums of money have been lost?—Yes.

15,997. The losses in these cases have fallen on the individual?—They have.

15,998. Where the mineral lessees make profit the State has benefited?—Undoubtedly.

15,999. And very considerable contributions have been made to the Exchequer in the direction of taxation upon the profits that have been made?—Yes.

16,000. I see that in your *précis* you indicate that if improvements can be introduced, these improvements should be introduced?—Yes, I think so.

16,001. And you make a suggestion with reference to the methods of coal getting?—Yes.

16,002. I take it that what you have in view, particularly, is a reference to coal cutting machinery and conveyers?—Yes.

16,003. Has Scotland not made a remarkable advance in the introduction of coal cutting machinery?—Yes.

16,004. Is it not ahead of the rest of the country in that respect?—I am afraid I cannot compare it with England, not having the knowledge.

16,005. I was wondering whether you could give any idea as to the proportion of coal got in Scotland by coal cutters as compared with the quantity cut by hand?—No.

Chairman: I think in 1916 the number of coal cutting machines in Scotland was 987. The next highest figure is Yorkshire and North Midland, 802.

16,006. *Sir Adam Nimmo*: The point I wanted to get from you as an experienced mining engineer was that the mining industry in Scotland has been essentially progressive?—Yes, certainly.

16,007. And has taken advantage as it has gone along of all the skill and knowledge that have been at its disposal?—Most certainly.

16,008. It has taken that knowledge and skill both from the mining engineers, and from the mechanical engineers?—Quite so, and the electrical engineers.

16,009. And that when the mechanical and electrical engineers were able to put facilities in their hands the coal owners have readily taken advantage of them?—They have.

16,010. You would not agree would you, as a mining engineer of great experience in Scotland, that the mining industry there is in an inefficient condition?—No.

16,011. You would agree that there are a great many very skilled and intelligent people associated with it, if I may say so?—I do agree.

16,012. And a great deal of enterprise has been put into the industry?—Yes.

16,013. Do you think that it could be regarded as appropriate to apply the words "wasteful" and "extravagant" to the mining industry of Scotland?—I do not think so.

16,014. You would think that was wrong?—Quite.

16,015. Now regarding the basis of valuation, I think you have made the position perfectly clear, the

underlying principle being this, I take it, that you have to deal with each separate case by itself?—Yes.

16,016. Would you agree that the simplest way of getting at the question of valuation would be to deal with it through some tribunal?—Yes, probably.

16,017. A tribunal specially set up for the purpose?—Yes, unless, of course, the matter could be arranged without going to the tribunal.

16,018. That is to say, failing agreement?—Failing agreement.

16,019. In the event of any difficulty there should be a reference to a tribunal?—Yes.

16,020. Which would be fortified with all the local information and facts necessary to make a true valuation?—Yes.

16,021. No general average can be dealt with in a matter of this kind?—I do not think so.

16,022. Now coming to another set of questions, I see that you say on page 4 of your *précis* that mineral owners should be controlled to a certain extent by the State in order that our mineral resources might be made the most of, and developments be properly designed and carried out. You are aware that we have heard a good deal, not only about the holding up of coal contrary to the national interest, but the loss of coal contrary to the national interest. Do you agree that some kind of machinery is desirable to solve these problems in the national interest?—Yes.

16,023. May I put it to you that it is not necessary to nationalise either the minerals or the collieries to bring about such a result?—I think so.

16,024. The Chairman asked you as to the form of machinery that you would adopt to meet that class of problem. May I suggest to you this, and ask you, do you approve or not that if you had some kind of national tribunal or sanctioning authority with sufficient powers to deal with these problems, that that would be an easy way of dealing with the matter?—I think so.

Chairman: Would you ask if he means national to Scotland and national to England?

Sir Leo Chiozza Money: Is that the meaning?

16,025. *Sir Adam Nimmo*: No; what I suggest is this. Assuming that it was proposed that there should be one national sanctioning authority, that is to say, for the whole country—Great Britain. That sanctioning authority would stand over the whole national situation from the point of view of this class of problem, and other problems?—I suppose it would, but it might be better to have one for each country.

16,026. What has been suggested is that within the operations of that Sanctioning Authority, or rather working side by side with it, there should be a representative mining council in a Department of State entrusted with the dealing of the mining questions of the country?—Quite so.

16,027. Would you consider that desirable from the point of view of getting full information upon all the problems involved?—I think you must have full information certainly.

16,028. And that if this sanctioning authority which was appointed for the United Kingdom as a whole relied upon the information or upon the initiative of this representative mining council, that we would get at the results that we desire in the setting free of this coal in the national interest?—Yes, I think it would.

16,029. *Chairman*: May I ask whether the sanctioning authority is to be peripatetic or fixed, that is to say, whether it is to be fixed to a place like London, or whether it has to go about the country like the Railway Commissioners?—I think it would be a mistake to have it fixed.

16,030. It ought to be peripatetic?—I think so.

16,031. *Sir Adam Nimmo*: What I take it would be the case would be that on the panel of this sanctioning authority there would be individual commissioners who would go to the part of the country where a particular problem had to be dealt with. Do you see any difficulty in making arrangements for co-opting upon such a body certain local authorities—I mean, local authorities in the sense of

9 May, 1919.]

MR. JOHN DAVID McLAUCHLAN.

[Continued.]

experts who would know the whole of the local circumstances?—No.

16,032. And who would be able to advise within the local circumstances?—I see no difficulty.

Sir L. Chiozza Money: I am unwilling to interrupt, but may I ask do you mean that the peripatetic council or authority would travel about as it were, and pick up local advisers to assist it?

16,033. *Sir Adam Nimmo*: No, but in dealing with any local case they would draw necessarily upon local expert advice?—I think they would have to.

16,034. So as to deal with the problems in a particular locality?—Yes.

Mr. Leslie Scott: You will find the full details of the local authority in the Land Acquisition Committee's Report.

Mr. Herbert Smith: I object to this interruption.

Mr. R. H. Tawney: I think as the cross-examination is on this scheme it would be better if we had the scheme before us. We should then know better what he is talking about. As it is the cross-examination goes on on a scheme the details of which we know nothing about.

Sir Adam Nimmo: I should be very glad if the scheme might be put into the hands of the witness, and that he might have an opportunity of looking into it, and saying at a later stage whether he approves of it.

Sir L. Chiozza Money: Could the Commissioners have it?

Sir Adam Nimmo: I thought the Report was before the Commissioners.

Chairman: There is an interim report.

Mr. Leslie Scott: I can tell you all about it.

Chairman: Would you like to give evidence?

Mr. Leslie Scott: It seems ridiculous that the Commissioners should object to my saying anything.

Mr. Herbert Smith: I am objecting to your doing anything of the kind.

Chairman: Mr. Herbert Smith is quite right.

Sir L. Chiozza Money: Is it competent for a layman to get up and toll the Commission that its proceedings are ridiculous?

Mr. Leslie Scott: I am Counsel.

Chairman: In my view it is not competent.

16,035. *Sir Adam Nimmo*: The principle I want to draw your attention to in dealing with these problems of barriers, wayleaves and coal left in contrary to the national interest, is this, that a national tribunal should be set up to which application should be made, either by an individual or by corporations or by this central mining Council to which I have referred, and the tribunal would be invited in the light of the facts submitted to it to say whether the coal should be worked or not, and upon what terms it should be worked—assuming some such scheme as that would you consider it adequate to deal with the class of problem that has been referred to?—I think so.

16,036. Without requiring either the nationalisation of mines or of minerals?—Yes.

16,037. I take it that your preference would be decidedly in favour of some such scheme?—It would.

16,038. If it could be worked out?—Yes.

16,039. Your desire, I take it from your *précis*, being this, to secure entire freedom of movement, or as much freedom of movement as possible on the side of the means of production?—Yes.

16,040. Do you think it would be quite a proper thing to refer to a Central Mining Board the original lay-out of a mineral field?—It might be necessary, and it might not.

16,041. In your *précis* you make reference to the fact that sometimes the fields are not laid out from a truly national point of view?—What I mean is this: in Scotland we have to lay out our operations as we can. Our fields are so much troubled with faults and dislocation of the strata that your plans get upset; you have to alter them, and you feel your way through. Then you think of a new scheme to improve

matters, and it all depends on what coal you have left as to whether that would pay or not. It might not pay to do what has to be done.

16,042. A central Mining Council such as I have referred to might be most helpful in dealing with a problem like that?—Yes, certainly.

16,043. Going beyond making suggestions only, they might be put in a position to make an application to the sanctioning authority to carry it out?—Yes.

16,044. Going off for a minute to the position in Scotland with regard to granting mineral leases, do all the mineral leases provide for the scientific working of the coal?—Yes.

16,045. Mining engineers go out of their way to insert such provisions?—We do our best.

16,046. You desire not only to see the whole of the coal exhausted, but to see that it is exhausted in a proper manner?—Yes.

16,047. Do you do your best to put in all the necessary provisions to secure that result?—Yes.

16,048. Do you insist upon the workings being carried on upon the level of the present experience and with the skill and knowledge that are available at the time?—We do.

16,049. Are the workings regularly inspected by the mining engineers for the proprietors?—They are.

16,050. They are regularly, therefore, under the criticism of those engineers?—Every quarter they are. The plans are filled up by the engineers' surveyors, and every quarter the plans are examined by the engineer to see what is going on. He himself inspects the workings once a year, or something like that.

16,051. So that he knows whether any coal is being left in?—Yes.

16,052. And whether it is being left in improperly?—Yes, quite so.

16,053. He would be very anxious to secure that the fullest possible quantity of coal is taken out?—Certainly.

16,054. Do you think a good deal of misunderstanding exists in regard to the quantity of coal that is said to be lost in barriers and through waterlogged areas?—I think so.

16,055. Loss of efficiency?—Yes.

16,056. You think so?—Yes.

16,057. May I take it from you that this, at any rate, is correct, that the extent of the problem is not known?—It is not known, I think.

16,058. That any figures which are submitted with regard to these losses must be more or less problematical?—I cannot tell how they have been got.

16,059. Further, is it not the case that you cannot tell in any individual case whether the barrier can be taken out or not?—You often see a barrier on a plan that is not there at all.

16,060. I suppose you would agree that in a great many cases barriers will be found to be necessary, whether the mines are owned by individuals or by the nation?—Certainly, you cannot send all the water to one spot; you must plan things out and deal with it to the best advantage.

16,061. I suppose you may also require to keep barriers for ventilation?—Certainly.

16,062. Therefore, when you come to deal with this problem at close quarters, you must look after each individual case?—You have to look after the safety of the men.

16,063. And decide, in the light of the particular circumstances, what can be done?—Yes, certainly.

16,064. I see that in your *précis* you make quite a strong declaration that you are not in favour of the nationalisation of the mines. Have you made up your mind, from your experience, that we may not expect more coal for the nation through nationalisation?—I think so.

16,065. Is it your view that that coal will not be produced as cheaply as it was produced under private enterprise?—It depends on how it is done. If they concentrate, as I say in my *précis*, on certain mines, that may cheapen the production for a time, but it would be a very bad thing for the country and for the miners.

16,066. And if we were not to get more coal, and we were to get all the coal we did get at a higher

9 May, 1919.]

MR. JOHN DAVID McLAUCHLAN.
